Despite these controversies, many states are moving ahead and authorizing private corporations to engage in the full-scale operation of prisons. By the end of 2000, 5.8% of all state inmates were housed in privately operated facilities.^[19] Several studies have reported that private prisons outperformed their public counterparts on several dimensions of quality (e.g., care, safety, security, order) and that they accomplished this at a reduced cost.^[59–61] Camp and Gates report that

these evaluations failed to statistically control for factors (e.g., age and race of inmates, staff-to-inmate ratios) that could influence the research outcomes and that their findings should be reviewed with caution.^[62] Based on a comprehensive review of the available research on privatization, the Bureau of Justice Assistance concludes that: privately operated prisons function at least as well as publicly operated prisons; private prisons can reduce costs in markets that have high benefits for public employees; there is evidence to suggest that private corporations can build prisons faster and cheaper than the public sector; and the presence of private prisons has prompted public facilities to develop cost-saving strategies.^[63] Although they are not overly supportive, these conclusions certainly favor the continued inclusion of the private sector in the operation of prisons.

Structured Decision Making

Shrinking resources and a demand for equitable and appropriate decision making have led to an increased interest in strategies that structure the discretion of judges and correctional personnel.^[64] Sentencing guidelines and case classification systems have emerged to guide decision making in a way that minimizes disparities and reserves scarce prison resources for the most dangerous offenders.

Sentencing guidelines

The introduction of sentencing guidelines in the late 1970s represents one of the most salient efforts to interject accountability into the criminal justice system. As of the end of 1999, 18 states had implemented sentencing guidelines, 4 states were considering proposals for guidelines, and 3 states had appointed commissions to study the approach.^[65] The initial aims of sentencing guidelines were to promote proportionality and reduce disparity in sentencing by prescribing a punishment that is based on the seriousness of the offense and the criminal history of the defendant rather than on extralegal factors like race and sex.^[66,67] Increasingly, however, states (e.g., Minnesota, North Carolina, Utah) have included mechanisms within their sentencing guidelines for linking sentences with correctional resources.^[68]

In 1994, North Carolina introduced sentencing guidelines that were based on projections of future crime and sentencing patterns, and matched sentences to the number of prison beds, probation slots, and other correctional resources. The guidelines called for shorter and community-based sentences for non-violent, first time offenders and longer sentences for violent and career offenders. Preliminary results suggest that the

plan is working with a greater percentage of serious felons serving longer than average prison terms and an increased use of non-prison punishments for less serious felons.^[69] The North Carolina Legislature has demonstrated its commitment to these “capacity-based guidelines” by requiring that a fiscal impact statement accompany any recommended revisions to the guidelines.

Case classification

Whereas sentencing guidelines attempt to control judicial discretion and the inputs to correctional systems, case classification systems attempt to guide the discretion of correctional personnel themselves. Classification systems are designed to categorize offenders based on specific behavioral or psychological dimensions and to facilitate the placement of offenders into appropriate programs or facilities.^[70] A well-designed classification system can minimize bias in correctional decision making and promote more efficient use of resources.

The dominant focus of case classification is on predicting offenders’ risk of recidivism or their risk to institutional security.^[71] The methods of risk prediction have evolved over the years from a more subjective form of clinical assessment based on professional judgment to actuarial risk assessment based on objective and standardized instruments.^[64] These instruments include items that are known to be associated with recidivism or institutional misconduct (e.g., age at first arrest, prior criminal history). Although variations exist, the basic process for actuarial risk assessment is the same: Correctional personnel use information gathered from the offender’s case file and/or a structured interview with the offender to assign a score on each item depending on the degree to which the risk factor is present; the individual item scores are then summed for an overall risk score; and this score is used to categorize offenders as low, medium, or high risk. Depending on the offender’s categorization, s/he is placed in a minimum, medium, or maximum level of community supervision or facility. Risk assessment can assist agencies in managing offenders’ risk through the application of control-oriented measures (e.g., surveillance, curfews, electronic monitoring), and, more importantly, in planning for more effective interventions to reduce the probability of recidivism or institutional misconduct.

Developing Research-Based Interventions

A quick perusal of the recidivism rates previously reported for probation and parole perpetuates the “nothing works” mentality propagated by Martinson. A closer examination of outcome studies, however,

provides a more optimistic perspective on the effectiveness of correctional programming.

Over the past two decades, numerous authors have conducted literature reviews and meta-analyses to examine the effectiveness of various correctional interventions. These reviews directly challenge Martinson's conclusion that "nothing works" in correctional programming: About 60% of the studies reviewed reported a reduction in recidivism with the average reduction being 10%.^[72] Even more promising, programs that met certain principles of effective intervention were shown to reduce recidivism by 30 to 50%.

The programs that have lead to the largest reductions in recidivism possess several common characteristics.^[73-76] The most effective programs were conducted in the community,^[75-78] included multimodal programming,^[72,76,79,80] and involved the family in the offender's treatment.^[79-81] Other more specific characteristics that have been identified have been referred to as "the principles of effective intervention."^[73,74,82] They include:

1. Effective interventions are behavioral in nature. A well-designed behavioral program combines a system of reinforcement with modeling by the treatment provider to teach and motivate offenders to perform prosocial behaviors. Additionally, problem solving and self-instructional training may be used to change the offender's cognitions, attitudes, and values that maintain antisocial behavior.
2. Levels of service should be matched to the risk level of the offender. Intensive services are necessary for a significant reduction of recidivism among high-risk offenders, but when applied to low risk offenders, intensive services produce a minimal or negative effect.
3. Offenders should be matched to services designed to improve their specific criminogenic needs such as antisocial attitudes, substance abuse, family communication, and peer associations. Improvements in these areas will contribute to a reduced likelihood of recidivism.
4. Treatment approaches and service providers are matched to the learning style or personality of the offender. For example, high anxiety offenders do not generally respond well to confrontation,^[83] and offenders with below-average intellectual abilities do not respond to cognitive skills programs as well as offenders with above average or high intellectual abilities.^[84]
5. Services for high-risk offenders should be intensive, occupying 40 to 70% of offenders' time over a 3- to 9-month period.
6. The program is highly structured, and contingencies are enforced in a firm but fair way: Staff

design, maintain, and enforce contingencies; internal controls are established to detect possible antisocial activities; and program activities disrupt the criminal network and prevent negative peers from taking over the program.

7. Staff relate to offenders in interpersonally sensitive and constructive ways and are trained and supervised appropriately.
8. Staff monitor offender change on intermediate targets of treatment.
9. Relapse prevention is employed in the community to monitor and anticipate problem situations, and to train offenders to rehearse alternative behavior.
10. High levels of advocacy and brokerage occur if community services are appropriate.

The research on "what works" in correctional interventions provides a powerful agenda for correctional programming, one that holds agencies accountable for achieving the bottom-line results that the public expects—a reduction in recidivism.

CONCLUSION

Years of politically motivated policies have strained the correctional system beyond its capacity. Prison crowding and large probation and parole caseloads make it nearly impossible to provide offenders with the type of supervision and services that are needed to reduce their likelihood of returning to crime. Yet that is what the public expects from corrections—to be kept safe from offenders. Knowing that their credibility depends on meeting this expectation, correctional agencies are working hard to meet the challenge. Through community justice initiatives and the privatization of prisons, correctional agencies are expanding resources and developing valuable partnerships. Through sentencing guidelines and case classification systems, correctional agencies are better equipped to allocate resources in a fair and equitable way and are able to reserve scarce prison space for the most dangerous offenders. And for the first time ever, through ongoing research, corrections agencies have a blueprint for developing programs capable of reducing recidivism. These proactive initiatives suggest that, despite the political context within which correctional agencies operate, there is hope for a more rational approach to managing state corrections policy.

Council/Commission Representation

Tari Renner

Department of Political Science, Illinois Wesleyan University, Bloomington, Illinois, U.S.A.

INTRODUCTION

How well do local government legislatures (city councils and county commissions) reflect the interests, opinions, and characteristics of their communities? This article provides an overview of the empirical research on the linkage between elected local officials and constituents. Given their particular importance, the focus is primarily on the impact of varying electoral structures used to choose elected representatives.

The legislative bodies of cities and counties have a central place in the processes of popular representation, democratic governance, and accountability in their communities. Unlike their counterparts at the state and federal level, local legislatures are unicameral and rarely have to contend with a powerful separately elected executive who has veto power over their actions.^[1] Legislative bodies in cities are most commonly referred to as councils, but a small number may use the titles of board, selectmen, or trustees. The most common name of county legislatures is commission, followed by council and board.

OVERVIEW

The procedures for electing representatives to city and county legislative bodies vary widely between the two types of local governments. The overwhelming majority of cities use non-partisan elections. The latest city form of government survey by the International City/County Management Association (ICMA) puts the figure at 76%. Alternatively, the overwhelming majority of counties use partisan ballots (82% in the latest ICMA survey of county forms of government). There is also a distinct difference between the two types of local governments in the distribution of at-large, district, and so-called mixed systems. At-large systems have representatives elected from the entire jurisdiction. In contrast, district systems have legislators elected from different areas of the city or county. The mixed systems have some legislators elected communitywide (at-large) and some elected from individual districts. A clear majority of American cities use at-large elections, whereas few use districts. The latest figures from the ICMA indicate that approximately 60% of cities have at-large elections and less than 20%

have district elections (the remainder report having combination or mixed election systems). In contrast, nearly one-half of counties report having district elections and only one-fifth elect their legislatures at-large. Cities, therefore, are more likely than counties to have so-called reformed electoral systems (promoted by the structural reform movement in the late nineteenth and early twentieth centuries).

The federal Voting Rights Act prohibits the use of racially discriminatory election procedures by both state and local governments. In fact, jurisdictions with a history of discrimination, disproportionately in the South, must have any changes in their election rules and procedures “precleared” by the U.S. Justice Department or the federal district court in Washington, DC, *before* they can go into effect. Although the most overt forms of racial discrimination are largely a thing of the past, election systems can have subtle discriminatory effects that inhibit or “dilute” minority strength. At-large elections, for example, may permit a White majority to consistently elect *all* members of a council over Black minority opponents. When faced with such a case in *City of Mobile v. Bolden*, 446 U.S., 55 (1980), the Supreme Court stated that in order for an electoral system to be overturned under the Voting Rights Act, it must be established that there was some *intent* to discriminate by those who established the structure. The demonstration that an election procedure had discriminatory consequences was not deemed by the court to be sufficient to invalidate the system. In response to this case, the 1982 amendments to Section 2 of the Voting Rights Act make it clear that laws that *result* in diluting minority representation are just as impermissible as those accompanied by discriminatory *intent*. As amended, Section 2 states that an electoral system is invalid if, based on a totality of circumstances, it is apparent that minorities will have fewer opportunities than others to participate in the electoral process and elect representatives of their choosing. The factors to be considered in making this determination include the degree of historical discrimination in the community; the degree of racially polarized block voting; racial appeals in political campaign rhetoric; the proportion of minorities elected to public office (although the Supreme Court in *Thornburgh v. Gingles*, 106 S.Ct. 2752, 1986, made it clear that minorities do not have

a right to have a fixed percentage of elected positions in any legislative body); and the extent to which there is responsiveness to minorities on the part of public officials in a community. These legal changes are largely responsible for the decrease in the use of at-large elections by local governments in the late 1980s.^[2]

The body of academic literature examining the interactive effects of local government election systems on the linkage between minority population percentages and minority representation on elected councils is quite clear. Beyond a certain population threshold (usually 15% or 20%), district and mixed systems tend to facilitate minority representation, whereas at-large systems tend to inhibit minority representation in both cities^[3] and counties.^[4] These systematic patterns persist despite anecdotal evidence that minorities can win in a progressive political environment with at-large elections.^[5] There is also evidence that racial minorities living in communities with district elections have higher levels of political efficacy than those living in communities where councils are elected at-large.^[6]

The extent to which elected councils and commissions are demographically representative of their constituencies (sharing similar distributions of race, ethnicity, gender, income, and education levels) is only one component of the broader concept of representation. Hanna Piktin^[7] referred to this as descriptive representation. In addition, she identified another form—substantive representation—which refers to the extent to which the policies supported by elected representatives are in the interests of their constituencies. Eulau and Karps^[8] referred to a similar type of representation as policy responsiveness. To illustrate the basic distinction between the descriptive and substantive concepts, a Hispanic commissioner who represents a majority Hispanic district might provide good descriptive representation but poor substantive representation if the commissioner voted against policies or programs that were in the best interest of their constituents.

A central question linking the two concepts is “what is the substantive effect of more equitable descriptive representation?” Some academic literature suggests that Black representatives can modestly change local hiring practices and spending priorities, whereas others suggest the change in the Black community is negligible.^[9,10] Research by Zolton Hajnal,^[11] however, focuses on the White community. The project concludes that Black representation in local government tends to decrease racial tension and increase White support of Black elected leadership, although White Republicans were “largely immune” from these effects.^[12] “Once an African American is elected, . . . whites obtain important information about the effect black representation on their lives. They can now base their assessments on an incumbent’s record rather than

on stereotypes, exaggerated fears, or the incendiary predictions of white opponents.”^[13]

Welch and Bledsoe^[6] explored two additional aspects of representation in their analysis of a national survey of city council members. These include representational focus and service representation. The former refers to whom council members or commissioners believe they should represent (a geographic area of the community or neighborhood, a racial or ethnic constituency, a partisan or ideological constituency, the city as a whole, a single issue group, a business or labor constituency, etc.). Service representation, however, refers to how commissioners or council members view their roles in providing constituency service.

Welch and Bledsoe’s data on representational focus indicated that council members who are elected from districts are more likely to report that a particular geographic area or neighborhood is more important to their representation than council members who are elected at-large. The latter are, however, the most likely to report that they focus on the city as a whole or a business constituency. In service representation, the data indicate that at-large council members devote less time to constituency service or ombudsman activities than district members and are less likely to report that their constituents expect personal service. This relationship persisted even after the size of the constituency served was controlled.

In their analysis of policy or substantive representation, Welch and Bledsoe found that there were no statistically significant differences in policy attitudes between council members elected under different structures. However, councils with district elections were engaged in more conflict than those elected at-large. In addition, the nature of the conflict differed because district councils were the most likely to report that their disputes were geographically based. Predictably, the data indicated that councils elected with party labels on the ballot had more partisan conflict than those elected in non-partisan systems. However, it appeared that partisan conflict on the council made both the partisan and non-partisan issues more salient to the public.

In descriptive representation, Welch and Bledsoe’s data indicated at-large council members tend to have higher incomes and education levels than those elected by district. This provides additional evidence to suggest that district elections facilitate council demographic diversity. Non-partisan elections were found to result in more upper-income council members and Republicans. The partisan bias of non-partisan systems, in favor of Republicans, has been documented in earlier academic literature.^[14,15] In Welch and Bledsoe’s data, however, non-partisan elections only advantaged Republicans when they were also elected at-large. District systems, in other words, eliminated the partisan bias of non-partisan elections.

Few, if any, city councils or county commissions can claim to be fully representative of their constituencies. Those in the least affluent stratum of society, likely to be disproportionately Democratic in political identification, are underrepresented in every type of electoral system. However, the literature demonstrates quite clearly that "some kinds of structures block representation of these groups more than do others."^[16] Research on cumulative voting in American local elections by Bowler, Brockington, and Donovan^[17] concluded that all plurality/majoritarian election systems tend to depress voter participation. They found that cumulative voting encourages voter mobilization and turnout.

Since the 1990s, it appears that city councils and county commissions are becoming somewhat more demographically representative of their constituencies. Susan MacManus,^[18] for example, found that from 1988 to 1996, the percent of city council members who were black increased from 4.1% to 5.5%. She also found that the percentage of women increased from 15% to 21% over the same period. Women were found to be most prevalent in the largest cities with racially and ethnically diverse, and more affluent and highly educated, populations. On county commissions, the trend toward gender diversification was even stronger. In the 1988 national survey by the ICMA, only 9% of county legislators were women, compared with 29% in the organization's 1997 questionnaire. Comparable data on the racial change in county legislatures are not available because the ICMA dropped the race question from its most recent survey.

In the early 1990s, a term limits reform movement was successful in adopting their agenda through popular referendum. These reforms appear to be an effective strategy to ensure that the tenure of elected officials is limited and, therefore, that turnover is maximized. The core assumption seems to be that policy-making bodies need constant membership change to remain responsive because over time incumbents become increasingly insulated from their constituent's interests. There is, however, little empirical evidence to support this assumption in local legislatures. Data from ICMA indicate that few city council or county commission members are term limited (less than 10%), yet, there appears to be a great deal of turnover in these positions. Nearly one-half of all city council members were reported to be serving their first term.^[19]

CONCLUSION

The linkage between constituents and their elected local representatives is a complex and multifaceted phenomenon. The existing academic literature has focused primarily on so-called descriptive representation,

the correlation between elected officials' demographic characteristics and those of their respective constituencies. The conditioning or interactive effects of election systems on this relationship have also received considerable scholarly attention. The available longitudinal data indicate that city councils and county commissions have experienced trends toward greater demographic representativeness over the last decade as minorities and women have increased their presence in these bodies. Comparatively little research exists, however, on the degree of substantive representation in local legislatures. There is no systematic evidence, for instance, on the congruence between constituency ideological characteristics and the roll call voting of representatives, which is common in the literature at the national level. The existence of thousands of jurisdictions and councils with various forms of record keeping means that such data would be extremely difficult, if not impossible, to collect. Future research could fill this gap by exploring the other dimensions of representation through elite surveys similar to those used by Welch and Bledsoe.^[6] However, all aspects of local legislative representation need continuing scholarly attention. Comparatively high membership turnover on these councils suggests that all facets of the representation nexus will be dynamic over time.

County Government

J. Edwin Benton

*Department of Government and International Affairs, University of South Florida,
Tampa, Florida, U.S.A.*

INTRODUCTION

County governments are perhaps the oldest and most familiar units of local government in the United States. Currently, there are 3034 county governments or their equivalents^a in 48 of the 50 states. (Rhode Island and Connecticut abolished county governments in 1842 and 1958, respectively.^b) The number, size, and population of counties vary considerably. While the number of county governments per state ranges from three in Delaware to 254 in Texas, the geographic area of counties can be as small as 46 mi² (Hudson County, New Jersey) or as large as 89,783 mi² (North Slope Borough, Alaska).^[1] The typical county covers an area of 600–700 mi².^[1] In 2002, the average population served by county governments was 83,075, but this ranges from 67 in Loving County, Texas, to over 9.5 million in Los Angeles County, California.^[1] Around 15.6% of all county governments in 2002 ($N = 473$) serve populations of 100,000 or larger, with 201 of these counties in 40 states containing 250,000 or more inhabitants.^[1] But, 71.8% of all American counties ($N = 2178$) serve populations of less than 50,000 persons, with 700 of them containing fewer than 10,000 persons.^[1] Finally, some counties (e.g., Hernando and Orange in Florida) have experienced a tremendous growth in their population (over 100% in Hernando since 1990), while the population in counties in some states, such as Iowa and West Virginia, has remained unchanged or even declined.

To better understand what county governments are and what they do, the remainder of this entry is divided into three parts: 1) a brief history of the development of counties; 2) a description of county government structure; and 3) an overview of the roles counties play as service providers.

HISTORICAL DEVELOPMENT OF COUNTY GOVERNMENTS

County governments were originally established to serve the needs of their state. From the outset, county

governments were viewed as instruments by which their state governments could ensure the delivery of essentially state programs at the local level. The administration of public welfare and health-care programs; provision of roads, bridges, and highways; operation of court systems; maintenance of law and order; supervision of elections; tax assessment and collection; and furnishing agricultural information are examples of state services or services of statewide concern for which counties are responsible. Because of the role that county governments were to play, they frequently have been referred to as political or administrative subdivisions of their state government.

In spite of this general view of the purpose and functioning of county governments, counties developed differently in different parts of the country. To a large extent, the powers that county governments exercise and the functions they perform today—in short, the form of county government that was created—can be traced back to the needs of the settlers of the southern, northern, and middle colonies.^[2–4]

Those states that adopted the model of the Virginia colony (primarily southern states) developed a strong system of county governments. Southern colonies required a form of government that could effectively respond to the needs of a society consisting mainly of plantations, farms, and small agricultural communities. In fact, the wide geographical dispersion of the population in most southern states made the English strong county model a suitable form of local government. Therefore, county government became the primary unit of local government, through which the state guaranteed the coordination and provision of many state services (e.g., welfare, health care, roads, courts, and public safety) at the local level.

By contrast, counties in the northern part of the nation (New England) historically were vested with fewer powers and responsibilities and consequently played a much less important role in the lives of residents of these colonies (later to become states). For the most part, states in this region traditionally relied much more frequently on municipal governments and townships, and even special districts, than on county governments to provide state services and programs to citizens at the local level. This arrangement was a result of the fact that most New England states followed the example set by the Massachusetts Bay

^aIn Alaska, they are referred to as boroughs, while they are called parishes in Louisiana.

^bSince 1997, Massachusetts has abolished nine of its 14 country governments.

Colony, where towns, cities, and townships were established before counties. Therefore, many of the functions and responsibilities that were assigned to counties in the southern colonies were given, instead, to these other units of local government. Because county governments never attained the level of importance in this region of the country as they did elsewhere, Rhode Island and Connecticut eventually abolished their county governments, and more recently, counties appear to be headed for extinction in Massachusetts.

The middle colonies of Pennsylvania, New Jersey, and New York established local governments different from those found in the southern and northern colonies. Cities and towns in New York and New Jersey, like in the New England region, were the primary units of local government. Townships also were established and played an important role. However, county governments were not only established in New York and New Jersey, but they were given substantially more responsibilities. County government in Pennsylvania developed even differently from that in New Jersey and New York. County governments in that state were intentionally established as the primary unit of local government and, hence, developed as important administrative units before cities and towns. Townships were also created in Pennsylvania, to help counties in the provision of services on a level larger than the city or town but smaller than the county.

As the nation expanded westward, the other 37 states that were to eventually join the Union looked to the original 13 states for guidance when creating a system of local government. The model of the southern states, whereby counties became the central focus of local governance as well as the principal agents of service delivery, was adopted by many of the western states. The example set by the states of the Middle Atlantic region was most influential in the scheme of local governance that was created in many states in the Midwest. Here, county governments developed as important political entities, although not to the extent found in southern states. No future state, however, adopted the model set by New England states, where county governments were insignificant units of local government.

STRUCTURE OF COUNTY GOVERNMENT: TRADITIONAL VS. MODERNIZED

To understand the manner in which county governments are structured, one must recognize that counties are legally “creatures of the state.” Emphasizing this fact, the U.S. Supreme Court in the case of *Maryland vs. Baltimore and Ohio Railroad* (1845) held that “the several counties are nothing more than certain portions

of the territory into which the state is divided for a more convenient exercise of the power of government.” Later, in *Merriam vs. Moody’s Executors* (1868), the Iowa Supreme Court ruled that local governments, including counties, could exercise only: 1) those powers expressly delegated to them by the state legislature via enabling legislation; 2) those powers necessary and incident to execution of the express powers; and 3) those powers absolutely necessary to discharge the express powers. These two court cases (the latter known as Dillion’s rule) reinforced the principle that county governments were essentially administrative districts of the state. Therefore, it should come as no surprise that the states historically have dictated the structure of county governments. The form of county government that resulted frequently is referred to as a traditional county commission structure.

Although traditional county commission governments may differ noticeably in their organization, they have three distinctive features in common. First, they have a governing (legislative) body usually referred to as the “county commission” (sometimes, however, it can be called the “county board,” “board of supervisors,” or even “board of judges”), which is comprised of anywhere from three to 50 elected members. Typically, there are three or five county commissioners elected for overlapping 4-yr terms. Second, although the governing board may supervise some functions, it generally shares responsibility for the administration of many county functions with a number of separately elected officials with county-wide jurisdiction (usually referred to as “row officers”), such as the sheriff, county attorney, auditor, recorder, coroner, assessor, judge, treasurer, tax collector, and clerk of the circuit court. For instance, the county commission and the elected sheriff share responsibility for the county jail, with the sheriff overseeing day-to-day operations but the commission deciding on its construction, repair, and financing. The commission usually determines the property tax rate to be imposed on property owners (subject to limitations or tax caps or ceilings in the state constitution or imposed by the state legislature). But, the tax assessor determines the value of each piece of property in the county against which the rate is to be applied. And, in some counties, a separate tax collector actually sends out the tax bills and assumes responsibility for collecting revenue, while another separately elected county official (treasurer) may maintain the county’s financial accounts and write checks. Hence, responsibility for the administration of county government functions is fragmented and dispersed and generally beyond the control of one county official or county office.

A third common feature is the existence of a number of special boards or commissions that have authority over various functions, whose members may be elected

or appointed by the county commissioners or may even include the county commissioners in an *ex officio* capacity. Generally, these include such things as welfare, library, zoning, code enforcement, and pension boards; hospital, housing, and sanitation authorities; and water, sewer, and fire districts.

Reformers historically viewed the traditional structure of county government as lacking in efficiency and political accountability. In addition, reformers have lamented the fact that very little local home rule or self-determination exists for county governments, because they are creatures of the state. This means that the local governing body is limited in its ability to respond to public expectations and the service needs of their constituency. While reformers have advocated that state legislatures grant counties greater discretion in local matters as well as give them the authority to adopt more modern governmental structures, an overwhelming majority of all counties still operate under the traditional county commission structure.

In recent years, however, counties have been granted greater discretionary authority or home rule and the opportunity to modernize their structure of government.^[5] Since the early 1900s, 36 states have relinquished substantial control over the internal affairs of counties through the grant of home rule, while another four states have given additional authority in functional and fiscal areas to their counties.^[6] Moreover, some of the 12 states without home rule have granted authority through special legislation.^[7]

The most common type of home rule is charter government, which is available to counties in 24 states.^[7] Charter home rule permits counties to devise and adopt their own charter and basically results in greater autonomy than other types of home rule, particularly in functional and fiscal areas.^[8] While around 120 of the 1307 counties eligible to adopt a charter have done so, 2920 counties (95%) remain general law counties.^[8] As a general rule, urban counties and counties with more affluent, more educated, and reform-minded citizens are more likely to adopt a charter form of government.

While counties have been slow to take advantage of the opportunity to adopt home rule charters, they have been more willing to move toward greater centralization of executive and policy-making authority. To date, over 800 counties have adopted the commission-administrator form of government, and over 400 counties have opted for an elected executive form of government.^[8,9] Moreover, there has been a steady movement by counties to centralize their government by abolishing or merging the elective positions of constitutional officers under the governing board. For instance, a survey of state county associations in 1992 revealed that 19 of 41 responding states reported some kind of change in the status of elected constitutional

officers.^[10] Many states even permit this type of structural change, regardless of home rule or charters.^[5]

These changes have coincided with the willingness of the states to permit counties greater latitude in raising revenue. Specifically, an increasing number of states have granted counties wider authority to implement sales and gas taxes and to levy a variety of fees and charges for services. At the same time, states have substantially increased the amount of state aid to counties and have demonstrated a greater willingness to share a larger proportion of their revenue receipts with counties.^[5] To a large degree, it seems that financial pressures resulting from reductions in federal aid have been responsible for the willingness of states, in recent years, to increase state aid and shared revenues and grant expanded revenue-raising authority to counties.^[5]

COUNTY SERVICES

County governments, regardless of their structure of government, provide three basic types of services—traditional, municipal type, and regional. Traditional services (many of which are mandated) are typically some of the oldest county services and result from the fact that counties are administrative subdivisions of the state and are provided to all county residents. As such, counties are responsible for services that include public welfare, health and hospitals, highways, police, judicial and legal matters, corrections, elections, tax assessment and collection, and public buildings. Municipal-type services (sometimes referred to as “newer” county services) are usually provided to residents of the unincorporated area who expect the county to assure the delivery of a number of services that historically have been provided only by municipalities. These include fire protection, utilities (water, sewer, and garbage collection), libraries, and protective inspections. Like traditional services, regional services are provided to the entire county (that is, to both incorporated and unincorporated area residents). These are services (also frequently referred to as “newer” county services) that deal with service issues that know no political boundaries (e.g., airports, housing and urban development, sewer and solid waste disposal, parks and recreation, natural resource conservation, and transit) and, hence, require a county-wide response.

To gain a better understanding as to the role that county governments play as providers of these three types of services, it is instructive to examine county financial effort. This can be done best by comparing county expenditures over time and, where appropriate, with other units of local governments

Fig. 1 County service proportions, 1962 and 2002. (From U.S. Bureau of the Census. 1962 Census of Government. *Compendium of Government Finances*; Government Printing Office: Washington, DC, 1964; Table 48; U.S. Bureau of the Census. 2002 Census of Governments. *Compendium of Government Finances*; Government Printing Office: Washington, DC, 2005; Table 48.)

(i.e., municipalities, townships, and special districts). The most reliable expenditure data exist for the 1962–2002 time period.

Because county governments were created to serve as administrative arms of the state, it is not surprising that counties historically have devoted the largest proportion of their fiscal resources to the provision of traditional services. As Fig. 1 indicates, counties in 1962 allocated \$9 out of every \$10 for the provision

of traditional services. As of 2002, counties still spend over four times as much to deliver traditional services as they do for municipal-type and regional services. In short, counties continue to be heavily involved in the provision of state services and programs at the local level. Nevertheless, it appears that this role diminished somewhat between 1962 and 2002, while the role as providers of municipal-type and regional services increased.

A comparison of the service role of counties to other local governments provides another perspective. For instance, it can be seen that county governments are the dominant providers of traditional services. In both 1962 and 2002, counties accounted for the largest proportion of all local government funds allocated to the provision of traditional services (see Fig. 2). In fact, the county proportion increased from 47 to 51 between 1962 and 2002.

With regard to municipal-type services, counties tend to play a relatively minor role in their delivery when compared to municipalities and special districts (see Fig. 3). Here again, this finding comes as no surprise, because most municipal-type services (e.g., fire, utilities, protective inspections, and the like) are ones that municipalities typically have provided to their residents. Nonetheless, two important observations should be noted. First, the county government proportion increased from 3% to 8% between 1962 and 2002. Second, the special district proportion increased substantially over this same time period (that is, from 14% to 34%). This is significant, because special districts are frequently created to provide services to some or all county residents when counties are unable or unwilling to provide them. Therefore, it is reasonable to conclude that, to a certain extent, special districts

Fig. 2 Traditional service proportions, 1962 and 2002. (From U.S. Bureau of the Census. 1962 Census of Government. *Compendium of Government Finances*; Government Printing Office: Washington, DC, 1964; Table 48; U.S. Bureau of the Census. 2002 Census of Governments. *Compendium of Government Finances*; Government Printing Office: Washington, DC, 2005; Table 48.)

Fig. 3 Municipal-type service proportions, 1962 and 2002. (From U.S. Bureau of the Census. 1962 Census of Government. *Compendium of Government Finances*; Government Printing Office: Washington, DC, 1964; Table 48 U.S. Bureau of the Census. 2002 Census of Governments. *Compendium of Government Finances*; Government Printing Office: Washington, DC, 2005; Table 48.)

assist counties in their role as providers of municipal-type services.

The greatest surprise comes from the role that county governments play in the provision of regional services. As the data in Fig. 4 indicate, the county government proportion of all local government spending for regional services increased noticeably from 11% in 1962 to 18% in 2002, an increase of 7%. Over the same period of time, the municipal government share decreased by 8%, while the township and special district proportion basically remained unchanged. In short, it appears that in recent years, county governments have been called upon to play a much more important role in the delivery of regional-type services, at the same time that municipalities are finding it more

difficult or are even unwilling to provide some of these services, than they have in the past. Examples would be in the area of airports, sewer and solid waste disposal, and housing.

The role that county governments play in the provision of traditional, municipal-type, and regional services, however, varies considerably across counties. On the one hand, the service role of counties vis-à-vis municipalities, townships, and special districts is greatest among counties in the south and west regions of the country,^[2] in rapid-growth counties (particularly if most of the growth is occurring in the unincorporated part of the county),^[2,11] in metropolitan counties,^[2,11] and in counties that have adopted a charter form of government and have an appointed administrator or

Fig. 4 Regional service proportions, 1962 and 2002. (From U.S. Bureau of the Census. 1962 Census of Government. *Compendium of Government Finances*; Government Printing Office: Washington, DC, 1964; Table 48 U.S. Bureau of the Census. 2002 Census of Governments. *Compendium of Government Finances*; Government Printing Office: Washington, DC, 2005; Table 48.)

elected executive (that is, a reformed structure).^[2,12,13] Moreover, counties tend to play a more important role in the provision of municipal-type and regional services, where their states have assigned more functional responsibility or provided more fiscal assistance.^[2] On the other hand, the service role of counties is much less important in the New England and Middle Atlantic region,^[2] in non-metropolitan counties,^[2,11] in negative- and no- or slow-growth counties,^[2,11] and in states with the traditional commission (i.e., unreformed) form of government.^[2,12,13] In addition, a much smaller county role in the delivery of traditional and regional services is the norm for counties, in which the state assigns greater functional responsibility to other local governments or distributes smaller amounts of state financial aid.^[2] In short, the role of counties as providers of the three types of services can vary significantly from region to region, from state to state, and even from county to county in the same state.

CONCLUSION

In addition to being the oldest form of local government in the United States, counties are perhaps the least understood. This is probably the result of the multiple expectations that we have for these units of government and the different service roles they are required to play. Although originally created to serve as administrative subdivisions of the state, they are frequently expected to provide municipal-type services to the vast numbers of unincorporated areas' residents and provide an increasing menu of services with regional implications to all county residents. In fact, county governments probably touch the lives of individuals more frequently than any other unit of government in the United States. Sometimes, counties are seen as assisting the state in the delivery of state programs and services, and at times, they are seen as trying to perform like municipalities. And, at still other times, they appear as direct providers or as coordinators of the activities of a number of local governments, in efforts to deal with issues that need an area- or

county-wide solution. In spite of the constantly changing image of counties, they have always been and are destined to continue as the cornerstone of local government in most states.

Court Administrators as Managers and Executives

Steven W. Hays

Department of Government and International Studies, University of South Carolina, Columbia, South Carolina, U.S.A.

INTRODUCTION

Professional court administrators emerged relatively recently within the field of Public Administration. Court systems, which had always been managed primarily by judges and elected court clerks, had been slow to modernize until the introduction of these specially trained managers. Their roles are diverse, but their essential responsibility is to improve the operation of courts by freeing judges from non-judicial duties and providing them with competent managerial infrastructures. Known by a variety of titles—such as court executive assistant, court executive officer, and judicial executive—court administrators are now common fixtures in many sizeable judicial systems in federal, state, and local government. However, they are not a universally accepted innovation in some locales. Serving at the pleasure of the presiding judge of their court systems, their duties also vary as dramatically as one might imagine within such a diverse mosaic as the American justice system.^[1]

A BRIEF HISTORY OF THE PROFESSION

The development of the court administrator profession has been sporadic. Its origins can be traced to several catalysts. Most notable were the court reform movement promoted by Dean Roscoe Pound of the Harvard Law School, “good government” efforts that fostered professionalism among city managers and other civil servants, and the “crisis in the courts” that occurred during the 1960s and 1970s.^[2] Court delay, backlog, and notoriously inefficient operating practices led such groups as the American Bar Association (ABA), the American Judicature Society (AJS), and various collections of judges (including the Federal Judicial Council led by Chief Justice Warren Burger) to demand improvements in the administrative capacity of courts. Spurred by federal funding—most notably the Law Enforcement Assistance Program (LEAP)—professional court managers were hired at a feverish pace during the 1960s and 1970s. A complementary trend in this regard was the creation of specialized training programs designed to prepare individuals for the unique challenges of managing judicial

bureaucracies. The Institute for Court Management in Denver, Colorado, was the first program focused exclusively on honing the skills of court managers. This joint effort of the ABA and AJS was soon joined by several academic degree programs, most notably, those at the University of Southern California and at American University in Washington, D.C. By the turn of the twenty-first century, the court administrator profession had achieved a respectable degree of status inside and outside of courthouses across the nation. Every state now has a centralized Court Administrator’s Office (usually as an appendage of the Supreme Court), and most urban trial courts and judicial circuits employ at least one professional court administrator and an appropriate support staff.

A MANAGEMENT PROFILE

Not only are judicial systems extremely diverse, but they are also some of the most tradition-bound institutions of government. These facts are reflected in the heterogeneity that prevails among workers who carry the title of court administrator. Most surveys reveal that court managers at the federal and state levels are attorneys, whereas lower courts more commonly employ individuals with more eclectic backgrounds. There is a strong tendency for judges to appoint people to these positions who have prior experience in quasi-legal organizations such as parole offices, law enforcement agencies, and court clerks’ offices.^[3] Moreover, many of today’s “court administrators” are court clerks; the traditional role of court clerk, which usually involved housekeeping functions and jury management, has been expanded to include a wider array of responsibilities. Although many of these clerks are elected and therefore not known for their preentry professional qualifications, considerable numbers now enroll in training institutes and other programs intended to refine their managerial skills. About one quarter of all court administrators are actually the jurisdictions’ court clerks (either elected or appointed), while most of the remaining group come from diverse occupational backgrounds. Notably, more than 70% of all court managers possess a college degree or better, suggesting that the field is becoming more professional

over time.^[1] However, there are still many court administrators (about 20%) whose formal education ended with a high school diploma. The ABA strongly endorses an elevation in the educational and professional standards for court administrators,^[4] and progress is clearly being made (albeit slowly in many locations).

Organizational Considerations

Court administrators' professional lives are significantly affected by the judicial context in which they work. Courts are hierarchical organizations, just like any other public institution. This hierarchy will usually be mirrored in the court administrators' duties. Those employed by the highest court in a state (usually called the Supreme Court) typically serve at the pleasure of the Chief Justice. As "at will" employees, their job descriptions and job security will fluctuate depending upon the whims of their boss. Some are therefore integrated into high-level policy-making decisions concerning such topics as judicial assignments and budget priorities, while others may be relegated to relatively insignificant tasks such as data collection. If the Supreme Court exercises administrative responsibility over the lower courts in the state (a typical arrangement), then the state-level court administrator may have some supervisory authority over counterparts in lower courts (circuit, county, or specialized bodies such as Family Courts). Stated more directly, centrally mandated procedures and other requirements might be monitored and enforced through the state's highest court administrator. That individual usually has a support staff of professional and quasi-professional employees, including clerks, statisticians, information management experts, budgeting specialists, and the like.

As one descends the judicial hierarchy, the court administrator's role continues to be controlled (in part or completely) by the chief administrative judge of the court in which the administrator is employed. The simple fact is that court administrators always have "a boss," and that boss is a judge or a group of judges acting collectively. In the latter case, a judicial council may take responsibility for management of the judicial system, and thereby appoints the court administrator much like city councils appoint city managers. And, logically, the size and jurisdiction of the court system will directly influence the administrator's job responsibilities. Trial courts will often make jury management a central task of the court administrator, while housekeeping functions (courthouse maintenance and security) will be part of the job only when those obligations are not already assigned to someone else (e.g., an elected court clerk, a sheriff, or other local official). In sum, it is almost impossible to

generalize about the specific duties and responsibilities of court administrators. There is no accepted template or approved job description; each position differs, and each is subject to dramatic change whenever there is turnover among the judges directly responsible for court management assignments.

JOB DUTIES AND RESPONSIBILITIES

As noted, the essential function of court administrators is to relieve judges of as many of their administrative burdens as possible so that they can focus on their chief obligation: hearing and deciding cases. Another implicit expectation is that the presence of a full-time manager within the court will increase the likelihood that administrative problems will be confronted head-on, and that modernization and innovation are more likely to occur. Judges are not generally regarded as being managerial gurus, so the introduction of professional managers is expected by many experts to be an essential step in improving court operations.

Consistent with these expectations, surveys of court administrators indicate that most of their efforts are focused on providing judges with a support infrastructure that handles most of the administrative minutiae, and upgrading management practices within the courthouse. The most common duties of court administrators are in the areas of personnel and financial management. They hire, fire, and supervise most of the non-judicial staff (court reporters, deputy clerks) and are responsible for preparing and monitoring the judicial budget. While these tasks may not appear to be challenging at first glance, the reality is much different. Summoning, selecting, feeding, and paying jurors can be a huge undertaking, even in a fairly small jurisdiction. Record keeping, meanwhile, is a highly specialized and labor-intensive responsibility that requires constant attention. The number of subordinate employees necessary to manage a typical courthouse usually exceeds 75, all of whom must be hired, trained, supervised, paid, evaluated, and disciplined. Riding herd on such a labor force is a major undertaking, and one that judges (and sometimes court clerks) are more than happy to offload.

Categories of Duties

David Saari and his colleagues^[1] organize the duties of court administrators around three management functions: "Operations," "Fiscal Services," and "Special Support Services." Operations include case management, calendaring, courtroom support, research, and program development. Of these, research and program development are activities that rarely, if ever, occurred

before the arrival of court administrators. Overworked judges simply did not have the time to devote to research and planning functions, so professional managers have clearly been a major asset in this regard. Under the fiscal services category, the court administrators not only assume most of the tedious burdens associated with drafting and monitoring budgets, but they also might bring new skills to the table. In particular, professionally trained managers are better able to generate new revenue sources through grant writing efforts, and they can also provide audit and accounting services that were beyond the capacity of most judges.

The "special support" category has perhaps been the area in which court managers have made their biggest contribution to judicial administration. In addition to functions that have already been mentioned, such as jury management, court administrators increasingly offer assistance in emerging "problem areas" within courts. One prime example is in the provision of language interpreters during trials. The recent influx of immigrants spurred by the collapse of the Soviet Union and related international developments has led to an incredible upsurge in trials involving non-English speakers. Sacramento County's (CA) court system, as one simple example, must provide interpreters for 91 different nationalities (including Russian, Chinese, Vietnamese, Greek, and Bulgarian). Other more recent areas of responsibility include courtroom security (this was almost a non-issue prior to the 1970s, when some judges were physically attacked by defendants) and pretrial services (such as intervention programs that permit first-time defendants to expunge their records through community service).

Of special note is the contributions that court administrators are making in the areas of information management and the introduction of new technologies. Prior to the modernization movement, courts were notorious for retaining handwritten docket books and otherwise ignoring the technological revolution that was occurring as a result of the computer age. Computerizing legal records, jury management functions, payroll, judicial calendars, and other courthouse operations has been a major preoccupation of many first- and second-generation court administrators. By upgrading the internal capacity of courts to manage their caseloads efficiently, some commentators have credited court administrators with much of the credit for reducing court delay and eliminating backlogs that once prevailed throughout the United States.^[5]

JUDGES AS THE CRITICAL FACTOR IN JOB EFFECTIVENESS

For obvious reasons, much of the court management literature focuses on the relationship between judges and their court administrators. Ultimately, the courthouse is a highly constrained environment for a professional manager. Judges are unquestionably the key figures within courts, and their level of receptivity to court administrators spells success or failure. Unless they respect the role that a professional manager might play in enhancing judicial operations, the court administrator's job can be terribly lonely and frustrating. Conversely, visionary and progressive judges can fundamentally improve their organizations' functioning by making maximum use of the managerial skills that many of today's professionals possess. But, because many judges neither understand nor trust the concept of court administrators, much additional groundwork needs to be laid before the profession achieves its true potential. A model that is espoused by many proponents is that judges and administrators govern the courthouse as a collaborative "team," yet this approach has seldom (if ever) been realized. For this reason, most court administrators continue to function as part of the judicial system's support infrastructure, but few exercise the discretion or policy-making influence associated with comparable positions in Public Administration (e.g., city managers or agency directors). This reality does not diminish the contributions that court administrators have already made, and continue to make, in modernizing judicial operations.

Court Budgeting: Judicial Branch Independence and Accountability

John K. Hudzik

*Global Engagement and Strategic Projects, Michigan State University,
East Lansing, Michigan, U.S.A.*

INTRODUCTION

Courts are large, complex organizations.^a With growth in workloads and programs, judicial branch costs have increased steadily (e.g., total state and local judicial and legal expenditures increased almost fourfold between 1984 and 2000).^[1] The emergence of performance standards [e.g., the American Bar Association (ABA) trial court standards] and legislative performance expectations lead to increased scrutiny of the resource planning and management practices of courts.^[2] Pressure throughout the public sector to cut costs requires greater attention to efficiency in the judicial branch through improved practices. Perceived declines in public confidence and satisfaction with the courts require that more attention is given to customer services in resource allocation decisions.

The growth in trial court costs places stress on local government's ability to pay. The movement toward state financing of trial courts and away from traditional forms of local financing is one consequence. Generally, larger judicial branch budgets, especially when aggregated into a single appropriation under state financing, draw greater political and public attention to how much the judicial branch costs and hence to how well it is managed. Critiques of judicial branch organization and performance have resulted in legislated reforms in the interest of greater efficiency and effectiveness. In several states, the adoption of state financing was tied to court reorganization and consolidation, performance standards, and greater controls over judicial branch allocation and expenditure decisions. Even where local financing remained the norm, increased costs brought increased supervision of expenditures by local commissioners and executives. In many jurisdictions, courts are treated as another agency of the executive branch, in direct competition with them for scarce resources, and subject to the same kinds of budget planning requirements

and controls. These changes are particularly salient for U.S. trial courts.

BUDGETS AND JUDICIAL BRANCH INDEPENDENCE

The separation of powers among coequal and independent branches of government has its blessings and challenges. Unproductive budget relationships between the judicial branch and the legislative and executive branches not only lead to insufficient funding for the courts but also attempts at micro-management by the legislative and executive branches on how courts and the judicial branch allocate and reallocate their funds. As the programs and costs of courts expand, their budgets and practices become more noticeable to those on the outside. Poorly managed courts and those which are inattentive to performance expectations invite attention from the outside and increase the likelihood of intervention. The power of the purse, lodged principally in the legislative branch, and the power of administration, lodged mainly in the executive branch, can be used to restrict the judicial branch's allocation of funds necessary to meet its objectives of impartiality, fairness, equity, and due process. Preserving judicial branch independence requires sufficient funding and freedom to allocate funds, but these two conditions are dependent on the three branches collaborating and being jointly responsible. Responsibility requires attention, on the one hand, to good stewardship of funds and attention to performance by the judicial branch; and, on the other hand, it requires good faith practice on the part of the other branches in support of judicial branch prerogatives to determine how best it can meet its constitutional responsibilities.

HISTORICAL CONTEXT FOR JUDICIAL BRANCH BUDGETING AND FINANCIAL MANAGEMENT

Court reform, court unification, and unified court budgeting provide a context for understanding

^aPortions of this article explore similar issues, although from a somewhat different perspective, to those in an article by the author in the 2002 ABA's volume on the administration of justice.

contemporary practice and debate over judicial branch budgeting and financial management. These terms originated in the court reform movement of the first half of the twentieth century; however, their impact has affected the reform efforts since the 1980s as well. Early reforms mainly sought to reduce variance in the number and types of trial courts and in local rules and procedures, and also sought to impose minimum standards of conduct and practice. The principal outcome was to create “one court of justice” in each state.

Besides unification and simplification, the three other components of early reforms included centralized rule making, centralized management, and centralized budgeting.^[3] The Supreme Court imposed rules to be adhered to statewide, and offices of state court administrators were established to increase centralized monitoring and control. In theory, centralized budgeting offered the ultimate means for unification because state-level preparation of the judicial branch budget would permit control over resource allocations at all levels and greater accountability to statewide standards.^[4]

Centralized budgeting requires state financing to be meaningful, and many see unification as being incomplete without state financing. Although all states moved to establish one court of justice, principally through rule making and some features of central monitoring, few adopted state financing. Using 1979 data, one study reported that only 8 states’ trial court systems were entirely or nearly entirely funded by the state; another 14 states had mixed state/local funding, with the state supplying more than half of that funding; and 28 states had mainly locally funded trial courts.^[5] Since 1985, more states have moved toward state financing, most notably California in the mid-1990s, and Florida by 2004. However, a mixture of state and local funding remains the norm in most states, and somewhat less than one-half the states’ trial court systems mostly remain locally funded. This shows that states are slowly taking on a greater share of court and judicial branch costs. For example, in 1984, states funded on average about 40% of total state and local costs for judicial and legal operations; by 2000 the proportion had grown to about 46% and with other changes since such as that in Florida, the proportion may now be approaching 50%. Greater state assumption is not always under the guise of adoption of state funding. Many times the creep toward greater state funding is programmatically focused such as was the case in Georgia when the state assumed in the early 2000s the responsibility for indigent defense costs.

State financing does not require highly centralized allocation and expenditure control from the state capitol. It is possible (and some would say preferable) to have relatively decentralized management control systems while using state financing. This was,

for example, part of the plan in the mid-1990s as California moved from mainly local to state support of trial courts. Florida may have ended up in 2004 with more of a balance between centralized control and decentralized management to the trial court level.

By the 1970s, court reform acquired a new emphasis that was less oriented toward reducing variance because, for the most part, one court of justice had been achieved in the states. The new goals were increased efficiency and effectiveness through continuing consolidation and centralization. In 1967, the President’s Commission on Law Enforcement and the Administration of Justice awakened reform interest throughout the criminal justice system and touted rational planning, consolidation, and coordination as means for dealing with the inequities and inefficiencies spawned by a political system that devolved too much to local control.^[6] The justice system, it was argued, was fragmented and in the absence of coordination it was inefficient and ineffective.

The press, for greater efficiency and effectiveness throughout government, was reinforced by the tax-cutting fever of the 1980s and 1990s, and by economic downturns in the early 1980s, early 1990s, and again 2002 through 2004. Improved court organization and management practices were directed toward reducing costs and improving services. The movement toward state financing was seen not only as a means to force additional reforms, but also as a way to shift the cost burden from local jurisdictions, which were increasingly unable to pay (for new staff, new programs, and for “black hole” areas of expenditure, such as indigent defense). Reducing budget inequities across trial courts and circuits that arise from largely locally financed systems also took on far greater importance from 1980 onwards. State financing and state-level allocation decisions in the interest of reducing funding inequities has become one of the strongest arguments for state funding.

EXPENSIVE AND DIVERSE JUDICIAL BRANCH OPERATIONS

Judicial branch costs have become a significant public expense, even though they constitute from 1% to 4% of total state expenditures (depending on what is counted and the proportion of total funding that comes from the state). State and local trial court expenditures nationwide are in the range of \$15 billion to \$18 billion annually; state appellate court expenditures (intermediate and supreme) add to the total. There are over 26,000 trial and appellate judicial positions nationwide and over one-quarter of a million other key court personnel.^[7] Large limited-jurisdiction urban trial courts spend well over \$100 million annually and, even among

the smaller courts, expenditures of several million dollars per year is not unusual.

Growth in cost has been driven partly by inflationary factors, but there are other important causes. The types of programs and services offered by trial courts have broadened considerably. Multiple formats of alternative dispute resolution, pretrial diversion programs, multiple types of pre- and post-trial services, help centers for unrepresented litigants, victim-witness assistance programs, a range of post-adjudication programming, and more customer-oriented services are common in courts today (and were not even 20 yr ago). Specialty courts are also much more common (e.g., mental health courts, drug courts, problem-solving courts, benches specializing in complex litigation). Growth in complex litigation such as toxic torts or class action product suits has increased the unit cost of trials on the civil side. Since the 1960s, annual caseloads have grown dramatically, and since 1988, caseloads have grown annually at an average of 5% per year. There are now nearly 1 million felony convictions per year in state courts.^[8]

INTERBRANCH RELATIONS AND CHALLENGES TO JUDICIAL BRANCH INDEPENDENCE

Increased costs have led to interbranch funding disputes. At both local and state levels, legislative and executive branches desire to manage judicial branch line items, and program allocations have strengthened, and in some cases threaten judicial branch independence. In addition, because most states have a mixed model of state and local funding for trials courts (including most of those states that are largely either state funded or locally funded), achieving coherency in the funding plan is challenged by inconsistencies between local and state priorities. Unitary budgeting is thereby challenged. Shifting or unclear agreements about which level of government pays for what (e.g., for court security, indigent defense, certain kinds of local programs, or shared use of local infrastructure, such as the County Clerks Office) can lead to “playing off” funding behaviors between levels of government.

Courts are sometimes caught between levels of government that argue over which gets to use court-generated fee and fine revenue. This revenue, generated by limited jurisdiction courts, typically produces surplus over cost, whereas the costs of general jurisdiction courts are rarely if ever covered. In the aggregate, trial courts produce insufficient revenue to meet costs; thus, pressure mounts on them to improve collection rates, tempting legislatures and executives to increase fee and fine rates. Increasing fee and fine rates, and asking courts to diversify their revenue streams (or spread costs to others) raises concerns about whether courts

can be entrepreneurial and do justice at the same time. Certainly, raising fees can limit access; and raising fines doesn’t mean they will necessarily be collected, perhaps leading to other sanctions as a consequence.

Stormy interbranch relationships over funding led to a spate of court-ordered funding actions during the 1970s, 1980s, and 1990s. Local funding authorities were angered. Bad press, challenges to public confidence in the courts, and concerns that judges were becoming too closely involved in local politics resulted. In some states, funding disputes between trial courts and local authorities reached sufficient heat and frequency that the Supreme Court and state court administrative offices imposed mediation and cooling off periods, and required Supreme Court or state court administrator’s approval before a local court order for funding could be enforced.

It was hoped that state financing would remove funding disputes from the local political thicket, and it usually did. However, in some states, it merely moved disputes to the state level. In some states, unpopular court decisions (e.g., the Supreme Courts striking down legislation as unconstitutional or otherwise flawed) led to retribution by legislative or executive branches in the form of “short” appropriations, or refusal to fund certain programs or new judicial positions. Severe budget shortfalls between 2002 and 2004 led many courts to adopt unpopular practices such as closing the court one or more days per week. These problems surfaced in both local and state-funded systems. State financing also did not necessarily solve the problem of unfunded mandates from the state legislature or from ballot initiatives (e.g., few, if any new funds followed to offset the impact of “three-strikes” legislation, which increased the number and cost of trials).

Interbranch funding disputes attracted sufficient national concern during the 1980s and early 1990s that the State Justice Institute funded a national conference in 1995 on funding the courts. The conference was cosponsored by the National Conference of Chief Justices, the ABA, and the National Conference of State Legislatures. During a conference plenary session, the problem was defined as a basic dissonance between the underlying assumptions of branches. The judicial branch asserted that it had the constitutional responsibility to define funding levels adequate to discharging its responsibility, and the legislative branch asserted its constitutional power of the purse. As a result, separate and coequal branches of government seemed inherently adversarial.

An alternative set of behaviors and assumptions was offered as a means to restore interbranch harmony. The legislative and executive branches, it was suggested, should 1) appropriate a lump sum to the judicial branch; 2) allow the judicial branch to set

priorities in allocating the lump to branch-set priorities; 3) permit the judicial branch authority to reallocate funds during the year; 4) permit the carryover of unspent funds across fiscal years as an incentive for implementing efficiencies; and 5) consult the judicial branch about effects on workload and attendant costs from proposed legislation. The quid pro quo was that the judicial branch should 1) become more managerially proactive in controlling costs; 2) improve or change practices in the interest of greater efficiency and effectiveness (e.g., by enforcing a firm continuance policy); 3) promulgate and be held accountable to performance standards; and 4) review priorities, discard non-performing programs, and reallocate resources to more important needs. Although not directly addressing whether the size of the “lump” might be sufficient in the first place, the quid pro quo sought a balance between power of the purse and judicial independence and sought to re-establish a functioning relationship between coequal branches.

Regardless of whether courts are locally or state funded, severe budget shortfalls impact them negatively as was the case from roughly 2002 to 2004. Budget shortfalls and reductions were serious enough that most states in a study conducted by the National Center for State Courts reported serious judicial branch budget reduction measures (e.g., of responding states 86% imposed hiring freezes, over half laid off temporary employees, nearly a quarter laid off permanent employees, a third delayed scheduled salary increases, all scaled back purchases, and 55% increased fee and fine rates). Courts are not isolated from budget reductions in time of budget or economic downturn. However, the lessons from the 2002–2004 period also support the view that compared to other agencies of government, courts tend to be held more harmless than most others. Courts are not immune, but do appear to have a somewhat favored status in lean times.

Interbranch relations remain problematic. Some state legislatures have become more engrossed in reviewing judicial branch line items, and some executives have begun to treat the judicial branch as another agency of executive branch in terms of budget submission and review. In a little over one-third of the states, the judicial branches’ budgets are submitted directly to the executive branch and its review lenses; in a little less than one-half the states, they are submitted directly to the legislature (and to both simultaneously in the remainder). In states where the judicial branch retains a fair degree of budgetary discretion and avoids the worst forms of interbranch warfare, politically astute and administratively skilled state court administrators and chief justices have been essential to forging positive and regular working relationships with key legislative and executive leaders. Similar skills of presiding judges and trial court

administrators are equally essential in locally funded systems. Perceived managerial competence^b and leadership has also risen in importance; courts perceived to be well run and that meet performance expectations appear to have a better environment for negotiating budgets and are given greater latitude to manage their affairs.

PROFESSIONALIZING THE MANAGEMENT OF COURT RESOURCES

In the early 1970s, the National Advisory Commission on Criminal Justice Standards and Goals, followed by the ABA, underscored the importance of professional administrators to improving the performance of the criminal justice system, including the courts. With the blessing and active involvement of Chief Justice Warren Burger, the Institute for Court Management (ICM) was formed in the early 1970s, with the mission of creating a professional cadre of court administrators for U.S. trial courts. Phase I of ICM’s core curriculum consisted of five topical areas, including budgeting. All graduates of ICM had to successfully complete the budgeting segment (along with the others). This requirement was the conscious recognition that competent budgeting and financial management skills were increasingly essential in court administration.

In 1998, the National Association for Court Management published the results of its 3-yr national study to identify the “core competencies” of court managers. Ten competencies were identified and “Resource Allocation, Acquisition, Budget, and Finance” was one among them. The study and subsequently published curricular guidelines concluded the following:

The allocation, acquisition, and management of the court’s budget affect every court operation, and arguably, determine how well, even whether, courts achieve their mission in the American political system. Allocating, acquiring, and managing financial resources is a core court management competency carried about by court managers, both judicial and administrative, and other court staff.... Effective court performance requires that court leaders—the executive team—have the ability: to set priorities and to manage competing demands on existing court resources in ways that build credibility, both internally and externally; to link resource requests to fundamental court purposes; to state court needs and objectives clearly and compellingly; and to protect judicial independence and

^bFor twenty years, the author has informally surveyed presiding judge and court administrator attendees at executive management programs. They have been asked to identify the factors most important to favorable relations with funding authorities. In the 12–15 factors usually identified, managerial reputation of the leadership team is typically ranked within the top two or three factors.

essential court functions while constructively negotiating with elected and appointed executive leaders and their staff.^[9]

This quotation is striking for many reasons, but for two in particular. First, there is implicit recognition of just how important and complicated budgeting and financial management have become in the modern court system. Second, there is reinforcement of the points made during the 1995 interbranch conference about the need for constructive behaviors between the judicial and the other branches of government.

The complexity of interbranch negotiations is the new reality. It is reflected in presiding judge rules in many states that assign presiding judges formal responsibility for the sound financial management of their courts. Although the addition of professional court administrators has helped, the sometimes complicated relationship between presiding judges and their court administrators confounds attempts at sound financial management and good interbranch relationships. Most judges, including presiding judges, have not had much management experience or much if any training in management practice. In addition, it is not unusual for presiding judges to change by election or rotation every 2 yr or so. Frequent changes in leadership make consistency in budget decision making, priority setting, stability in multiyear allocation plans, and the building of stable interbranch relationships problematic. The frequent turnover in presiding judges underscores the need for continuous training opportunities in budgeting and financial management.^c

The fact that professional budgeting practice in courts impacts judicial branch performance, accountability, and independence was underscored when the ABA's *Judges' Journal* issued a special edition in the summer of 2004 devoted entirely to the topic of, "Justice in Jeopardy: The State Court Funding Crisis."^[11] This was the first such publication devoted entirely to court budgeting. In part the special edition was in reaction to the serious budget shortfalls of 2002–2004, but also it reflected a "coming of age" of the centrality of budget management to judicial branch independence and accountability. Seventeen authors (academics included, but mainly judges, court administrators, and judicial officers) were united while making their individual contributions to underscoring

the importance of improved judicial branch administration of justice through more effective budget practice.

SHIFTS IN THE MIX OF LOCAL/STATE FUNDING

The movement toward state financing of trial courts has been underway for a number of years. By the late 1990s, nearly one-half of the states had wholly or substantially state-financed trial court systems and one-third of the states had substantially locally funded systems. The remainder were mixed with heavy components of both state and local support. Few states have full state financing (e.g., local jurisdictions almost always pay for facilities, and most locally funded systems still have state support for judges' salaries). However, the movement overall is toward greater portions of trial court budgets being supported through state appropriations.

The rhetoric for and against state financing involves numerous claims. The arguments in favor include greater equity in funding across trial courts, greater efficiency through scale, improved management quality, and more funds overall because of access to state coffers. Opponents assail proponents' claims as unsupported and predict that there will be loss of local control, more red tape, greater volatility in appropriations, simplistic formula funding, and a stifling of innovation.

Few if any of the claims on either side have been systematically researched, although there is strong anecdotal evidence that courts from the poorest jurisdictions are helped by state financing, that state financing makes it easier to temporarily shift judicial resources in a state, and that certain economies of scale are possible for programming that crosses trial court or jurisdictional boundaries (e.g., data systems).

OTHER REVENUE

As general fund appropriations fail to keep pace with perceived needs, the search for alternative sources of revenue intensifies. Fees and fines are substantial sources of court-generated revenue for both state and local jurisdictions (and for some states trial courts directly). However, fees and fines as a direct source of budget support for court operation are inherently problematic. If courts are expected to fund their own costs through fees and fines (or perhaps even produce surplus), it is not hard to imagine how justice and entrepreneurial motives could clash. Fees set too high limit access to the judicial system, and fines levied against the poor and indigent suffer from low collection rates if no consideration is given to the ability to pay. Fine revenue is a function of both the amount of the fine and its collectability. In addition, numerous states have already raised fee schedules over the last

^cFor an introduction to trial court budgeting, see Ref.^[10]. Also, the relationship between sound financial management skills and other managerial and leadership skills was underscored by the NACM study mentioned in Ref.^[9]. In that study, sound financial management was linked to relating resources to fundamental court purposes, to clear communication of purposes, and to an understanding of budget planning formats, problem solving skills, performance measurement, audit and request justification.

several years (especially during the 2002–2004 period), calling into question the “market’s” ability to absorb greater increases.

Numerous states, when moving from local to state financing, experienced difficulties accurately predicting how much of the cost of state assumption would be offset by redirecting fee and fine revenue from the local to the state level. Part of the problem was local government resistance to losing the fee and fine revenue, even though the local jurisdiction would no longer have to fund trial courts. Compromises were sometimes reached, which left a portion of the fee and fine revenue at the local level. Another problem is that the costs of state assumption have been underestimated significantly in several states. This, coupled to shortfalls in fee and fine revenue yield continuing controversy between the judicial and other branches of government.

Grants, principally from federal sources, such as the Office for Juvenile Justice and Delinquency Prevention or from various other programs within the U.S. Department of Justice, and from similar kinds of state programs are used by courts to fund innovation, special programs, or services and to provide enhancements not supported by general fund appropriations. However, grants rarely if ever provide ongoing funding, and pressure is put on court administrators to find replacement dollars for successful programs, either from other external sources or through internal reallocation. Federal reimbursement programs such as those for IV-D child support enforcement can return revenue for meeting federal objectives. Federal anticrime legislation adds potentially renewable revenue for targeted purposes (e.g., drug courts). On the plus side, grants provide the “risk capital” for trying new things, and also a funding bridge-period to finding permanent dollars, including through eventual reallocation of existing funds.

Other ideas for supplementing revenue include the use of volunteers, who if properly trained and assigned, supplement the personnel budget. Other ideas periodically surface such as “cut-of-the-action” schemes for the civil side of the docket where winners pay the courts a percentage of their “take” if they refuse mediation or others forms of dispute resolution, which are usually less costly than full-scale trials. In the ABA special edition of *The Judges’ Journal* referenced earlier, some authors identified other creative sources of funding such as, in exchange for depositing funds in a particular bank, the bank provides the court free or discounted financial services.

EMERGING ENVIRONMENTS FOR ACQUIRING RESOURCES

The reality of court funding is that a new relationship is evolving between the judicial branches and the

other branches, one that requires a quid pro quo, mutual responsibilities, and ongoing dialog across branch leadership on issues of court costs and financing. Regardless of promising alternative revenue sources, general fund appropriations, whether from state or local levels, will remain by far the largest source of money for funding judicial branch operations.

Courts will have to compete with other agencies of government for scarce resources. The *acquisition* of resources and the *allocation/management* of existing resources will increasingly be tied. Improved practice with the view of increasing both performance and efficiency can potentially yield resources for internal reallocation, as well as improve court management reputation with funding authorities.

Priority setting in resource requests helps to focus attention on the most important of needs, and a strategic approach to priority setting can help courts to focus requests rather than to diffuse or constantly change them. Frequent shifts in funding priorities send a message of unclear leadership. Multiyear budget planning will be required for many areas of new expenditure, such as for technology and other forms of organizational change, because the costs of these can only be met over several years. This would further suggest that courts increasingly will need to “stabilize” their strategic expenditure priorities, thinking through not only multiyear commitments to achieving long-range objectives, but also whether proposals involving new costs (e.g., new personnel) unintentionally commit the court to additional multiyear obligations. New multiyear obligations reduce allocation flexibility by tying up ever larger amounts of money. In addition, in times of fiscal constraint, funding authorities, although generally inclined not to incur new obligations of any kind, are particularly resistant to new multiyear rather than one-time obligations. One-time or 1- or 2-yr commitments are more palatable than permanent new allocations.

Interest in having line agencies self-fund or at least partially fund new initiatives is growing as a means for leveraging central resources (and vice versa). Self-funding or partnership funding requires courts to institutionalize organizational change as a means of freeing resources (e.g., by discarding low value-added programs or figuring out how to do the job differently and less expensively, such as, substituting court recorders for court reporters, or looking for partnerships with other public agencies or the private sector (e.g., in collections).

Forced efficiency reductions to court budgets by funding authorities is another reality with which court managers may have to contend. “Efficiency” reductions are a way for funding authorities to create policy reserves for reallocation, as well as a means to squeeze fat out of line agencies. In the process, the ongoing

budget is deliberately underfunded as a means to force organizational change (typically 1% to 3% in a given year). Agencies can usually absorb these over 1 or 2 yr, but over longer periods they are nearly bled to death unless fundamental change takes place either in the service mix or in how tasks are performed, or in how successful they are in attracting new funds from the policy reserve. Shorting budgets in the interest of creating policy reserves or in forcing efficiencies may or may not be openly announced, but are real nonetheless.

Change required to improve judicial branch efficiency and effectiveness will require a reshaping of programs and services that in some instances will require forming partnerships and effective cross-walks between the judicial and other branches of government, and between courts and other agencies of the criminal justice system. Joint commissions, interagency working groups, and standing interbranch staff analysis groups will be needed not only to review proposed legislation, but also to cooperate in meeting the costs of the many new kinds of programs that have become a more or less standard part of court programming.

CONCLUSION

Judicial branch acquisition of sufficient resources and the authority to allocate them are fundamental to meeting branch missions and purposes. The efficient and effective use of such resources is a responsibility and a core element of accountability. Responsibility and accountability are complicated by the nature of work in courts, by rising and more visible judicial-branch costs, by diverse expectations for branch performance, and by increased competition for scarce public resources. Court budgeting is not simply an issue of dollars and what dollars buy, but also of work performance and valued outcomes from the use of such resources. In the end, the judicial branch purposes of justice, equity, access and timeliness are served by a conjoining of resource acquisition and effective resource management.

Court System Strategic Planning

Deborah A. Botch

New York State Unified Court System, Albany, New York, U.S.A.

INTRODUCTION

The courts of the United States have experienced a quiet revolution over the past two decades. Once strictly neutral forums for case adjudication, courts have evolved into tribunals with a dual function. They remain the primary forum for resolving civil and criminal matters; but today courts also proactively seek ways to solve human and community problems. This fundamental change has brought with it new service demands and organizational challenges that have created a need for more systematic and integrative long-term planning. To confront this increasingly complex and dynamic environment, court systems have turned to long-established strategic planning tools and methods. This article explores concepts, models, and common practices adopted by federal, state, and local court systems in developing and implementing strategic plans.

PUBLIC SECTOR STRATEGIC PLANNING

By definition, strategic planning is a formalized and systematic process used by any organization, enterprise, or community to identify and achieve future goals through collective action. Long employed by large private sector corporations as a means of improving competitive advantage, strategic planning did not come into widespread public sector use until the 1990s.^[1] Faced with ever-increasing social and technological challenges, coupled with vocal demands for improved performance and accountability, government and non-profit organizations are now keeping pace with the private sector in instituting strategic planning processes as a matter of course. Today, strategic planning plays an important role in the management of many governments, government agencies, and non-profit organizations.

The public sector has adopted strategic planning as part of its organizational management structure for a number of reasons. According to Mintzberg,^[2] strategic planning processes serve multiple purposes. They are effective devices for self-assessment, improved communication, and consensus building. Bryson^[1] points also to strategic planning's utilization of participative

decision making, which is central to solving public problems in a democracy, as a key reason why the approach has been widely adopted and persists.

Legislative mandate provides another impetus to public sector adoption of strategic planning. Some governments have enacted laws and regulations that call for the submission of regularly updated strategic plans to executive and legislative authorities. A case in point is the Government Performance and Review Act (1993) that directs federal agencies to develop and submit strategic plans to Congress and the Office of Management and Budget (OMB).^[3] Strategic planning and routine submission of plans and performance reports to Congress and OMB are an ongoing part of the management processes of federal agencies.

The availability and proven track record of a number of strategic planning models have also contributed to the rapid expansion of public sector strategic planning. Bryson^[1] has developed a widely recognized and frequently referenced model for public sector strategic planning in the United States. Bryson's^[1] process consists of the following stages: initiate and agree on a strategic planning process; identify mandates; clarify mission and values; assess the organization's external and internal environments; identify strategic issues; formulate strategies to manage issues; review and adopt the strategic plan; establish a vision of success; develop an effective implementation process; and, reassess strategies and the strategic planning process.

COURT SYSTEM STRATEGIC PLANNING

Like its executive branch and local government counterparts, the judicial branch operates in an increasingly dynamic and uncertain environment. Increased case loads, public demands for greater accountability, and the introduction of grassroots problem-solving court programs are changing the environments in which courts operate. To respond to these changes, many courts have instituted strategic planning processes over the last decade and they continue to do so. The National Center for State Courts (NCSC) provides an extensive bibliography of court-related strategic planning materials as well as a comprehensive state-by-state reference list of court strategic plan documents.

The NCSC also supplies access to many electronic documents and links to sites containing court strategic plans and process information at their web site, <http://www.ncsconline.org/>.^[4]

Strategic Planning in Federal Courts

The federal judiciary has long operated under a formalized process of strategic long-term planning that reflects its unique Constitutional obligations. Administration of the federal courts, which includes long-range strategic planning among its various functions, is carried out under the policies and direction of the Judicial Conference of the United States. The Judicial Conference, made up of Senior Circuit and District Court Judges, directly oversees the Administrative Office of the Courts and authorizes and establishes standing and advisory committees that deal with specific areas of administration.^[5] In 1990, the Judicial Conference began a (<http://www.uscourts.gov/lrp/index>) long-range planning process with its establishment of the Committee on Long-Range Planning. The Committee's work reflected a highly decentralized and consultative process consistent with the federal judiciary's organizational structure and legally defined operations.

In meeting its charge, the Committee reviewed key historical plans and reports and coordinated its work with other committees of the Judicial Conference. These committees collaboratively prepared a number of subject-specific long-term plans, which included input from individual judges, supporting documentation from several judiciary sponsored research projects, and extensive public review and comment. Four years later, in 1994, the final product was a comprehensive draft long-range strategic plan containing dozens of long-term goals and implementation strategies.

In December 1995, the Judicial Conference of the United States adopted a final version of the *Long-Range Plan for the Federal Courts*, which contained a Vision and Mission Statement and 93 goals and 76 implementation strategies. A complete copy of the *Long-Range Plan for the Federal Courts* is available at the federal courts web site, <http://www.uscourt.us.gov/lrp>.^[6]

Strategic Planning in State and Local Court Systems

At the state and local level, while many different approaches have been applied to strategic planning development and implementation, most court systems have relied on only a few strategic planning methodologies and models to guide and coordinate the process. According to Martin and Wagenknecht-Ivey,^[7] these methods and models address organizational improvement issues and reflect an external and community

focus. They invite broad-based public participation and include stakeholders from outside the court to assure sustained community involvement. According to Rottman et al.,^[8] community collaboration in the court planning process inculcates greater understanding of the role of the courts and fosters public trust and confidence.

While the composition of planning committees varies, two distinct approaches are generally used in structuring court strategic planning committees. According to Martin and Wagenknecht-Ivey,^[7] the first approach is broad-based, made up of judges, court personnel, local government officials, lawyers, citizens, and community groups. In the second approach, the committee is entirely composed of judges, court staff, and court system administrators.

In the following section, two models that illustrate the key attributes, processes, and methods common to court strategic planning will be discussed:

1. Court Community Planning Model (Judicial Council of California).
2. Nine-Step Court Strategic Planning Process (Center for Public Policy Studies).

COURT STRATEGIC PLANNING MODELS

State of California Court Community Planning Program

The State of California Court Community Planning Program is an excellent example of the application of the community-focused model of court planning. In keeping with the model, the California program has been designed to promote community outreach and development of court–community partnerships.^[9]

The Judicial Council of California, the governance board for the State's judicial branch, is responsible for improving the administration of justice in California. The Council has adopted an official strategic planning process and management cycle that is integrated with other administrative processes, including annual judiciary budget preparation. In 1998, under the direction of the Judicial Council, the California courts launched its community-focused strategic planning process. The process fosters inclusion of community stakeholders as full partners in the planning process and relies on a five-stage community-outreach model developed in consultation with national experts.^[10] Much of the planning in this model is delegated to courts at the county level and is accomplished by teams of county court judges, court staff, local government officials, bar representatives, and community groups.

Several features of the five-stage model are common to other public sector strategic planning models. For

instance, there are similarities with strategic planning steps recommended in Bryson's^[1] framework, such as clarifying vision and mission, scanning the environment to determine important issues and trends, and development of goals and measures of success. But what sets the California model apart is its emphasis on broad-based public participation and the "enablement" of public involvement.

To enable community participation, the California model recommends creation of planning teams that include broad-based representation both from within and outside the courts. In the enablement phase, training is provided to all planning team members in the basics of strategic planning and use of the five-stage model as a means of building planning capacity and group cooperation and cohesion.

The California Courts Community Planning Model has generated a variety of local ideas for improving court operations and making courts more responsive to the unique needs of the State's socially and economically divergent communities. This planning process has also spawned a variety of community justice partnerships. For example, court- and school-based education programs have been instituted in a number of small rural jurisdictions to enhance student understanding of the legal system. Elsewhere, a citizen advisory board has been established to build court and community trust and cooperation in the Los Angeles Superior Court.^[8] The success of the collaborative

model used in California can also be seen in the rapid response and participation in the planning effort. As of 2002, all 58 counties of the State had submitted court community strategic plans to the State's Judicial Council.^[10]

Nine-Step Court Strategic Planning Process

By far, the most popular model used for court system strategic planning is that developed by John A. Martin and Brenda J. Wagenknecht-Ivey as consultants to the Center for Public Policy Studies (CPPS). According to Martin and Wagenknecht-Ivey, the *Nine-Step Court Strategic Planning Process* offers a standard systematic approach that can be readily adapted for use by any court system, court, or court subdivision. Although input from the wider community is a feature in the model, it is not a requirement. The nine-step model focuses on organizational change, learning, and improvement. As of the year 2000, more than 50 state and local courts and other justice agencies have reported adoption of this model for strategic planning (Fig. 1).^[7]

According to Martin and Wagenknecht-Ivey,^[7] because strategic planning requires significant resources and time commitments, courts need to be sure that conditions are right for introducing strategic planning. The authors recommend that, prior to undertaking

Fig. 1 A nine-step strategic planning process for courts. (From Ref.^[7])

strategic planning, court leaders must be able to focus on long-term priorities, be ready to embrace organizational change, and be willing to involve a wide-range of participants in planning. Wagenknecht-Ivey has developed a tool to score and evaluate an organization's conditions of readiness.^[7] If "readiness" criteria are met, court organizations are given the green light to move ahead with a strategic planning efforts.

Following the readiness assessment, the nine-step model begins with a commitment from court leaders and managers and an agreement from the planning group about the scope and purpose of the effort. Steps 2 and 3 focus on development of vision and mission statements. Step 4 consists of a trend analysis and scenario constructions. Scenario construction, according to the authors, can help planners picture how a variety of trends may impact on the courts and how courts can shape a positive future. They are creative tools that involve speculation and imagination, but are not predictions. Use of scenarios facilitate systematic future-oriented and "what if" thinking to help organizations better understand the potential forces impacting on desired future conditions.^[11]

Step 5 in this model is an organizational assessment that, according to the authors, allows the court to see how its structures, policies, attitudes, and resources align with "expected" and "desired" future conditions. In step 6, strategic issues and key-result areas are identified. Strategic issues are the critical policies or challenges to the court organization that will impact on future effectiveness. Step 7 involves development of comprehensive strategies to respond to each strategic issue area. The authors consider this step to be the heart of the model and recommend that broad goals, objectives, and end targets be established.

Step 8 moves plan formulation into operational and action planning stages and involves project selection, setting time frames, and evaluating resource availability and impacts.^[7] The model assumes that strategic planning will be an ongoing and continuous process. As a result, step 9 urges courts to set up methods for monitoring and evaluating results and developing plan updates.

Mentoring guidelines have been prepared as a practical tool to guide court strategic planners in using the nine-step model.^[7] The guidelines provide a case study of the Florida judicial branch long-range strategic planning effort. This case study illustrates the application of the nine-step model in an actual court system environment and shows how the model facilitates a court strategic planning process. The value of the nine-step strategic planning approach is confirmed not only by the Florida courts example, but by the number of other strategic plans it has helped foster. For example, see the plans of several statewide court systems—California, Michigan, and Wisconsin, and

at the trial court level—Los Angeles County Superior Court, 36th District Court in Detroit, Michigan; and, Yakima County Superior Court in Washington State.

Other Tools That Aid Court Strategic Planning

Along with models that are used to guide, coordinate, and quicken the pace of strategic planning, several other practical tools are available to facilitate the strategic planning process in state and local court systems. One such tool is a set of performance standards that have been adopted and used by hundreds of trial and municipal courts across the country to improve the quality and accountability of court programs and services.^[12] The Trial Court Performance Standards (TCPS),^[13] developed by the Commission on Trial Court Performance Standards, provides 22 guiding principles covering five public interest areas:

1. Access to justice.
2. Expedition and timeliness.
3. Equality, fairness, and integrity.
4. Independence and accountability.
5. Public trust and confidence.

To support vision and mission statement, development state and local courts often rely on these national performance standards as a key resource.

A second tool available to state and local court systems is one that can help shorten the time frame and reduce the cost, complexity, and work required of strategic planning. This tool is referred to as the "environmental scan" and is a concept presented in detail in the *Environmental Scan for State Courts 2002*, developed by the National Center for State Courts and Futures. com.^[14] As explained in the overview of the *Scan* report: "Environmental scanning attempts to identify events, trends, and developments or drivers, shaping the future . . ." Trends, for instance, can include those in social, scientific, technological, economic, political/governmental, and professional categories.^[14] In its broadest sense, environmental scanning involves an effort to take a court beyond its current ways of doing things (or encouraging it to rethink its "paradigms"). The scan report can be used by a court or court system to support strategic planning either as the sole resource for identifying forces and changes in the external environment or in combination with locally prepared environmental trends information and analyses.

A third tool that can be used as a foundation for strategic planning is the information gathered in court "futures" reports. As indicated by the National Center for State Courts web site, during the 1990s, 22 state court systems created futures commissions or committees. These study groups were generally initiated by

visionary state judicial leaders whose objectives were to assess economic, social, cultural, technological, and political trends and to consider how court systems should adapt their structures, rules, workforce, operations, and intergovernmental and community relationships to effectively respond to expected changes.

The Ohio Courts Future Commission undertook one such “futures” study. Conducted by a variety of legal experts, community and business leaders, and citizens, the Ohio study provides a good example of the breadth of issues and long-range horizons generally reflected in court futures studies. The Commission’s final report identified 10 key attributes of the Ohio courts that would be desirable by the year 2025, including, among other things, courts that are physically, economically, and functionally accessible to all citizens, a jury system that respects jurors and lets them take a more active role in court proceedings, selection of judges based on superior legal and personal qualifications (trained and continually reeducated on topics of relevance to the courts), and a workforce that is well trained and professional.^[15]

Strategic Planning Issues and Future Directions

Even with its benefits, such as clearer mission and goals, coherent decision making, and improved performance, strategic planning may not be suitable for some court organizations or in all circumstances. Bryson^[1] cites a number of difficulties and challenges that must be addressed to ensure success, including, foremost, the commitment of key leaders and stakeholders. Bryson further recommends that if implementation appears unlikely, strategic planning should not be considered. Martin and Wagenknecht-Ivey^[7] also recommend that courts assess their readiness for change and the commitment of leaders and stakeholders before embarking on a strategic planning effort. Critics of strategic planning are also concerned with the costs and time-consuming aspects of the process. Hamel,^[16] for example, argues that strategic planning is not only too costly but also does not provide for the fast-paced strategic development needed by today’s organizations.

Henry Mintzberg,^[2] in his classic work on the “rise and fall of strategic planning,” cites several other limitations of strategic planning including the conflict between the creativity necessary for innovation and the logical and systematic requirements of formal planning. For the public sector, he reiterates the challenge of ensuring that the desires of the people are adequately represented. Mintzberg^[2] does not entirely dismiss the process, but notes that while strategic planning may have benefits, at best, “[it is] a process with particular benefit in particular contexts” (p. 4). More recently, Raffoni^[17] argues that strategic planning often founders

at the execution stage because of a limited understanding by management of what it takes to successfully implement strategies. Raffoni also contends that few plans recognize the importance of translating broad-brush conceptual strategies into decisions about who will carry out the associated tasks and how much time and money will actually be expended.

In spite of these difficulties, the need for effective methods to deal with the dynamic forces of change remains a major challenge for court systems and other public sector institutions. Strategic planning and related techniques that facilitate communication, collaboration, goal setting, and accountability have helped many public sector organizations better prepare for the future. At the same time, there is recognition^[18] that more robust, focused, coordinated, and democratic methods will be needed if strategic planning is to remain a viable and beneficial tool for the next generation of public leaders, managers, and citizens.

CONCLUSION

Strategic planning concepts, tools, and models have helped many court systems prepare for the future and transform themselves into more responsive public organizations. As the pace of change quickens and public expectations for effective performance increases, systematic planning processes will become even more critical in ensuring the effectiveness of courts and court/community cooperation at all governmental levels. Recognizing this, several state court systems have made strategic planning an integral and ongoing organizational management process. Also, the National Center for State Courts continues to expand its resources and services to help court systems build and sustain their strategic planning capacity. While public sector conditions have dramatically changed in recent years, those courts that have a history of long-range, systematic, and broad-based strategic planning are likely to be able to adapt to changing conditions and meet new demands for service and effectiveness now and in the future.

Court Technology and Information Systems

Ronald M. Stout Jr.

4th Judicial District, New York State Judiciary, Latham, New York, U.S.A.

INTRODUCTION

A full discussion of the concepts, applications, promises, and realities of court technology and information systems would require, and indeed deserve, an extensive analysis and discussion far beyond the confines of the space possible in the *Encyclopedia* (for example, see Ref.^[1]). Instead, this article will identify court functions that can be enhanced by the application of technology, the types of application software that are available in which to develop these functions, equipment and connectivity options depending upon the size and scope of the functions, and courts, design, implementation and maintenance considerations, and cautions to be exercised.

Developing technology and information systems for courts is a highly appropriate activity, because receiving, processing, and disseminating information is the method by which courts achieve their objective. From the initial filing of a case to the final postdisposition action, litigants, the bar, judges and their staffs, and the public, are entirely dependant upon timely and accurate information about the status and the substance of the case. Courts have always had information systems. Manually maintained docket books, ledgers, index cards, and file folders, combined with handwritten documents and notices are information systems. Some courts to this day continue to process information in this manner, while many more have hybrid systems that combine manual and automated components.

ENHANCEMENT OF FUNCTIONS BY TECHNOLOGY AND INFORMATION SYSTEMS

Virtually every function required by a court can benefit from the application of technology and information systems. Perhaps the first function that comes to mind when considering court information systems is case-flow management. Case-flow management, dealt with more extensively elsewhere in the *Encyclopedia*, “involves the entire set of actions that a court takes to monitor and control the progress of cases, from initiation through trial or other initial disposition to the completion of all postdisposition court work,

to make sure that justice is done promptly.”^[2] A comprehensive case-flow management system should include the ability to:

- Record all incoming documents or actions that initiate and continue a case, including those that are filed electronically.
- Assign a case to a judge.
- Schedule all events and record the outcome of those events.
- Monitor compliance with interim and final deadlines, and produce appropriate warning notices.
- Produce scheduling and non-compliance documents (such as warrants).
- Record all fees and fines levied, collected, or delinquent, and produce appropriate documents.
- Record all individuals associated with the case, including litigants, attorneys, probation officers, and court-appointed representatives or fiduciaries, and produce appointment and termination notices.
- Allow ad hoc inquiries to determine the status of one or more cases, the schedules for any day or judge, and the cases with which one or more participants are involved.
- Produce all required statistics, including those describing case processing, judicial workload, and court assignments of attorneys and fiduciaries.

If automating case-flow management can be considered applying technology to the processing of cases, a second function that can be assisted by automation is the substance of a case. Applying automation to this function assists judges by, for example, producing substantive orders, calculating structured settlements in civil cases or child support payments based upon income and expenses, producing transcripts of judgments and criminal commitment orders. In addition, automated systems can permit electronic filing of initial and subsequent papers, answers, motions, depositions, fees, and proposed orders. The line between this function and the case-flow management function is not definitive—after all, a case-flow management function should produce warrants and commitment orders. However, automated systems can offer judges the option of selecting a wide variety of standard provisions and provide calculation power for complex financial proposals. Even orders that require extensive

tailored provisions can benefit from the automated capture of the names of the parties, the issues, and the attorneys.

A third function is computer-assisted legal research, permitting judges and staff to conduct rapid and comprehensive legal research from their offices or from the bench. Materials available on-line include:

- Federal, state and local statutes.
- Appellate and trial court decisions and opinions.
- Treatises on specific areas of law.
- Citation checking in a draft opinion or decision.

A fourth function that can benefit from the application of technology is case conferencing and presentation. This includes:

- Telephone and videoconferencing to conduct scheduling, settlement, and pretrial conferences.
- Videoconferencing for trial testimony.
- Video display units for presentation of evidence during trial, with images of evidence displayed on screens of opposing attorneys, court clerks, the judge, and jurors.

Establishing a record of court proceedings is another function in which technology can improve efficiency and effectiveness. Software is available that:

- Instantaneously transcribes court reporters' notes, which greatly facilitates read-backs and the production of transcripts.
- Where permitted by law, electronically records court proceedings using either audio or video.

Courtroom utilization in large facilities can also benefit from technology. The demand for courtroom space in large urban settings is frequently very high. When a case in a trial settles, a trial is suspended for a significant period of time, or a case goes to a jury, the use of telephones, e-mail and even radios can notify judges and court staff of the availability of a courtroom.

Technology and information systems can also be applied to records management with great effect. Microfilm is an excellent records preservation tool but generally not a good management tool. Imaging systems that capture documents directly or in concert with microfilming systems make documents available to judges, staff, and the public, under the appropriate controls.

Technology can improve jury operations by:

- Merging mailing lists from different sources to establish the widest possible pool of potential jurors.
- Printing qualification and summoning notices.

- Tracking the response to those notices and producing corrective documents.
- Monitoring juror utilization once in the courthouse.
- Recording attendance.
- Producing documents necessary to authorize payment to jurors.

Communication within and without the court is another function ripe for the application of technology and information systems. Effective communication is essential for any organization, but particularly for the courts. The multiplicity of players in the courts makes establishing and maintaining effective communications especially difficult. This includes judges, staff, the private bar, executive branch agencies at the local, state, and federal levels, and litigants.^[3] Each organization and individual may have vastly different communications capabilities, ranging from integrated information and technology systems to homes without a telephone.

Communication covers a broad area, including:

- Informing each other about events affecting the status of a case, such as motions, agreements, scheduled appearances, proposed and final orders, and settlements.
- Advising attorneys about court rules, forms, schedule of terms of court, and changes thereto.
- Providing the public with a description of the court system and the purposes and general processes of the different components of the court, hours of court, directions to the court, types of proceedings that can be brought and the forms to be used, and a directory of related agencies.

Automating administrative functions has long been practiced by the public and private sectors. Administrative functions that can be automated include:

- Preparing budgets, and submitting them to the appropriate legislative body.
- Establishing expenditure accounts based on appropriations, tracking encumbrances, expenditures, reporting balances, and providing projections.
- Issuing purchase orders, and preparing vouchers for payment.
- Maintaining inventories of accountable equipment.
- Maintaining lists of authorized position titles and their qualifications.
- Maintaining lists of positions authorized to be hired, production of vacancy reports, and turnover rates.
- Tracking employee information, including data on hiring, salary, promotions, disciplinary actions, fringe benefits, training, and separation.
- Issuing paychecks.

- Tracking the availability of judges and non-judicial staff for assignment throughout the appropriate jurisdiction.

Many of these functions may be performed in whole or in part by local or state governmental agencies. Nevertheless, a careful review of the court's needs is advisable to determine if supplemental systems would be useful.

TYPES OF APPLICATION SOFTWARE

There are many types of software in which applications can be developed to perform the functions needed by the courts. In addition, the types of software have increasingly been bundled into "suites" of software that easily interact with each other. Increasingly, also, each type of software has elements of other types of software built into their design.

Database software is highly useful for developing systems to augment most court functions. A proper and comprehensive database application will identify all entities (e.g., people, places, events) and have the capability of storing all required information about those entities (e.g., names and addresses of people, court appearance dates, purposes of appearances and their outcomes, courtroom numbers, appropriations, voucher amounts, and personnel titles).

Database software programs have the capability of retrieving and presenting information in printed reports, on video display terminals, or electronically to other systems inside or outside of the courts. Data can be retrieved on a periodic or ad hoc basis. It can be tailored for any number of purposes, from providing a complete case history for a judge, to confirming a court date to a member of the public, to providing the latest court decision on a topic of interest.

Once the data is entered, it can be used for a virtually endless stream of documents, reports, and displays. Routines can be written to periodically scan records for compliance with processing dates and produce exception reports, compile statistics, and compute balances.

Word-processing programs can be used alone or in concert with database programs to produce documents for every court function. Templates can be written for standard documents, and automated messages can be built in to prompt for specific information. Alternatively, data can be automatically transferred from database programs to populate standard information, and specific information can be added to the document. Word-processing programs also have the capability of storing names, addresses, and other information in a database-like format, which can then

be merged with a standard letter to produce mass mailings.

Spreadsheet programs are used primarily for manipulating numbers through mathematical formulas. Templates can be designed that are extremely useful for calculating the consequences of different proposed settlements or payments required for support payments. They can also be used for projecting expenditures under different assumptions. It is also interesting to note that relational database systems store data in tables that are, in effect, spreadsheets. Under carefully controlled design criteria, a spreadsheet can be used as a source of data in a database program, and vice versa. Finally, word-processing programs usually have a table feature, which also resembles a spreadsheet. Spreadsheets can be imported into word-processing programs as tables. This can be very useful, if, for example, a structured settlement worked out in a spreadsheet needed to be incorporated into a settlement order written in a word-processing program.

Electronic mail is an increasingly widespread communications tool capable of very quickly reaching one or more individuals or institutions. Information can be contained in the body of the message or in attached documents. In addition, most database, word-processing, and spreadsheet programs have the capability of attaching documents created by the software directly to an e-mail message.

Scanning and document retrieval software has the ability to capture images of documents filed with the court, including signatures and seals, and to retrieve those documents for printing or display on terminals. It is becoming increasingly common for database programs to be able to electronically link to document images, so that, for example, all papers that have been filed regarding a case can be retrieved while reviewing case-processing information contained in the database. In addition, scanned documents can be attached to e-mail messages.

Facsimile transmission software is available that will permit sending documents or reports that have been produced by database, word-processing, or spreadsheet software to recipients who have fax machines or computer-based fax software. In addition, scanned documents can be distributed using facsimile transmission software.

Word recognition software permits an individual to enter information into software applications by using a microphone rather than a keyboard. This software is useful for judges and staff to dictate information into a word-processing document, and for the public in responding to automated information sites.

Touch-screen software can greatly simplify accessing information from automated systems. It is typically applied to programs that present structured responses to a set of structured questions.

EQUIPMENT AND CONNECTIVITY OPTIONS

There is an ever-increasing variety of equipment available to the courts that can operate independently or be connected in a wide array of options. Manufacturers are constantly developing equipment that has increased capacity and speed, as well as new items. It is difficult to keep current with developments in this area. Consequently, this section of the article will endeavor to be as generic as possible.

Telephones, copiers, and fax machines have been part of the office and the court for so many years that we tend to overlook them as components of court technology. They should not be overlooked as vital components of court automation. As mentioned previously, telephone conferencing can be a vital part of case processing. Fax machines can be used in every aspect of communication involving case documents, including initiating cases, filing motions and supporting papers, scheduling orders and notices, and making interim and final orders. The use of copiers is obvious, and their utility can be greatly increased by placing them throughout the court facility. For example, placing a copying machine in a courtroom can increase productivity by providing instant copies of orders, documents in evidence, and other case-processing information.

The most immediately recognizable configuration of automation equipment is a desktop computer with an attached printer. Although relatively simple, desktops have become sufficiently powerful to run every type of application software performing every type of function listed above. To have e-mail, a modem would be necessary to connect to the internet. To be able to use document imaging, a scanner would be required. There are multipurpose devices that incorporate printing, faxing, scanning, and copying in one machine.

Laptop computers have the same basic capacities as desktop computers. Their advantage is that they are portable, capable of, for example, being carried from a judge's chambers into a courtroom. Their disadvantage is that they are more expensive and less powerful than desktop computers for the same price.

The next step in automated systems is the local area network (LAN). A LAN connects two or more computers and allows users to share data, application software, and devices such as printers, scanners, and modems. In addition, a LAN can have an internal e-mail system installed, as well as a system of equipment and software to establish an intranet for court judges and staff to have access to information and applications within their own environment. A LAN can also have a gateway to allow users to access the Internet without having individual modems for each computer.

A wide area network (WAN) is a LAN with users separated by distances further than can be reached

by signals generated by LAN equipment. Routers or switches that convert and send signals over telephone lines are required. The features of a WAN are essentially those of a LAN, but extended beyond the reach of a LAN.

Kiosks are capable of displaying information about the courts in general, court schedules, forms to use and print out, and receiving information from the public, including court filings, pleas, and payments of fees and fines. The information provided and functions performed by these devices can be updated and modified from direct manipulation of the application software on the kiosks or "remotely" from court staff using their computers connected to a LAN or WAN. Status boards or running displays, similar to those found in airports, can also provide information to the public, and their messages can be modified from local devices or LAN- or WAN-based computers.

E-mail systems can also feed pagers, cell phones, and personal digital assistants via wireless Internet connections or through other communications systems. It is no longer necessary to be physically connected to receive information about courts, the status of a case, or a change in schedules.

DESIGNING, IMPLEMENTING, AND MAINTAINING SYSTEMS

The most challenging aspect of applying technology and information systems to the courts is determining the needs of the courts and establishing the appropriate mix of functions, software applications, and equipment and connectivity options. The most critical step in designing a system is to obtain a project sponsor for developing or improving an information system. A project sponsor should be placed high enough within the organization to be recognized as having the necessary authority to cause sufficient resources to be devoted to the effort to enable it to succeed. The project sponsor will change radically depending upon the size of the court system and the size of the project. It could range from a chief justice of a supreme court in a statewide system, to a magistrate in a rural town overseeing a two-person staff.

Once the project sponsor has been established, the court must carefully examine its resources to determine if it can reasonably design, implement, and maintain an information system. Larger court systems may well have sufficient in-house staff to undertake such an effort, while others may need consultant services. Even the largest organizations may contract with outside firms to provide guidance, support, and technical advice. Consultant services may be available from local and state governmental agencies, national organizations such as the National Center for State Courts,

and the private sector. For smaller courts, the state court administrator's office can frequently provide services directly or offer guidance in selecting consultants and vendors.

An important step in starting a court automation project is to become familiar with and adhere to basic principles of project management. There are a number of different methodologies and tools available, ranging from relatively simple to highly developed. The scope of the project will help to suggest the level of project management sophistication required to bring a project in on time and within budget.^[4]

Another critical step in designing information systems is to define the scope of the project. A careful definition of what functions are to be automated in which courts or offices, with a budget and timetable, and adherence to the scope definition, will help increase the probability of success. The scope should be committed to writing and signed by the project sponsor and key staff involved with the project. Any change to the scope of the project should be expressly addressed, complete with the additional time and expense required to include the change in the scope. Special attention should be given to insure that only those changes necessary to the success of the project are approved. Many requested changes can be dealt with at a later time, as a separate project.

In many instances, the court may find that it is not possible to incorporate all functions or courts in a current project. It is important that statements of scope that incorporate less than a total design include the possibility of expansion to other functions or courts in the future.

It is important that the judges and staff define the scope. They are the business experts and know what court functions would benefit the most from automated systems. While internal information technology analysts or consultants may offer advice as to the structure of the scope statement, or the time and cost implications of elements of the scope statement, the project sponsor, judges, and staff should have control of the final statement of scope.

Systems designs can range from a simple single desktop computer running a word-processing program to automate repetitive documents, to completely integrated data, voice, and imaging systems incorporating virtually all court functions with thousands of users spread over thousands of miles. Regardless of the size of the system, as with the preparation of the scope of the project, judges and court staff must be involved with the design of the system. This may require a significant amount of time, depending upon the scope of the project. It will also require a joint effort with in-house and consultant technology staff. Court staff and technology staff must take the time to insure that the needs of the court are completely understood, while

the cost and maintenance implications are clear and unambiguous. The final design, backed up by test runs of software and hardware, should be reviewed and approved by the project sponsor. Finally, it is imperative that all aspects of the design be well documented. The documentation provides the basis for corrections, modifications, and support in the future.

Implementing a new or modified system requires careful planning and patience. The system may require physical modifications, new equipment, and furniture. A certain amount of disruption of ongoing operations is inevitable, so careful coordination of court schedules, vacation plans, and backup will minimize problems. Arrangements must be made for training and intensive support after installation. Finally, last minute adjustments to the system may be required as a result of using the system in actual operations.

The assets required to maintain the system once it is installed should be included in the design phase. The need to modify the system for new requirements and correct problems will always occur. Providing for adequate maintenance is imperative, if the court's investment and operations are to be protected. Maintenance services can be provided by in-house staff or through contracts. The utility of solid systems documentation will become readily apparent at this time. However, the systems documentation must be maintained and updated by the group maintaining the system, or future efforts will be severely hampered.

CAUTIONS

One of the overriding concerns in any automated system is security. This is particularly important in court system records. Statutes and case law establish strict security requirements. Every effort should be made to incorporate appropriate security measures in the scope and design phase of a project. Judges and staff should ensure that the technical staff understand security requirements, and that they are satisfied with the security measures being described to them.

A second cautionary note is not to simply automate existing manual systems. The design phase of an automated system is an excellent opportunity to carefully review systems and procedures to insure that they are required by law, rule, good management practices, and are not redundant. Automating a confusing and unnecessarily complex system will only perpetuate past problems.

A third concern is the potential of e-mail to exacerbate the problem of ex parte communications. E-mail is widely used and can be an efficient method of communications with participants in a court case. Because it is so easily used, caution must be exercised by all parties to ensure that the contents of an e-mail message

from a litigant or an attorney does not cross the line into discussing a proceeding before the court without the full knowledge of all parties.

CONCLUSION

Technology and information systems have great applicability to the processes and procedures used by the courts. Virtually every function of the courts can benefit from carefully designed automated systems. Application software is widely available to develop automated systems in the courts. The capacity of equipment and interconnectivity continues to grow.

A well-known observer of court systems noted, “The great unknown for court leaders is the ultimate effect of telecommunications and computer technology on the courts As information systems integrate all types of information and the court starts to become a self-aware, self-correcting system, there will be fundamental changes in time-honored court practices.”^[5]

In order to take advantage of the promise of technology and information systems, courts must devote the resources necessary to design systems. In addition, judges and staff must devote a significant proportion of their time to ensure that the systems meet the needs of the courts.

Technology and information systems present a great opportunity and a great challenge to the courts. To keep abreast of ever-increasing workloads and to respond to the public’s demand that the courts become more efficient, courts will have to meet the challenge and take advantage of the opportunity.

Court Unification

James A. Gazell

*School of Public Administration and Urban Studies, San Diego State University,
San Diego, California, U.S.A.*

INTRODUCTION

Court unification is the degree to which federal and state judicial systems in America have established a single level of trial and appellate courts administered from the top by one institution or individual. It is a facet of centralization in government—an application to one of its branches: the courts. It proceeds along a continuum from autonomous individual judges and court administrators at one end to close hierarchical supervision of both at the other end. Synonymous terms include court centralization, court modernization, court bureaucratization, and court reform. It was a structural and administrative concomitant to the development of the nation's court systems.

PRE-EMINENCE

Court unification has been the pre-eminent characteristic of judicial administration since the early 1900s. The next comparable feature has been the emergence of judicial administration as a profession in the 1970s. Although court unification started at the federal level in 1891, its pre-eminence has been at the state level, beginning with New Jersey in 1948, as a result of a successful campaign, led by the Chief Justice of its highest court, Arthur T. Vanderbilt. Since then, most other states followed in greatly varying degrees.

ORIGIN

In 1906, legal scholar Roscoe Pound credited the origin of court unification to the experience of the United Kingdom in the 1870s, which took this action with respect to its national court system. It eliminated levels of trial and appellate courts that had jurisdiction that overlapped, work that was duplicative and wasteful of judicial personnel, and operations that spawned long delays in the resolution of cases. He agreed with the popular aphorism that justice delayed was justice denied. Pound wanted America's state court systems (many of which encountered the same problems) to undergo an overhaul and adapt the new British model to their own circumstances. He thought that these

systems would become more effective if they compressed their several levels of trial courts into one or two and established only one appellate court, standing alone or as a branch of a single trial court with comprehensive original jurisdiction. Presiding over such a structure would be one judge, empowered to make court-related rules and to assign other judges from one division of a court to another, equalizing the distribution of caseloads.

Furthermore, Pound's advocacy was one part of the Progressive Era in American history (1900–1914), which sought in part to strengthen all branches of government at the federal, state, and local levels. Pound had looked to the United Kingdom for a model suitable to fortify one branch of government: the judiciary. Progressives like him lived at a time when the business world had become increasingly centralized and bureaucratic, as large corporations, monopolies, oligopolies, and trusts emerged. Their size made them effective but also, to progressives, dangerous to the public interest because of restrictions on production, exploitation of labor, unsafe products, and excessive prices. However, they were too powerful to be broken up as populists wanted. But, government might be strengthened enough for their effective regulation in the public interest. Only government had the potential to become a genuine counterweight to the growing concentration of corporate power and its increasing domination of the nation.

Effective regulation also necessitated a degree of government centralization: the creation of honest and competent government machines to fight corporate machines. Government had to be run more like a business to be more effective, as a future president, Woodrow Wilson, once wrote. The famous sociologist Max Weber saw such machines as forms of bureaucracy, which he viewed as the most effective model of organization, the one best way of organizing. In a complementary vein, management writer Frederick Taylor argued that, within bureaucracy, there was one best way of doing and supervising work.

A degree of countervailing centralization began at the level of the federal government, with the enactment of antitrust laws, the formation of independent regulatory commissions, and the strengthening of administrative capacity of the executive branch through

expansion of a civil service system, budgetary control, and the development of the presidential staff. Government centralization slowly spread horizontally and vertically. It first extended to the legislative and judicial branches of the federal government, which sought to manage their own affairs. They sought to emulate the executive branch and to avoid becoming dependent on it. They hoped to function as a bona fide coordinate branch of the federal government, roughly equal in power. Otherwise, government by separation of powers and checks and balances would have remained mostly a concept in constitutional theory, not an operational reality. The federal legislative response largely took the form of strengthening its oversight of the federal executive branch, through imposing a degree of due process on its operations through administrative procedure statutes, expanding its structure of committees and their staffing and developing its ability to provide its own alternatives to executive budgets.

FEDERAL COURT UNIFICATION

The federal judicial response mostly took the form of persuading the other two branches to divest themselves of their traditional but increasingly onerous role of managing numerous aspects of federal judicial operations and to permit the federal judicial branch to handle its own finances, personnel, information, and rules to virtually the maximum extent permitted by the U.S. Constitution. Between 1891 and 1984, a series of notable structures came into existence. Some ran counter to court unification, but others fostered it. On balance, they brought a degree of centralization to the administration (but not the structure) of the federal judiciary.

Three structural developments diluted such unification:

1. In 1891, a second level of federal appellate courts—circuit courts of appeal—was established to ease the workload of the Supreme Court of the United States, generated by the population growth, urbanization, and industrialization of the nation. Furthermore, in 1925 the Supreme Court was granted extensive control over its docket, which in 1988 was made virtually complete.
2. In 1968, a second level of federal trial courts, the U.S. Magistrates, was also established. These courts were to decide minor criminal and civil cases and thereby enable the original level of trial courts, the federal district courts, to focus on more complex cases.
3. Various specialized appellate and trial courts were created to relieve circuit and district courts

of some of their technical and complex cases but at the cost of structural fragmentation. These included the United States Tax Court in 1942, the United S. Court of Military Appeals in 1951, the United States Court of International Trade in 1980, and the United States Court of Appeals for the Federal Circuit (for bankruptcy challenges), the United States Court of Federal Claims, and the United States Tax Court, all in 1982.

However, other developments more than offset such movements from unification. In 1922, the Conference of Senior Circuit Judges (which became the Judicial Conference of the United States in 1948) was established to permit the federal courts to make recommendations to Congress as to what the rules governing federal judicial operations should be. Congress transferred its judicial rule-making authority to this body in stages: in 1938, for civil procedure; in 1946, for criminal procedure; in 1968, for appellate rules; and in 1975, for rules of evidence. These transfers virtually ended legislative domination of the federal judiciary. But in 1984, Congress backtracked by asserting a degree of authority over sentencing, a traditional judicial function. It established the United States Sentencing Commission and entrusted it with formulating strict requirements for the courts. In 2005, the Supreme Court of the United States turned the sentencing requirements into advisory guidelines.

In 1939, movement toward federal court unification accelerated. The Administrative Office of the United States Courts was set up, ending the actual dependence of the federal courts on the executive branch. This office allowed the federal courts to gather statistics, to prepare a judicial-branch budget, and to hire their own staffs. Before this office came into existence, these matters were handled by a federal executive branch agency, the Department of Justice, also the chief litigant in the federal courts. Moreover, a council for each of the federal judicial circuits was established to manage its own workload and judges. Thus, the circuit council, not the Supreme Court of the United States, became the administrative model for running the federal judiciary and served to limit the degree of centralization that took place. In addition, the circuit conference was also created to enable judges within each circuit to meet periodically and keep abreast of legal and administrative developments.

Other unifying developments deserve mention. In 1967, the Federal Judicial Center was set up to become the research, development, and educational arm of the national court system. In 1971, the office of circuit executive was created. Each circuit chose a professional court administrator to run its operations and to allow judges to spend more time discharging

their primary duty: adjudication. In 1972, the office of administrative assistant to the Chief Justice of the United States was set up. It was the functional equivalent of the circuit executive. In 1974, the office of district court executive became a reality for the nation's federal trial courts.

STATE COURT UNIFICATION

After spreading horizontally at the federal level, the quest for government centralization moved vertically after World War II, seeping down to the executive, judicial, and legislative branches of state and local governments. One reason remained the same: the widely perceived need to establish counterweights to centralization in the business world. The state executive and legislative branches roughly emulated their federal counterparts. The state courts, like their federal counterparts, sought to increase their administrative capacity to perform functions entrusted to the other two branches, to end their dependence on them, and to become a genuine coordinate branch of state government. However, unlike the federal courts, the state courts favored a degree of centralization to escape a second broad source of dependence—reliance on local governments, which handled fiscal and personnel matters affecting the courts. In practice, state courts were often appendages not only of the executive and legislative branches of state governments but also of the corresponding branches of county and city governments. To end such dependencies, state courts established a set of structures roughly parallel to those in the federal judiciary. But, overall, the states went beyond the federal government in pursuit of court unification, because, as legal historian Lawrence Friedman suggested, their judiciaries were more atomistic to begin with and thus provided more room for such change.

States replaced their multiple trial courts of overlapping jurisdiction with one level or two levels of trial courts. In some states, there was to be only one place where all criminal and civil cases were to be filed—in short, a forum with comprehensive, original jurisdiction. In other states, there were to be two levels of trial courts modeled after the federal judiciary: a general trial court to handle major cases and courts of limited jurisdiction to handle minor matters. In addition, 39 states have followed the federal model by establishing an intermediate appellate level between the trial courts and the highest court.

All states established a judicial council, analogous to the Judicial Conference of the United States. It is the one body that makes policies applicable to an entire court system and reduces (but usually does not eliminate) the control of individual courts over

their own operations. This structure promulgates rules regarding various aspects of court administration: finances, human resources, assignment of judges, jury administration, education and training of judges and court staff members, and management information systems. The judicial council selects a state court administrator, comparable to the Director of the Administrative Office of the United States Courts (one official who supervises a staff who carries out the council's policies and who serves at its pleasure). This administrator sometimes exercises close supervision over the operations of individual courts but generally leaves them with discretion within broad boundaries, to handle their own business through appellate and trial court administrators. In a highly unified system, such officials are appointed by the state court administrator, subject to the approval of the judicial council. More characteristically, individual courts are permitted to make the choice within broad guidelines. Thus, judges of the individual courts or their presiding judge select their own court administrator as well as the deputies, assistants, division heads, clerks, reporters, secretaries, analysts, planners, and security officers—especially since the 9/11 tragedy and the independent rise of threats to the safety of judges.

The state court administrator oversees the performance of numerous judicial functions, none more important than the budgetary process. The work of this official often involves the use of a unitary judicial budget, one budget formulated for all the courts in a state, subject to legislative review, as opposed to the authority of each court to devise its own budget, subject to the same limitation. The unitary judicial budget is based on the executive budgeting model, which originated in the Progressive Era and served as a method for advancing the degree of administrative unity in federal, state, and local executive branches. Previously, individual executive branch departments, like individual courts, had prepared their own budgets and submitted them to the appropriate legislative bodies for disposition. Furthermore, unitary judicial budgeting has often gone hand in hand with still another unifying concept, state court financing. In this, all state courts submit all revenues raised through their own actions (fines, fees, and forfeitures) to one place (the state general fund) and receive their funding through appropriations from one source: the state legislature. State unitary judicial budgeting usually accompanies state court financing, but the converse is not always true. For instance, California has state court financing but not unitary judicial budgeting. The federal judiciary has both.

The state court administrator, like the Director of the Administrative Office of the United States Courts, oversees another aspect of court unification: a judicial civil service system. All court employees are under the

supervision of one system, which hires, retains, promotes, transfers, demotes, fires, and retires them. Thus, courts gain control over all the people who perform judicially related duties. Previously, some employees who worked in the courts were members of the executive branch of governments. In state trial courts, for example, deputy sheriffs provided security but were county executive branch personnel. They were comparable to deputy marshalls, who performed the same function in federal courts but worked for an executive branch agency. Other court employees worked within an overall state, county, or city civil service system, which also included legislative and executive branch employees.

The state court administrator follows the federal counterpart with regard to other characteristics of court unification. First, this official exercises the authority to assign judges and court staff members across and within jurisdictions. The administrator can more effectively utilize such employees by shifting them temporarily to those jurisdictions where they are most needed—for instance, from courts with light caseloads (usually rural trial courts) to those with heavy burdens (mostly urban trial courts). Second, this official oversees the pre- and in-service education of judges and other court employees, typically offered in one place, a subdivision of the state court administrator's office. Third, the same official often supervises an integrated judicial management information system like that of the federal court system. This form of computerization links courts at the same level, courts at different levels, and all courts to the state court administrator's office. Information can be readily disseminated throughout the system. If, for instance, a court where defendants are appearing on one charge can find out where they are also wanted by another court, such as for violating bail or failing to pay fines or fees. Moreover, states have taken this form of unification a step further by moving toward integrating information systems among courts and between courts and other state and local justice system agencies, such as police departments, prosecutors' offices, and probation and parole offices. The federal courts are proceeding in a comparable direction.

State court unification also encompasses two other features, neither of which exists at the federal level. One is the establishment of a judicial performance commission, which represents one place where all allegations of judicial misconduct can be heard. Its decisions also exert a unifying impact on the behavior of state judges, subjecting them to one set of expectations and one range of sanctions from reprimand to removal. By contrast, at the federal level, councils for each of the circuits may discipline judges by steps short of removal, which requires impeachment and conviction. The other is merit judicial selection. In pure

form, it involves the establishment of one body—a judicial selection (or qualifications) commission, which examines the backgrounds of all possible candidates for state judicial vacancies at all levels and compiles a list of what it regards as qualified individuals. All candidates must be certified by the commission. When vacancies occur, the governor is required to fill them by selecting someone only from the certified list. In one variation, the process is reversed. A governor is allowed to nominate candidates, contingent upon subsequent (rather than prior) commission approval before they can take office. The commission is not required to compile a list of qualified candidates. Instead, it handles nominees on a case-by-case basis, approving or rejecting them as it deems appropriate. In another variation, a judicial election is added and held within several years after a candidate takes office, regardless of whether there was prior or subsequent commission approval.

DOUBT

The spread of court unification at the federal and state levels has taken place despite much doubt. One source is rooted in the entrenched political sway of localism. County and city governments, for example, do not want to relinquish their budgetary oversight and concomitant financial control over trial courts in their jurisdictions. Hence, they resist unitary judicial budgeting and state court financing. They also do not want to give up control over court personnel. Thus, they fight efforts to replace elected court clerks with judicially appointed court clerks or court administrators. And, they do not want to entirely let go of their responsibility for court security. Furthermore, justices of the peace do not want their offices to be eliminated and absorbed into a unified state court system. Typically, these officials are unsalaried, lack a legal education and a license, and derive their compensation from finding defendants guilty of minor offenses and fining them. They are often so politically well organized that their position is secured in the state constitution and, therefore, cannot be abolished by statute.

Another source of doubt is more intellectual than political. Some acknowledge that, for decades, the trial courts in most states were too decentralized, too subservient to local culture and pressures, and too individualistic. They were virtually unsupervised by the highest state court and varied greatly in their performance. They needed at least a degree of court unification, although exactly what that entailed should depend on the peculiar milieu of each state or jurisdictions within it. But, to such skeptics, court unification cannot be treated as a one-size-fits-all type of remedy for judicial dysfunctions across and within states.

Dogmatic fervor allegedly accompanies court unification and ignores the particular historical legal, political, economic, social, and cultural factors. A high degree of court unification may fit some environments but not others. Advocates of court unification often pursue their goal of a structurally simplified and centrally administered system despite the lack of contextual knowledge. Consequently, there is no one best way of organizing and managing court systems, regardless of the specific local circumstances. Thus, it is therefore as doctrinaire to view court unification like a law of nature as it would be to espouse decentralization under all circumstances.

CONCLUSION

This article has provided a brief description and analysis of six aspects of court unification: definition, preeminence, origin, federal courts, state courts, and doubt. However, most writings on the subject discuss it as if it were fundamentally a matter of structure and administration. The desired outcome is an increase in the number of case dispositions, a quicker flow of filings through trial and appellate assembly lines of judicial systems. The result is usually considered from an empirical rather than a normative perspective. There is insufficient consideration of whether the eventual upshot will be a genuinely more just court system, greater public satisfaction, and more widespread respect for the nation's potpourri of court systems. These are presumed to accrue in proportion to an increase in court unification as automatically as day follows night. Whether a higher level of justice has accrued remains uncertain.

INTRODUCTION

The formation, implementation, and evaluation of public policy are the responsibility of many actors. By constitutional design, U.S. public policy is articulated and influenced across the respective powers of divisions of democratic government. The judiciary constitutes one of those divisions of power. While few would argue that the powers of the judiciary facilitate judges' unilateral control of public policy, a debate exists as to just how influential the judiciary's voice is if we conceptualize governance as a dialogue among democratic institutions such as legislatures, executives, and judiciaries.^[1,2] For example, some observe that among the three branches of government, the judiciary is the least dangerous branch, and "next to nothing" in its lack of the purse (or legislative power) and sword (or executive power).^[2,3] Others view courts as more influential, dominating executive and legislative actors in particular policy areas.^[4–6]

We discuss these competing perspectives in greater detail below. Our general approach in this piece is that the power of courts over public policy in the United States is context dependent—both temporally and in relation to the other institutions of government.^[7] In other words, we consider when, and under what circumstances, courts influence policy.

In exploring these dynamics, we will first introduce fundamentals of the judicial impact debate and relevant features of the U.S. court system. We then discuss judicial discretion, or how courts "choose" and influence public policy. Lastly, we will look at the interaction between courts and other political branches, to evaluate the relative policy potency of the judicial branch.

JUDICIAL IMPACT DEBATE

Observers have long examined the impact—both in theory and in practice—of the judiciary on public policy. Hamilton's writings draw upon Montesquieu's observations that "of the three powers above mentioned,

the judiciary is in some measure next to nothing" (in Book 11, Chapter 6, Vol. 8, No. 78 of Ref.^[3]). Hamilton's reasoning is relatively straightforward:

The Executive not only dispenses the honors, but holds the sword of the community. The legislature not only commands the purse, but prescribes the rules by which the duties and rights of every citizen are to be regulated. The judiciary, on the contrary, has no influence over either the sword or the purse (in No. 78 of Ref.^[8]).

Such a view of the judiciary underscores a judiciary whose relative social impact is innocuous. Other scholars observe that "it is sometimes said that courts implement policies made by other branches of government. But for many issues . . . the opposite is true: the courts make policy, and other political institutions respond to their lead" (on page 193 of Ref.^[9]). To further explore the territory between these contrasting perspectives, we offer a discussion of the structure of courts within the United States.

U.S. COURT SYSTEM AND PUBLIC POLICY

The U.S. court system is hierarchical. One system of hierarchy exists at the state level, where each state in the United States has a system of civil and criminal courts. Generally, cases are brought before trial courts, where juries and judges make findings based on the fact and law. Appellate courts have the ability to review trial courts (although usually only the application of law from lower courts' decisions). Each state also has its own court of last resort, most commonly called a supreme court, which serves to review appellate judicial decisions. Decisions of the state courts of last resort can also be appealed to the U.S. Supreme Court.

Parallel to and sometimes overlapping state court jurisdiction, federal courts also handle decisions with potential policy implications. Across the country, there are 94 U.S. judicial districts, which are organized into 13 regional circuits, with a U.S. court of appeals in each circuit. A federal appellate court usually hears

appeals from the district courts located within its circuit, as well as appeals from decisions of federal administrative agencies. These courts of appeals are subject to the review of the U.S. Supreme Court.

The structure of the judicial system in the United States raises at least two considerations regarding courts and public policy. On the one hand, the hierarchical nature of the court system limits unilateral policy making on the part of any single judge or court. On the other hand, while the finality of the federal Supreme Court's decisions draws much national publicity, a vast majority of judicial decision making is executed at the state level and goes without appellate (state or federal) review. Partially a function of sheer numbers, only a small fraction of cases are filed (recently around 7500), and far fewer are heard (recently less than 100 per year) with the U.S. Supreme Court, when compared to the millions of cases filed annually in state and federal courts.

JUDICIAL DISCRETION

In addition to understanding court structure, judicial impact on public policy is also shaped by the doctrine of justiciability. This means that judges do not possess a roving commission to pick and choose actual, or forward hypothetical, disputes. Judges are confined to actual disputes that are brought before them, within their jurisdiction.

These constraints notwithstanding, the notion that judges can act as policy proponents is widely argued among scholars.^[10] Many observe that court decisions actively advance policy goals and that individual justice can influence public policy by selecting among justiciable cases legitimately before them. This is particularly the case with the U.S. Supreme Court and state courts of last resort (in those states where there are intermediate appellate courts), where appellate review is not mandatory. Even in most appellate courts, where review is mandatory, judges have developed creative ways of managing their workload.^[9,11] In other words, it may seem that judges are passive in choosing public policy areas, but many judges are able to pick cases that they are particularly interested in and ignore the others. This ability gives judges varying levels of discretion in selecting and advancing public policy areas. Judges can put items important to them on the agenda and use court rulings as tools to influence public policy.

While the life tenure that many judges enjoy is meant to provide insulation from outside political expediencies when ruling on cases, justices do not operate independently. In practice, judges face pressures presented by the legislative and executive branches, interest groups, and general public opinion.^[9,12] In court, these pressures have been demonstrated in

the form of pressure to defer to government actor litigants^[13,14] or to be sensitive to briefs filed by parties^[15]—especially government parties—not directly involved (*amicus* briefs). From this perspective, public policy outcomes from court decisions represent a sensitivity to, if not a reflection of, majoritarian views. This is discussed in greater detail in the following section.

INTERACTION WITH OTHER POLICY MAKERS

There are many contacts between Congress and the Supreme Court in the U.S. political system. Many federal court cases deal with whether federal statutes created by Congress violate the Constitution.^[16] When a court decides that existing statutes are unconstitutional, Congress may rewrite the statute or enact a new statute to advance the same goal as the old statute within the limitations established by the Court's decision.^[16]

Even if the new/revised statute passes, judicial bodies often have the chance to interpret the law, based on their understanding of Constitution. For example, in successive exchanges with legislative and administrative bodies, courts have designated very specific methods to achieve racial integration within public schools^[6] or have, over time, elaborated increased liability for public employee misconduct.^[17] As some scholars have observed, the legislative branch's ability to check iterative, judicial decision making is limited, unless the high hurdle of amending the Constitution amendment is overcome.^[18] Thus, while Congress holds the power of the "purse," it may be difficult to discern whether courts or legislatures are dominant in particular policy areas. Both actors have their ability to shape policy processes and outcomes.

Some research focusing on the Supreme Court demonstrates that these interactions and abilities can be strategic. Justices can predict responses from other branches before ruling on a particular case. If judges anticipate being overturned by Congress, they may choose a less controversial and more incremental advancement of their policy preferences.^[16] Congress, in turn, has relied on the budgetary process to impact judicial policy making. If Congress is in conflict with the Supreme Court, Congress may reduce the budget for the judicial branch. These budgetary signals from Congress have occurred historically, and past judges—such as Chief Justice Warren—have criticized Congress for taking these steps.^[19]

The judiciary also interacts with executive and administrative actors in the policy process. One obvious area of this interaction occurs because the chief executive appoints and influences the nomination of federal judges. The president can select judges who

may share certain political views. When the policy goals of the chief executives and a majority of judges deciding a particular case are the same, conflict is minimized. However, when policy priorities are in conflict, courts can detract from executive policy influence. A recent example still in contention is the Court's removal of presidential line-item veto power in 1998, which President Bush asked, unsuccessfully, to be restored by Congress in 2006.^[20]

Observers also note that courts frequently exercise public policy influence over administrative agencies. Courts might demonstrate this influence in multiple ways, including reformations of administrative law, articulation/refinement of constitutional duties,^[21] and modifications to public official immunity.^[17] The public administration literature has been particularly helpful in illustrating the policy influence of courts in the administrative arena. For example, O'Leary documented that courts very often take first seat in policy control because of conflicting political and social contexts.^[4] She observed that the EPA was often more influenced by federal court decisions than by political directives. While she noted a range of judicial behavior, from passive to aggressive, O'Leary discovered that from both the agency and the individual civil servant level, compliance with court decisions had become priority (on pages 561–562 of Ref.^[22]). Spriggs explains that “it is unlikely that agencies can expect Congress or the president to protect their overturned policies from the Court” (on page 1143 of Ref.^[23]). Research by O'Leary and Wise focusing on school desegregation argues that in the partnership of judges, legislators, and administrators, judges are the most potent of the triumvirate.^[5,6]

CONCLUSION

As the final arbiter in the judicial branch, the U.S. Supreme Court claims definitive authority over constitutional interpretation—the yardstick against which all public policy is ultimately measured. However, even Justice Felix Frankfurter echoed early phrases of the judicial impact debate: “The Court's authority—possessed of neither the purse nor the sword—ultimately rests on sustained public confidence in its moral sanction.”^[24] Courts certainly face institutional constraints. The legislative branch controls the budget to implement court policy, the executive branch controls policy administrative functions, and the public, moral sanction. Justices cannot effectively pursue their own policy goals in a vacuum.^[25] As an illustration of these constraints, Rosenberg argued that Court decisions, such as *Roe v. Wade* and *Brown v. Board of Education*, had marginal impact on social change relative to the greater political and social forces shaping public policy.^[26]

These considerations notwithstanding, judges influence public policy in many ways. In their often-repeated interactions with other branches, they can be strategic in predicating their policy decisions on anticipated responses of the political institutions.^[18] Judges also play a central role in our society that some argue is increasingly adversarial. Kagan^[27] suggests that with rise of “adversarial legalism” policy making is increasingly articulated in our court system, giving the judiciary increasing power in defining policy (see also Ref.^[28]).

Criminal Justice Public Policy

Barbara Sims

*School of Public Affairs, Pennsylvania State University at Harrisburg,
Middletown, Pennsylvania, U.S.A.*

INTRODUCTION

Perhaps one of the most complex of all public institutions is the American criminal justice system. With its myriad of agencies, each with a distinct and critical role, this open-ended system projects a picture of “doing justice” as though it were a well-oiled machine. People come in contact with the system through the police, and a decision is made at the street level whether that individual will stay in the system. If an arrest is made, the offender becomes part of a process that is often referred to as “assembly line justice.”^[1] Developing and implementing policies up and down the justice assembly line is no easy task. One jolt to the system can send rippling effects throughout all of these agencies, leaving criminal justice administrators in the unenviable position of having to make some rather “rushed” decisions. Even when administrators know that change is coming, as opposed to unplanned changes that occur as the result of events outside the purview of criminal justice agencies (demographic changes, for example, or drastic downturns in the economy), navigating the waters of how best to make those changes, and where, is not without its problems.

As is the case with any public agency, criminal justice agencies must constantly struggle on two major fronts. First, they must contend with a public that has become increasingly more concerned about crime and wants something done about it. Second, they must walk through political mine fields when attempting any approach to the crime problem. The result is that more often than not, crime policies are based on knee-jerk reactions to the more celebrated cases (O.J. Simpson, Willie Horton, etc.) as opposed to careful projections about the consequences of actions taken. It is those cases, after all, that are in the public eye, and as such, are closely paid attention to by the people elected to serve them.

As argued by Hancock and Sharp,^[2] many different groups have an interest in shaping crime policies, as it has become one of the most “popular for legislative, executive, and judicial manipulation and debate.” Sometime in the decade of the 1980s, the American criminal justice system moved from one of due process and concern for the constitutional rights of individuals to a crime control model seemingly intent

on incarcerating more individuals and for longer periods of time. The idea that “criminals” could be rehabilitated and turned into law-abiding citizens gave way to punishment as retribution, or “just desserts.” Americans began to see crime as the result of a lenient criminal justice system as opposed to wayward youth in need of assistance and supervision.

With “tough on crime” the new mantra of both major political parties, complete with phrases such as “war on crime” and “war on drugs,” the 1990s ushered in a time of unprecedented incarceration rates. The U.S. prison population rose from 196,429 in 1970 to 1.9 million in 1998, with the incarceration rate rising from 96 per 100,000 in 1970 to 452 per 100,000 in 1998. Compared with other countries, the United States is clearly out of step, with Japan at 42 out of 100,000 and Canada at 111 per 100,000.^[3] The new policies directed at waging the war on crime, and that resulted in this exponential growth in the incarceration rate, are the subject of this article. As will be illustrated, there are other negative consequences associated with these new crime policies in addition to skyrocketing corrections budgets that most state departments of corrections cannot afford. Further, a great deal of research has produced convincing evidence of certain policies that could work to curb crime in the United States. Findings from that research are also discussed, and an argument is made for a more sensible approach to the crime problem.

PUBLIC POLICY AND CRIMINAL JUSTICE

Dye^[4] defined public policy as anything that government chooses to do or not to do. Government leaders in the United States began using the “war” rhetoric when talking about crime policies beginning with President Lyndon Johnson in 1965, followed by Richard Nixon in 1969, and in 1989, President George Bush declared a war on drugs.^[5] As a result, policy makers have chosen to react to America’s crime problem, as Walker^[5] argues, by implementing certain “crime control fads,” such as “selective incapacitation,” or “three strikes and you’re out” legislation. These policies are in one day and seemingly out the next, and what government has not chosen to do is

to examine with some clarity the extent to which they do, or do not, work.^[5]

Problems Associated with Defining the Extent and Nature of America's Crime Problem

According to Welsh and Harris,^[6] the policy process begins by clearly defining the problem at hand. In the criminal justice policy arena, the problem is crime in U.S. communities. Determining the extent of the problem, however, is not without its problems. There are three ways that are used to measure crime in the United States, none of which is problem free. Referred to as official data, the Uniform Crime Reports (UCR) consists of collected and disseminated crime statistics as reported to the F.B.I. by about 16,000 local, county, state, and federal law enforcement agencies. The major problem with UCR data is the fact that it contains only reports of crimes known to the police and for which an arrest was made. Data from the National Crime Victimization Survey (NCVS), an annual survey of 60,000 U.S. households, seeks to uncover the so-called "dark figure" of crime by identifying those crimes not known to the police. NCVS data is criticized primarily for undercounting certain crimes (sexual and domestic abuse, for example), and because it does not contain crimes associated with businesses or commercial operations. Finally, self-reported studies ask people to disclose their crime and delinquency and may fill the gap between UCR and NCVS data. Those types of offenses often missed by both, public order crimes, for example, or drug use, may be more accurately measured through self-report studies. The major problem with self-report studies, however, is the fact that even guaranteed confidentiality and complete anonymity, individuals may not fully disclose their crimes to the interviewer.

Some criminologists have sought to get around the problem of reliability and validity when it comes to measuring crime by comparing the findings from different sources. The most successful of these undertakings have come from those comparing UCR data with NCVS data. Blumstein et al.^[7] for example, have found that, despite the different methodologies associated with both, similarities exist, especially for robbery and burglary. For policy makers, an awareness of the problems associated with any crime data is an important first step in the policy process.

Selective Incapacitation: Identifying and Locking up the Career Criminal

A good example of a modern-day criminal justice policy is that of selective incapacitation, a term used to describe the process of identifying and incarcerating

so-called "career criminals." Conservatives believe that if those individuals responsible for most of the crimes, those repeat offenders for which the threat of punishment does not appear to work, can be weeded out and targeted for long prison terms, crime rates will decline. The notion of the career criminal was first examined through cohort studies, the most well-known and respected of which is that by Wolfgang et al. in 1972.^[8] The authors tracked 9945 boys born in the city of Philadelphia in 1945 through their 18th birthday in 1963, using data from police reports, school records, and children and youth services. The overall finding was that the majority of all crimes (52%) associated with this birth cohort were committed by only 6% of these individuals. Approximately 627 of the 9945 individuals were identified by Wolfgang and his colleagues^[8] as chronic or career criminals.

When Wolfgang et al.'s^[8] results were published, crime rates had been rising. According to Walker,^[5] the time was ripe for any program that promised to get tough with chronic, repeat offenders. Selective incapacitation seemed like the perfect solution. The problem, however, is how best to predict future offending. In a thorough examination of the "prediction problem," Walker^[5] concluded that even if the criminal justice system could accurately identify the career criminal, the next hurdle for criminal justice policy makers would be to determine just how much crime could actually be prevented by incarcerating them. He argues that the three ways often used to predict criminal behavior might not be successful. Those three ways are: 1) the actuarial method, such as insurance companies use when predicting driving behaviors by certain groups, the young driver, for example; 2) examining prior criminal history; and 3) extensive clinical evaluations by the use of trained experts.^[5]

Attempts at predicting future violent behavior

When researchers have sought to develop instruments that can be used to predict future criminal behavior, they have often worked with a sample of incarcerated individuals. Wenk et al.^[9] examined closely the records of 4146 youths held by the California Youth Authority using an instrument that included information about prior criminal record coupled with the youths' histories of violent behavior and substance abuse. In this identified group of juvenile delinquents, 104 went on to become violent recidivists.^[9] Through a series of psychological evaluations and interviews, Wenk et al.^[9] discovered that only about half of the 104 recidivists were identified correctly. The remainder of the group were false negatives, that is to say, they were not predicted to become violent recidivists, but ultimately did. Further, 404 people who were predicted to become

violent recidivists did not. Had the instrument been used with the original sample and had the goal been to selectively incarcerate those predicted to become violent recidivists, these “false positives” would have been facing incarceration for violent crimes they would never commit.

The Wenk et al.^[9] study and others like it suggest that selective incapacitation is a policy that cannot succeed unless better prediction instruments can be developed to get around the problem of false negatives and false positives. In addition, prediction is further complicated by disagreement among researchers about just how much crime these so-called “career criminals” commit. As Walker^[5] points out, “If the averages are low (as some suggest they are), we will not get that much payoff in terms of crime reduction.”

“Gross incapacitation” versus selective incapacitation

Selective incapacitation, predicting future criminal behavior, will not work to reduce crime in the United States. The evidence suggests that the courtroom work group (attorneys, judges, jurors, etc.) is just as accurate as are prediction instruments. This means that the overall goal of this particular criminal justice policy is not feasible. Public policy is a fluid process, however, and what has happened in criminal justice is the rapid move toward “gross incapacitation,” “locking up a lot of people and sending them to prison for long terms.”^[5] The goal of carefully selecting individuals who are likely to cause the most harm to society has fallen away.

In 1987, a report titled “Making Confinement Decisions,” published by the U.S. Government Printing Office and authored by Edwin Zedlewski, purported to illustrate the public value of gross incapacitation. Using “costs to society” as his starting point, Zedlewski^[10] calculated that every dollar spent on incarceration actually saves taxpayers \$17. Other researchers have pointed out the problems associated with Zedlewski’s formula upon which his estimates were based (for an excellent review of the subject, see Ref.^[11]). Primarily, the critical problem is with his estimate of the number of crimes committed a year by criminals. Career criminals specialists cannot agree on what that figure might be, but Zedlewski chose the higher value of 187 crimes per year per criminal offender, as opposed to the more often used figure of about 18 crimes a year. Yet, policy makers relied heavily on Zedlewski’s^[11] calculation and continued down the path of gross incapacitation. One of the best examples of such a policy is mandatory sentencing laws, more commonly referred to as “three-strikes and you’re out.”

Three-Strikes Legislation

Mandatory sentences are extremely popular with the public and with elected officials. This popularity comes from, as noted above, the media play of some criminal justice cases. When 12-year-old Polly Klass was kidnapped and murdered by a twice-convicted felon named Richard Davis, out on parole at the time of the murder, the citizens of California were outraged. This outrage led to California’s three-strikes law, soon followed by other states. Today, 26 states have some sort of mandatory sentencing statute. The major premise of these laws is that for the third convicted felony, offenders will receive a life sentence in a state prison.

The goal of mandatory sentencing

Just as selective incapacitation is a policy aimed at reducing crime in the United States, so is mandatory sentencing. A major step in the policy process is to ensure that the targeted population is clearly defined and that steps to reach that population are equally clear. Determinations as to the feasibility of the proposed policy are crucial prior to implementing major changes. As mentioned above, the courtroom work group works not unlike other street-level bureaucrats to put up roadblocks to the implementation of newly enacted crime policies. This use of discretion has been described by Lipsky^[12] as a more important deciding factor as to how policies will be implemented than is the power of the executive or legislative branches of government, the sources of many crime policies.

Through mandatory sentencing, states are able to send a message to the public that something is being done about crime. This message meets the goal, in policy terms, of engaging in symbolic politics.^[13] Once again, a public in fear of crime has been reassured that government is cracking down on felony recidivists. Interest groups, those rallying around the family of young Polly Klass for example, are able to influence state legislators. Through widespread media footage of proposed mandatory sentences, the political climate becomes ripe for such legislation, as indicated by a series of public opinion polls.

Based on an excellent analysis of the policy process as it applies to “three-strikes” legislation, Welsh and Harris^[6] came to the conclusion that this law was doomed to fail because of poor planning. They posed the question, “What evidence was used to demonstrate a need for change in U.S. crime policies dealing with felony offenders?”^[6] As was pointed out above, although the perception in society was that crime was rising, actually, it had been declining. Thus, instead of working to assure the public that crime was not on the rise and to educate the public about the negative consequences that sometimes come with poor planning,

politicians were “too eager to cater to the perceived public will, rather than documented problems.”^[6]

Implementing three-strikes legislation

Welsh and Harris^[6] pointed out that prior to the implementation of any policy, all parties involved in that implementation should be fully apprised of their responsibility. The policy process requires brainstorming about possible obstacles to implementation and how those obstacles will be overcome. It became clear almost immediately that mandatory sentencing laws would be met with resistance or simply ignored. Why? The answer can be found again in the manner in which employees in bureaucratic organizations apply discretion in the everyday job of doing the public's business.

Welsh and Harris^[6] described the plea bargaining process, for example, and the manner in which prosecutors circumvent the law by reducing the charges. Mandatory sentencing laws give the prosecutor a tool to dangle before offenders in an effort to get them to plead guilty. Police officers may engage in more selective arrest policies, and at the federal level, it has been shown that the law has been used sparsely since its inception in 1994.^[6] Walker^[5] pointed out that Tennessee, New Mexico, and Colorado have not used their three-strikes law at all, and that Wisconsin only used its law once in the first two years after it was enacted.

Evaluating three-strikes laws

In the policy process, it is important to determine to what extent the goals and expected outcomes are being met. Evaluation research provides public agencies with this critical information. With three-strikes laws scarcely being used as they were intended, however, evaluating the impact of them is tenuous at best. The finding that criminal justice personnel often ignore the law or somehow get around it is the type of information that comes from what is termed “process evaluation.” Unlike impact assessments that provide outcome or impact measures of the new program, process evaluation is designed to determine whether any new program was implemented the way it was intended. Clearly, the usurping of the law by the courtroom work group means that these types of sentencing structures are not being implemented the way they were intended.

First, mandatory sentences add a tremendous burden to an already-overworked criminal justice system. With more at stake, defendants who are in a district where mandatory sentencing has been fully implemented are demanding jury trials. In California, third-strike cases represent about 24% of all trials, raising

court costs for local counties. Too, the increase in the number of defendants waiting in jail for their trial dates has resulted in astronomical increases in local corrections budgets. In Los Angeles, the new three-strikes law cost the county an additional \$169 million in the first two years of its implementation.^[5]

Another important piece of evidence from attempts to evaluate mandatory sentences is that they probably do little to bring down crime in the United States. On one hand, and as pointed out above, it is difficult to argue that such laws are tailored toward identifying an individual's propensity to commit future crime.^[5] On the other hand, Walker^[5] argued that under such a policy, older offenders are likely to end up in three-strikes statistics at about the time they would have naturally aged out of the crime-prone years. This means that there are more and more older people being sent to prison, and costs associated with housing the elderly inmate are quite substantial, adding even more to correctional budgets.

Welsh and Harris^[6] summarized the projected effects of California's three-strikes law by stating that fully implementing this policy will:

- Triple California's prison population over the next 25 years.
- Cost an average of \$5.5 billion more each year for the next 25 years.
- Corrections could consume 18% of the state's spending by the year 2002.

PROMISING APPROACHES FOR CRIMINAL JUSTICE POLICY MAKERS

The above discussion about two modern-day crime control policies was used as a backdrop for demonstrating that not unlike any other public institution, policy making in criminal justice is often driven more by symbolic politics than sound policy analysis. The nation's “war on crime” and “war on drugs” rhetoric has created “get tough” approaches targeted toward the so-called “career criminal” and major drug dealers. Much of the literature suggests, however, that these policies have failed, by not being implemented correctly or by not doing much to reduce crime rates. Instead, these policies have produced a plethora of negative backlashes against an already over-extended system. This leaves many forward-thinking and innovative criminal justice administrators thinking seriously about what *can* work to curb serious crime in local communities.

Programs such as Pennsylvania Governor Mark Schweiker's “Weed and Seed” programs, a state-sponsored offshoot of the federal government's program by the same name, are beginning to stress

approaches that are founded in research. Weed and Seed programming calls for the “weeding out” of hot spots of crimes in specially targeted areas by local law enforcement, in conjunction, in some cases, with the State Police. “Seeding” programs then seek to involve community-based agencies in a joint effort to provide these targeted areas with critical resources needed to correct problems found to be conduits for crime. Terminology such as “research-based” initiatives, “blueprints for change,” and “best practices” is emerging in the Weed and Seed policy arena, not only in Pennsylvania, but also in similar programs around the country.

These research-based initiatives are just that: programs that have been evaluated and found to have a positive impact on local communities and their ability to curb serious and violent criminal activity. Funding from state and federal sources is being tied to conditions placed on grant recipients to conform to specific guidelines for program implementation and future evaluation of the new programs coming on line. The balance of this chapter examines some of these programs and argues for a more “sensible” approach to the crime problem. This approach is grounded more in sound policy analysis and processes and less in symbolic politics.

Research-Based “Promising Approaches” to Curb Crime in U.S. Communities

In 1998, Lawrence Sherman and his colleagues^[14] at the University of Maryland released a report to the National Institute of Justice in which they summarized a comprehensive review of evaluation research in the area of crime prevention. In the report, entitled “Preventing Crime: What Works, What Doesn’t, What’s Promising,” Sherman et al.^[14] identified seven institutional settings in which these promising approaches take place: 1) communities; 2) families; 3) schools; 4) labor markets; 5) places; 6) police agencies; and 7) other agencies of criminal justice. The authors first distinguished between the terms “practice” and “program,” a distinction that is important for policy makers and practitioners. They suggest that a practice is any activity that is continuous in a particular setting, and it can only change if a new government policy restricts it or takes the place of the old practice. A program, on the other hand, is much more specific. It is a *focused effort* to affect change in a crime prevention setting. As such, unlike routine practices, actual program implementation and continuation requires a continuing source of resources. Given the amount of resources going toward crime prevention programs, it is not surprising that the Department of Justice would have a great interest in the findings from an examination of any evaluation of those programs.

The Maryland Report, as the Sherman et al.^[14] study has come to be called, takes a great deal of evaluation research and condenses it into more simple terms. At the end of each chapter, where various authors addressed those programs associated with the above-identified seven institutional settings, there is a concluding section that summarizes “what works” and “what doesn’t.” Beginning with the community setting, it appears that what will work to bring down crime is gang violence prevention focused on reducing gang cohesion and mentoring programs targeted toward 10- to 14 year-olds. What does not work at the community level are community mobilization efforts and gun buyback programs, both of which have received a great deal of attention and press coverage in the recent past.

Family programs identified in the Maryland Report as being promising are long-term frequent home visitation programs that have been shown to reduce child abuse, and family therapy for delinquent and predelinquent youth. In the school setting, programs aimed at improving communication about rules and behavior norms appear promising (anti-bullying programs, for example), as long as those rules are consistently reinforced. Also, comprehensive instructional programs that focus on such issues as stress management, problem solving in social settings, and self-control, and that are maintained over an extended period of time, appear promising. To bring down substance abuse by young people, behavior modification programs, in addition to the comprehensive instructional programs previously listed, are needed, according to Sherman et al.^[14]

Programs that do not work in the school setting to reduce substance abuse are peer-group counseling sessions and single efforts at offering more recreation activities. Further, Sherman et al.^[14] concluded that education programs based on fear arousal, moral appeal, and information dissemination will not work to bring down the use of drugs by young people.

When it comes to labor market programs aimed at reducing crime in U.S. communities, Sherman et al.^[14] identified such programs as short-term vocational training programs for older male parolees. Promising approaches include intensive training programs (Job Corps, for example) for at-risk youth, prison-based vocational programs for adults, and the development of Enterprise Zones. What does not work, according to Sherman et al.^[14] are subsidized work programs for at-risk youth and pretrial diversions for adult offenders (making employment training and finding a job a condition of case dismissal).

Targeting “places” and policing programs can work together to prevent crime in local communities but only under certain conditions.^[14] These two approaches are often termed “situational crime

prevention through problem-oriented policing.” One of the more promising approaches is one in which some form of crime analysis is conducted (mapping of types of serious crimes, for example) followed by a well-designed police effort in those targeted areas. In fact, of all the studies examined in the area of policing, Sherman et al.^[14] argued that none other is effective as a clearly, focused program. Simply putting more police on the streets is not going to do much to bring down serious crime. Saturated patrol may have some short-term effect, but that effect fades over time without a more focused, targeted approach.^[14]

Finally, and in the area of corrections, evaluation studies point to the conclusion that the following programs can work to reduce repeat offending: prison-based therapeutic community treatment of drug-addicted offenders; structured and focused treatment programs that use multiple components; programs that allow for a substantial amount of contact between the treatment provider and the offender; and programs that address the characteristics of the client.^[14] As alluded to above, programs that focus only on incapacitation, and that lock up less serious offenders for longer periods of time, are likely to be extremely expensive and to not do much to bring down serious crime.

SUMMARY AND CONCLUSIONS

This “tip of the iceberg” summary of the many studies examined in the Maryland Report suggests that there is ample evidence on which criminal justice policy makers and practitioners can rely when it comes to making critical decisions about program changes in the criminal justice system. The move toward incarcerating more individuals and for longer periods of time, while symbolically pleasing to many, may have failed as a crime prevention approach. Practices such as gross incapacitation through mandatory minimum sentences have been shown to overburden the criminal justice system while not doing much to reduce recidivism. More sensible approaches to the crime problem seem warranted, and research-based initiatives are appearing as blueprints for needed change. The question becomes, “To what extent are policy makers and practitioners willing to pay attention to such reports as those produced by Sherman and his colleagues?”

Petersilia^[15] has argued that research has affected how policy makers “*think* about issues, problems, and the range of viable solutions.” In her example, it is the *conceptual* use of research findings that may be more pronounced than the so-called *instrumental* use of research findings. In other words, although the effects of research on policy development may not always be measured and thus can be easily missed,

the effects are there, nonetheless, and present themselves in more subtle ways. The word gets out. It may not come through an examination of peer-reviewed journal articles by criminal justice practitioners, but there is now a substantial amount of reporting of program evaluations appearing in trade journals and being posted on government web sites to support an argument that research findings are now being disseminated beyond mere academic circles. As stated above, many sources of funding are tying that funding to programs that are research based. Making use of criminal justice research in the policy process has actually begun to take place.

Criminal justice research is better preparing practitioners and policy makers to analyze the problem at hand. The policy process is informed, through the research, about the history of the problem and the outcome of previous interventions. Using the information gained in this first step of the process, goals and objectives of any new program can be determined. The process can then move toward a discussion, by key stakeholders, about the feasibility of implementing the new program, including brainstorming about any obstacles that might be faced at that point in the process. During the actual designing of the new program, the research findings add even more to the mix through assisting policy makers and practitioners in determining the target population, how clients will be selected, and even what type of staff will be needed to fill the new positions created by the program. Finally, building in an evaluation component is critical to new program development and implementation. Impact evaluations of the new program can be used then to make any necessary changes to the new program and to guide others in development and implementation of similar programs.

As Welsh and Harris^[6] argued, “Rarely does planning go smoothly, and it takes willpower, a clear vision, and lots of communication to remain rooted in the planning process.” They also add that “planned changed” is better than ad hoc decision making, and that it “increases the likelihood of successful interventions.”^[6] With the safety of the community at stake, planned changes in the criminal justice policy arena, following closely the policy analysis process as well as research-based recommendations for what will work to accomplish that goal, are most certainly called for.

Crisis Policy-Making and Management in Southeast Asia

Scott Fritzen

Public Policy Programme, National University of Singapore, Singapore

INTRODUCTION

Crises severely test the capacities of bureaucracies, politicians, and, at times, the overall resilience of political, economic, and social systems. Studying crisis management across country contexts enables the exploration of systemic capacities and policy-making patterns as these undergo (at times, extreme) stress. This review briefly introduces a framework for cross-country analysis and applies to Southeast Asia. It has four sections. First, it presents hypotheses for how different crisis types interact with country governance characteristics to influence decision making. Second, summary characteristics of crises influencing policy making and management are presented for a range of crises that have affected Southeast Asia in the past 10 years. Third, regional responses to the emergence and spread of the Severe Atypical Respiratory Syndrome (SARS) virus in 2003 are analyzed as one example of interconnections posited between governance characteristics and crisis management. The concluding section explores implications of the framework for those interested in improving the robustness of crisis management in the region.

CRISIS DECISION MAKING AND GOVERNANCE CHARACTERISTICS

Analytical frameworks for comparing crisis decision making across national boundaries are at an early stage of development, in contrast to the considerable literature that exists on individual types of crisis, such as terrorism or natural disasters (see the *Handbook of Crisis and Emergency Management*^[1] for comprehensive coverage). Two types of generalizations are likely to be important for future work in this area.

The first stems from the pioneering work of Grindle and Thomas,^[2] who analyzed ways in which problem characteristics and context help determine patterns of policy decision making. Distinguishing between “crisis-driven” and “bureaucratic politics-as-usual” reform contexts, they find that decision making in the latter case is likely to be addressed at senior levels of government and to be strongly influenced by the need to maintain regime stability. Together with Kingdon,^[3] they also stress the importance of the

leadership abilities of “policy entrepreneurs,” who are shown to make a profound difference on outcomes even in resource-poor environments.

Building on the Grindle and Thomas dichotomy, we can posit that “not all crisis are created equal.” Different types of crisis will “trigger” different decision-making modalities. Four characteristics seem particularly important:

1. Degree to which a problem threatens overall regime stability. Ability to threaten the tenure of senior leaders became in effect a defining characteristic of a crisis in Grindle and Thomas’ framework, but it is clear that different types of crisis threaten *political* stability to very different degrees; it is also clear that the impact of the same type of problem on political stability will vary between regimes. The greater the degree to which regimes and incumbents are threatened by a crisis, the more decision making will tend to be dominated by the political calculus of senior officials.
2. Degree to which a problem is potentially amenable to a “technical” solution. The effectiveness of decision making in crises involving considerable technical complexity (such as environmental protection) will in large part be determined by the bureaucratic capacities that exist in a given system.
3. Degree of cross-national spillover involved. Interstate crises raise the complexity of problem solving by forcing decisions to be negotiated with multiple stakeholders, both within and outside of a polity. The greater the spillover effect, the more outcomes will be shaped by the effectiveness of regional forms of cooperation and by differentials in power between states.
4. The continuity of issue as crisis (whether short-acting or chronic). All crises, by definition, thrust themselves unpredictably onto the policy agenda. Some, however, are recurring in nature—sometimes over decades—such that precedents and “organizational repertoires”^[4]—patterned national and bureaucratic responses to a given problem—are triggered with each recurrence of the crisis. In unprecedented crisis contexts, the role of individual leaders in shaping

responses may be highlighted to a greater extent than in the case of “chronic” crises.

A second broad generalization, to date insufficiently explored in the literature (but see Grindle^[5]), is that state capacities matter in crisis management. A strategic approach to crisis policy making and management^[6,7] focuses on three categories of capacities:

1. *Political and leadership capacities*, which, as the name implies, has two aspects depending on whether the capacities involved adhere primarily to an individual or to the system as a whole. A critical feature is the way political leaders (or, in rarer cases in Southeast Asia, policy entrepreneurs outside government) direct attention to a problem in a manner that shapes how the crisis is perceived.
2. *Bureaucratic and process capacity* involves the ability to manage a high-quality decision-making process during a crisis^[8] and to execute decisions taken with predictability and control. This is a profoundly institutional capacity resting on many foundations: a well-functioning bureaucracy, clear information systems and resources (both manpower and fiscal) to tackle implementation challenges that arise.
3. *Social capacity* in times of crisis relates to the willingness of social or economic groupings to accept overall government coordination and/or to participate in the constructive response to the crisis.

Looking across these categories, one can make what might be called the “weakest link” hypothesis. Any

given crisis may invoke multiple types of decision-making responses and rely for its resolution on multiple capacities. Yet some capacity constraints will be more binding for the “successful” management of crises than others. For politically sensitive crisis points, a governance system’s political capacities will, in particular, be tested, and crises involving high technical complexity will depend heavily on a system’s bureaucratic capacity. Crises with high spillover effects, in turn, will depend prominently on the strength of mechanisms for interstate cooperation—a capacity that in Southeast Asia has been growing steadily over the past two decades, but which is still stretched thin.

COMPARING CRISIS CHARACTERISTICS IN SOUTHEAST ASIA

Multiple kinds of crisis have affected Southeast Asian countries of the past 5 years or so, each with different characteristics based on the framework above (Table 1). These can be divided into three groupings that suggest different hypotheses for future research.

The first grouping includes chronic, largely political problems that are generally not amendable to any obvious “technical” solution, but are also unlikely to precipitate regime change on their own. Terrorism, internal violence, secession struggles, and human rights disputes all might fit into this category. In between inevitable crisis points, these problems have tended to simmer without resolution where they have affected low-capacity political systems (as in Indonesia or Cambodia). Their resolution will depend on the degree to which political and adaptive capacities develop in, as yet, weakly institutionalized democracies.

Table 1 Characteristics of crises buffeting Southeast Asia since 1997

	Technical solution	Spillover	Regime threat	Continuity
Health (SARS, bird flu)	High	High	Low	Low
Health (HIV–AIDS)	Moderate	Moderate–high	Low	High
Terrorism (e.g., response to Jemmah Islamiyah)	Low	High	Low	Moderate
Economic and financial crisis (1997–1999)	Moderate	Moderate	Moderate–high	Moderate
Regime challenge (e.g., “People’s Power II” or the fall of Soeharto)	Low	Low	High	Low
Interstate dispute (e.g., Cambodia–Thailand “Angkor Wat” incident in January 2003)	Moderate	High	Low	Low
Internal civil violence (e.g., Maluku unrest)	Low	Moderate	Moderate	Moderate
Secessionist struggles (e.g., Aceh, Mindanao)	Low	Moderate	Moderate	High
Human rights problems in regional countries (e.g., ASEAN response to Myanmar’s detention of Aung San Suu Kyi in May 2003)	Low	Moderate	Low	High
Environmental dispute (e.g., Indonesia–Singapore “smog” problem, 1997)	Moderate	High	Low	Moderate

A second category of problems includes technical problems with high “contagion,” moderately capable of threatening regime tenure. Handling of epidemic outbreaks and regional economic crises, such as (notably) the East Asian financial crisis beginning in 1997, fall into this category. Outcomes in these cases depend, to a large extent, on problem continuity and the technical capacity and interest of the affected governments to address the problems. Addressing major problems of high contagion in this manner clearly goes beyond the capacity of less-developed Southeast Asian countries, which must therefore rely, to a large extent, on regional management mechanisms. As shown by the SARS example below, the degree to which bureaucratic capacity and interstate norms can simultaneously develop becomes critical to the eventual resolution of crises in this category.

The third category involves direct challenges to government tenure, extending in the extreme to challenges to the entire governance system (as in Indonesia during the fall of Soeharto). These are, of course, political crises points, the resolution of which depends on the balance of state capacity, legitimacy, and institutionalized conflict-management mechanisms built up over the history of the polity concerned.

RESPONDING TO A CRISIS OF UNKNOWN PROPORTIONS: THE CASE OF SARS IN 2003

Different responses in Southeast Asia to the outbreak of a new and deadly disease—Severe Atypical Respiratory Syndrome (SARS)—serve as an illustration of the interaction effects of crisis and governance characteristics. SARS originated in southern China in November 2002, reached Hong Kong in February 2003, and peaked in May 2003, by which time it had spread eventually to over 25 countries. It was to cause just fewer than 800 deaths before its chain of transmission was declared broken in all countries in July 2003. Of the 10 worst affected countries, seven were in Asia, foremost among them mainland China, which accounted for almost 90% of worldwide cases.^[9] This health crisis gripped the public imagination in a manner much different from the far more devastating HIV virus, in part because it erupted in a short time, caused widespread uncertainty (including over transmission modalities and fatality rates) and massive economic costs to the countries worst affected. SARS posed a tremendous challenge above all to East and Southeast Asian countries and territories that bore the brunt of the disease—seven of the 10 worst affected countries were in Asia.^[10]

The SARS epidemic had a high technical content; the policy response to SARS was predicated on getting

better information on transmission routes and effective mechanisms of control. It was moderately threatening in political terms, with fears concentrated on the potential economic costs as well as the social fallout from being seen to handle the virus incompetently. Of course, SARS had high international spillover (and therefore generated high amounts of pressure from the international community for affected countries to institute transparent control mechanisms). Despite sharing these crisis characteristics, the way the SARS virus was handled differed substantially in China, Vietnam, and Singapore in ways that shed light on the intersection of governance qualities and crisis-management modalities.

In Vietnam, early detection of the virus and a swift response led to eventual containment. The government’s response drew praise from the World Health Organization (WHO):^[11] “Vietnam demonstrated to the world how a developing country, hit by an especially severe outbreak, can triumph over a disease when reporting is prompt and open . . .” Partly, the response was one of luck, as a rapid initial effort to contain the spread was successful. As was shown eventually in neighboring China, this success was a function of effective dissemination of information through Vietnam’s some 10,000 rural health centers, demonstrating that even in relatively poor countries, infrastructural and organizational capacities, once mobilized, may be impressive. The resolution of the SARS outbreak in Vietnam, and the slower but eventually effective response in China, was multifactorial, “involving improvements in management and triage in hospitals and communities of patients with suspected SARS and the dissemination of information to health care workers and the public.”^[12]

It is the initial Chinese response that calls for further analysis. Information regarding the true extent of the outbreak in China was suppressed for some weeks before the government launched a full-scale attack on the disease. The normally diplomatic (by necessity) WHO noted as much, saying, “SARS is now known to have begun in mid-November [2002] in Guangdong Province. Cases during the earliest phases of the SARS outbreak there were not openly reported, thus allowing a severe disease to become silently established in ways that made further international spread almost inevitable.”^[13] Harsher assessments were found in the international press, with *The Economist* magazine^[14] likening the Chinese performance to that of the Soviet Union during the Chernobyl disaster. It was as the international spotlight fully glaring on the Chinese that the stakes, in terms not least of national image, became great enough for the central leadership to initiate its rapid and comprehensive course correction that finally led to an effective response.

Singapore generally drew high praise for its response to the outbreak. As an international trading and tourist hub, Singapore clearly stood to lose a great deal to the virus. The government's early response to it was to pull no stops; virtually all containment measures imaginable, including use of military forces to enforce quarantine requirements,^[15] were taken with alacrity. The leadership was engaged in a high-profile manner in communicating information regarding the latest occurrences of the virus and its transmission mechanisms. A recent review of Singapore's experience, based on a survey of 1200 Singaporeans, found that respondents evaluated highly the authorities' management of the SARS crisis, with a special emphasis on their openness to communication. The authors also pointed to the importance of social capacity in responding to the virus, finding "a relatively high level of social discipline in the population."^[16]

Singapore, Vietnam, and China are all authoritarian states generally capable of mobilizing society behind high-priority national decisions society unencumbered by legal niceties and challenges. However, in this type of crisis, technical capacities and leadership—the ability of the authorities to grasp the situation at the grassroots and their willingness to act in a transparent manner on this information—mattered more than the macrogovernance characteristics of the regimes. As a technologically savvy city-state, transaction costs to access information about what was "really" happening over the course of the disease were reasonably low in Singapore, whereas the complexity of governing the world's most populous nation, coupled with classic distortions in center-periphery communications in China, led to its central government initial incapacity to take action transparently to thwart this emerging crisis.

IMPLICATIONS

Regime characteristics and systemwide capacities clearly matter in determining crisis-management outcomes. Three types of capacities can be examined, in particular, country contexts—political, technical, and social. Overlapping their boundaries are two additional "meta-capacities:" for systemwide learning and adaptation and for effective international cooperation and lesson sharing. Mechanisms for responding collectively to problems of high technical complexity are still at an early stage of development in Southeast Asia, although—as demonstrated in part by the SARS example—they are improving.

The characteristics of crises themselves also matter, and this has implications for those seeking to shore up regional capacity to address crises in Southeast Asia. Technical capacities will be particularly important

where the crisis context allows decision making to proceed in a relatively politically neutral fashion (unlike the early response to SARS in China). Reformers seeking better crisis management in such cases might hope to mobilize external parties affected by the issue—i.e., to raise the "spillover" salience of an issue—in order to prompt better cooperation and national responsiveness.

Where political motives are paramount in responses to crisis, answers will be more complex. Systems of conflict resolution are needed at the regional level that are both technically and politically viable. The influence of NGOs and others in keeping unpopular issues on the policy agenda will be essential, as will ongoing attempts to open policy making to greater external scrutiny and input. Although state capacities to handle crises in Southeast Asia are highly uneven, robust institutions to manage political transitions and accumulated social pressures are in fairly short supply in most Southeast Asian countries.

Customer Service

Evan M. Berman

*Public Administration Institute, Louisiana State University,
Baton Rouge, Louisiana, U.S.A.*

INTRODUCTION

Customer service is the activity of identifying and satisfying the needs of customers. In public organizations, the term “customer” is broadly used to include program clients, external customers of public organizations, internal customers (for example, employees who depend on the service of other employees in the same public organization), and citizens. The term “customer service” is sometimes also used to connote a standard, such as in the statement: “The customer service in this public agency is world class.” Customer service is currently viewed as essential to maintaining sound stakeholder relations.

RECENT DEVELOPMENT OF CUSTOMER SERVICE IN THE PUBLIC SECTOR

Although customer service is arguably as old as public administration, the importance of providing customer service by U.S. public organizations dramatically increased in the mid-1980s. This increased emphasis followed that of U.S. corporations in the late 1970s and early 1980s, during which period U.S. corporations lost market shares to Japanese and other foreign firms. These firms had innovated a new approach to product development based on the rapid utilization of customer feedback. The new approach, based on a management philosophy called “Total Quality Management” (TQM; see below) resulted in products with superior reliability and more user-oriented features. American firms quickly and successfully copied the new management philosophy that emphasized customer service in an effort to counter the advantage that foreign rivals enjoyed. Later, this new management philosophy was widely adopted by other organizations; TQM was broadly introduced into the federal government during the late 1980s, and local and state governments followed in the early 1990s.

In broader context, the period of the late 1970s and early 1980s is seen as a nadir in stakeholder trust toward American private and public institutions. Trust in the federal government reached a record low in the early 1980s. Whereas in the mid-1960s about 62% of respondents answered the question: “How often do

you trust the federal government to do what is right?” with “most of the time” or “some of the time,” by the early 1980s, this percentage had dropped to about 18%. It is probable that concerns in the late 1970s and early 1980s of high unemployment, high inflation, two energy crises, and deceit by elected officials (for example, Watergate) contributed to broad public distrust, as did poor service to program clients and citizens. State and local governments enjoyed a higher level of trust but were not immune from public apathy and cynicism. With 20/20 hindsight, the turn to customer service in the public sector can be viewed as an effort to address causes of citizen distrust that were narrowly related to program quality and service. The mantra “to run government as a business” (that is, borrowing management practices from the private sector) regained importance as a dominant ideology in the late 1980s. Although some critics regarded the customer service emphasis as a blind adoration of capitalist values and as inconsistent with the fiduciary and political responsibilities of government, most observers believed that an increased orientation toward customer service was long overdue in government, as it had been in business.

Customer service is an integral part of TQM. This management orientation emphasizes meeting customer needs through a comprehensive strategy that encompasses empowerment, process analysis and improvement, customer service, partnering and performance measurement, and benchmarking.^[1] Although initially organizations attempted to implement TQM as a coherent management strategy, today it is widely regarded as a management philosophy that encompasses a broad range of specific strategies, among which is customer service. As a management philosophy, the core values of TQM are to: 1) identify, meet, and exceed the needs of customers (and other stakeholders); 2) strive to produce services right the first time (that is, reduce errors that upset stakeholders and cause rework and increased costs); 3) use systematic analysis to evaluate and improve services delivery; and 4) consistently support workers in their efforts to improve quality and meet customer needs. TQM invites managers to think broadly about customer service and needs and to develop innovative approaches to improve service delivery. Many applications of

TQM begin with emphasizing meeting and exceeding customer expectations, in part by focusing on customer complaints. Hence, customer service is usually the first strategy in TQM efforts. Other strategies that affect customer satisfaction are discussed below.

Generally, the principles of establishing a customer service strategy involve addressing the following questions: 1) How do our long-term plans serve the needs of our customers?; 2) What specifically do customers expect from us?; 3) How can we exceed their expectations?; 4) Are we exceeding customer expectations?; 5) What can we do to further improve upon our satisfaction of customer expectations?; and 6) Do we have the capacity to meet our customer service goals? Regarding the latter, is the commitment of managers and employees as well as technology infrastructure, consistent with our customer service goals? If not, how can we improve?

THE IMPORTANCE OF ORGANIZATIONAL CULTURE

Widespread agreement exists that customer service outcomes reflect an organization's values, that is, the daily expectations and practices of organizational members as they deal with customers and plan their work. All organizations have expectations for how staff should deal with customers; they vary with regard to these expectations, including the extent that customer service is viewed as being important. At issue are not generally espoused values such as "we value our customers highly," but rather the specific guidelines that all employees and managers are given as they go about their daily work. The specifics matter, because general statements provide little guidance and assurance in the face of specific daily challenges. Some examples of specific customer service values that are found in organizations are the following:

- We always stay focused on resolving the customer's problem or need.
- We value changing what or how we do it to increase customer satisfaction.
- We want our customers to think good things about us.
- We use policies and procedures as guides to resolving requests or complaints, not as excuses for saying "no."
- We try to provide the entire service as soon as possible; at a minimum, we provide a concrete result within 24 hours.
- We always address customers with dignity, respect, and calm.
- Whatever you do, do not be the source of any customer complaint.

- We acknowledge and reward superior customer service in ways that matter to our employees and managers.

Agreement also exists that top managers play a crucial role in making customer service an important organizational value. Organizational values usually face competing challenges from other values, such as being responsive to elected officials, getting along with others in the organization (not rocking the boat), and respecting rules and policies. One role of top management is to clarify the importance of customer service, for example, "our customers vote for our elected officials, who are our bosses," in relationship to other competing values. When customer service is made an important priority, top management will also have to resolve, or provide a process for resolving, various issues that come up as staff attempt to achieve customer service, such as unclear or contradictory rules or agency practices. Top managers need to be consistent in these clarifications and in their support for others who deal with these clarifications.

Another role is ensuring that specific customer service values are ingrained throughout the organization. Broad-scale commitment is necessary, because customers come in contact with a broad number of employees. Also, employees often depend on other employees to satisfy the needs of "their" customers, thus, all employees must work in concert to achieve customer satisfaction. The job of top management is to ensure that organizational values relating to customer service are driven deep into every nook and cranny of the organization, affecting the actions and thought processes from the highest managers to the lowest-ranking employee. To this end, top management must ensure that the structure of rewards and expectations promotes its values with regard to customer service. Typically, middle managers and supervisors become accountable for ensuring that these values receive broad-scale support in their units. Training is usually part of instilling these values at lower levels (see further). Managers can also be asked to lead by example. Continuing top management support appears to be critical, even after work groups have embraced it. In short, top management plays an important role in shaping customer service actions of organizational members.

CHALLENGES TO ACHIEVING CUSTOMER SERVICE IN THE PUBLIC SECTOR

Organizations that begin on the path toward improved customer service often face a number of issues. An important top management task is to acknowledge these issues and to assist in clarifying them for others.

First, many authors have noted differences between private and public sector “customers.” Individuals often wear different hats as they interact with governments. Citizens expect something different from government than only easy access to its services, and these different roles are sometimes seemingly at odds: for example, as citizens, many residents value speed limit enforcement in their neighborhoods, but as motorists, they might not value enforcement. Public organizations must acknowledge these different roles and accommodate the differences or assist others such as elected officials in doing so.^[2] Also, the fact that individuals play different roles does not preclude improvement in their interactions with public agencies.

Second, in some public organizations, customers are involuntary, such as regulated businesses, taxpayers, and inmates. The paradox is presented that it may be impossible for regulators to satisfy the regulated, when their requests are denied, and actions are monitored. According to Bruce McClendon,^[3] surveys show that customer satisfaction has little to do with whether a request is approved; it is more strongly affected by whether employees are knowledgeable, respectful, and creative in finding solutions, and whether services are accessible, accurate, consistent, timely, and dependable. Explanations need to be given for how and why requests are granted or denied. The physical appearance of service areas is also a factor. It seems reasonable that inmates might be approached in a similar way; for example, they might be told why a request cannot be immediately granted.

Third, customer service is consistent with orientations toward empowerment, sometimes more than is customary in some organizations. It is obvious that “one size does not fit all,” thus employees will need to use a little ingenuity in dealing with customer requests. Empowerment means holding employees and managers accountable for results; rather than using rules and regulations to stipulate how service is to be provided, agencies may do better by providing a few stipulations as to what cannot be done (or which may require supervisory review), and a mix of general principles that aid in providing a high level of customer service. This approach gives employees considerable latitude in meeting customer needs, but it also implies the possibility of inappropriate actions that might be taken. How managers specify the latitude and responsibility of employees, and how they deal with customer service failures (for example, through punishment or as learning opportunity) greatly shapes employee orientations toward customer service efforts.

Fourth, customer service requires attention to resources and rewards. It is sometimes alleged that public agencies have inadequate resources for training and insufficient flexibility for monetary rewards that might shape behavior. Rather, the resources required

for training are quite minimal, though they are higher when investments are made in information technology as well. Reinforcement of employee and manager customer service behavior need not involve (many) monetary resources. A consensus exists that monetary rewards matter less in shaping behavior than immediate and consistent feedback; public acknowledgement (for example, in staff meetings) for tasks well done can be provided. In addition, formal approaches may be considered, such as incorporating customer service criteria in performance appraisal criteria, though these are seldom sufficient in the absence of informal approaches to instill and maintain strong customer service values.

CUSTOMER SERVICE TRAINING

Employees need to be told what actions are expected of them. Thus, training is usually part of an effort to increase customer service. Training usually begins with identifying the need for customer service, assessing current customer service outcomes and practices, specific organizational values and practices, applications to specific situations relevant to employees, and formulating an implementation or follow-up plan that discusses how change will be monitored, improved, and rewarded. Customer service training involves basic principles as well as advanced applications.

The basic principles of customer service are that it is about achieving real results for customers and the organization; it involves more than a slogan or merely putting on a friendly smile, although the latter may be part of the improvement. Customer service is attitude and expected behaviors that should always be present. The above values clarify specific attitudes and expectations that may be expected of employees. They involve matters of direct interaction (for example, how phone calls are transferred), as well as willingness to change the way that services are provided (for example, electronic acceptance of applications, whereas previously, only in-person or hard copy applications were accepted).

The basic principles include a four-step process of personal interactions with customers: open, interact, ask for an expression of satisfaction, and conclude. Examples in role playing are provided that help staff develop ways of dealing with customers that have a wide range of conditions, such those that are indecisive, irate, overly insistent, angry, violent, as well as those that are within a normal comfort zone in dealing with public agency personnel. These applications should be relevant to the actual jobs of employees. Basic training sometimes also includes a site visit or film of an organization that is known for excellence in customer service.

Advanced training involves the steps for creating customer service teams in departments, which are tasked with recommendations for improving customer satisfaction, and implementing specific proposals.^[4] Training involves a range of practical steps that such teams should take, as well as challenges that may stem from resistance or apathy. Advanced training also involves the development and use of a customer satisfaction survey. Although they are increasingly used, voluntary surveys are distinguished from systematic (or scientific) surveys. Voluntary customer surveys are completed at the initiative of the customer; although they are not generalizable to all customers, they do provide an early warning signal to managers about problems that may need to be addressed. Scientific surveys use a representative sample of customers; such surveys are generalizable, and are used for benchmarking customer service satisfaction.

MEASURING CUSTOMER SERVICE OUTCOMES

Organizations are increasingly measuring the level of their customer service:^[5]

1. Customer and citizen surveys are used to measure perceptions of customer service and program outcomes.
2. Objective measures, such as performance measures, are used track performance in areas relevant to customers.
3. Trained observers are used to observe conditions against customer service standards.
4. Other methods, such as tracking customer complaints or compliments or conducting focus groups, are also used.

Scientific surveys are increasingly used in public administration to obtain the perceptions of a representative sample of citizens or program clients. Such surveys typically include such questions as “Have you had contact with any (our office) employees during the last 12 months?,” and, if yes, “Thinking about your recent experiences with _____, please tell me whether you strongly agree, agree, disagree or strongly disagree with the following statements:”

- The employees were helpful.
- The employees treated me with respect.
- The employees were friendly.
- The service was provided without mistakes.
- The service was provided in a timely manner.
- The service experience exceeded my expectations.

Responses to such items help assess average customer satisfaction. In many cities and counties, it

may be found that more than half of residents have had some contact with an official from the jurisdiction, that most residents have only one or two interactions, and that the perceived level of customer service during those interactions significantly affects overall perceptions of the jurisdiction. It thus follows that customer service is of great importance. Of course, surveys are also used to assess perceptions about the overall functioning of programs and policies.

Systematic surveys are not usually designed to provide much insight into the reasons for high or low levels of customer satisfaction; they usually only provide a valid snapshot of the current performance. Focus groups and customer comment cards can shine light on the causes of customer satisfaction. Customers can identify specific program features that are irritants to them, hence, suggesting or implying alternative courses of action for improvement. Although these source of information are not generalizable, they stimulate insight and, hence, possible action.

Performance measurement is increasingly used and often involves collecting objective data about program activities and outputs. For example, an emergency response program might measure the number of calls acted on within the first 2 minutes of receipt, the average time it takes for a response team to appear at location, the percentage of response teams that show up exceeding a standard time, the number of dispatched teams that did not involve emergency, and so on. Many of these administrative data are related to customer satisfaction, and continuous improvement is likely to affect customer satisfaction.

Trained observers are not always widely used, but they, too, can help assess customer service outcomes. For example, parks programs often used trained observers to rate the appearance of their facilities in ways that are relevant to customer satisfaction. Role playing is also used to assess customer interactions, such as at service request counters, toll booths, and telephone response centers.

DESIGNING PROGRAMS AND SERVICES WITH THE CUSTOMER IN MIND: SOME EXAMPLES

In recent years, public organizations have found many ways to improve customer satisfaction. In most instances, this involved redesigning the ways in which services are delivered, as well as the manner in which customers and citizens are addressed. Even basic operations such as answering citizen requests are redesigned. In many agencies, a standard is now set that calls are answered on or before the fourth ring, and that a “warm” hand-off is used when transferring calls; no longer are callers transferred to voice mail

boxes. Standards are also set for resolving caller queries, such as immediately or within 24 hours for most calls. Fairfax County, VA has implemented software that tracks the status of citizen requests.

Agencies have also redesigned their services to better meet the needs of citizens, often through information technology. Sometimes, this has required rethinking of the business that they are in. For example, the U.S. Internal Revenue Service (IRS) has reshaped itself from an agency that only attempts to maximize revenue to one that now aims to ensure that citizens pay the correct amount of taxes; taxpayers can call the IRS for advice on ways to reduce their tax burden. The IRS has also improved the way it deals with tax refunds. To satisfy its customers, the IRS has an electronic system, whereby taxpayers call to learn whether their Income Tax Returns have been received, when they will be processed, and when a check has been issued for any refund that is claimed.

Transportation agencies have also increased their customer orientation. The Orlando-Orange County Expressway Authority operates over 80 miles of toll roads in Orange County (Florida). It was among the first of such agencies to use an electronic system for collecting tolls, thus reducing traffic backups at toll booths during rush hour and allowing users of the electronic to drive through toll booths without stopping. This saves users many minutes in their commute. It is now considering expanding the use of its electronic payment device for such alternative uses as parking. Other agencies are also inquiring about the feasibility

of providing users with real-time updates of traffic situations and alternative routing.

Many jurisdictions are now investing in their Internet web site to improve their delivery of services. On many sites, citizens are now able to download a wide range of forms that they might need, such as for regulatory inspections or enrollment. They are also able to electronically submit these forms, through e-mail or by on-line completion of them. Governments are also beginning to use their Internet sites for e-commerce, such as for paying parking fines or providing user fees for services. They are also able to order government products on-line, such as special reports and T-shirts and mugs. In short, agencies are increasingly rethinking how they can satisfy and exceed the expectations of citizens, through what they do and how they do it.

Data Integrity

Theo Edwin Maloy

*Department of History and Political Science, West Texas A&M University,
Canyon, Texas, U.S.A.*

INTRODUCTION

Data integrity is the assurance that information can only be accessed or modified by those authorized to do so. Integrity measures include controlling the physical environment of networked terminals and servers, restricting access to data, and maintaining rigorous authentication practices. Data integrity can also be threatened by environmental hazards, such as heat, dust, and electrical surges.

Physical measures to protect data integrity include making servers accessible only to network administrators; keeping transmission media, including cables and connectors, covered and protected to ensure that they cannot be tapped; and protecting hardware and storage media from power surges, electrostatic discharges, and magnetism.

Network administration measures to ensure data integrity include maintaining current authorization levels for all users; documenting system administration procedures, parameters, and maintenance activities; and creating disaster recovery plans for power outages, server failure, and virus attacks.^[1]

magnetism. There should be an uninterruptible power supply attached to the server.

- Combustible materials should not be stored near network equipment, and fire and smoke detectors should be installed near network equipment. Carbon dioxide fire extinguishers should be located near network equipment.
- Power cords should be covered to ensure they are not a hazard. Cables and connectors should be installed in accordance with organization standards and the National Electrical Code and the National Fire Protection Code.
- Sensitive, confidential, or critical documentation, files, and software should be stored in a fireproof safe when not in use.
- Interconnection device access should be disabled after hours.

NETWORK OPERATING SYSTEMS

Access to network operating system software, files, and commands should be controlled and appropriately restricted:

- Each node attached to the network should be uniquely identified.
- The network should provide the ability to log and to audit network activity when a security threat has been identified.
- The network should provide the ability to produce reports on network utilization and on audited events.
- Access privileges granted to read, modify, create, and delete files should be limited to only what is necessary. Data should be available only to users authorized to access that data.
- Access privileges granted to execute only, read, update, create, and delete programs and applications should be limited to only what is necessary. Access to utility programs should be controlled, and their use should be monitored. Each authorized user should be uniquely identified.
- The network should authenticate by password each authorized user. Users should be able to change their passwords and should be required to change their passwords at a predefined interval. Passwords

PHYSICAL AND ENVIRONMENTAL SECURITY

Alternative processing methods for critical functions should be available in case local area network services are disrupted for extended periods:

- Servers should be located in a physically secure area accessible only to the network administrators.
- Where every workstation may be used as a server, all devices should be under supervision when in use and should be physically secured when not in use.
- Transmission media should be covered and protected to ensure unauthorized personnel or devices cannot tap them. Transmission media should be physically secured in conduits, trenches, or ducts to prevent electronic eavesdropping.
- Hardware and storage media should be protected from excessive dust, dirt, heat, and moisture. Hardware and storage media should be protected from power surges, electrostatic discharges, and

associated with special privileges, such as the administrator's login, should be changed more frequently. Passwords should not be displayed and should be passed on the network in a secure format. A specific number of unsuccessful login attempts should result in the suspension of the login ID.

- Users should be automatically logged out or the workstation should be locked after a period of non-use to prevent unauthorized access.
- Access to data or files classified as sensitive, confidential, or critical should be controlled appropriate to their classification. All sensitive data transmitted over the network should be encrypted if encryption is available.
- An audit trail of all station additions and deletions should be maintained.
- For authorized personnel, security tables and files should be easy to maintain. Additions and changes to the security tables and files should be effective immediately.
- The software should provide the ability to delegate administration of some functions and some users in such a way that the subadministrator can be assigned responsibility for those portions of the security tables and files that directly affect his or her organizational unit.
- Adequate network administration resources, including manuals and vendor support, should be available.

DATA AND SOFTWARE BACKUP

Regular backups of production software should be performed, with backup devices kept in a secured location, protected from environmental hazards and unauthorized use. Periodic backup copies of the entire system should be made, as well as selected backup copies of specific files as needed. Backup procedures should be documented, and external labels should be used to identify the contents of backups. Data sensitivity and security should be monitored during recovery from a backup and should be reinstated once recovery is complete. Alternative processing methods for critical functions should be available in case local area network services are disrupted for extended periods.

NETWORK ADMINISTRATION

Managers and supervisors within the departments using the local area network should understand the importance of security, and should communicate that importance to departmental personnel:

- Network administrators should be trained, and a backup administrator should be identified.

- Access privileges for transferred or terminated employees or employees on leave should be reviewed and adjusted.
- Network administration functions should be limited to specific users and to specific network nodes.
- A current inventory of workstation and file server hardware and software should be maintained.
- Users should be aware of the license and contract restrictions that affect their use of the local area network. Copyrighted software and documentation should not be copied, and concurrent access to single-user software should not be allowed on the local area network.
- Users should be informed about their responsibilities for equipment, software, data security, and copyrighted material.
- Requests to develop or change programs and files should be approved by authorized personnel.
- Adequate documentation of system administration procedures, parameters, and maintenance activities should be maintained.
- Contact information should be available for vendors or others who have agreed to provide network maintenance.
- A disaster recovery plan should be in place that lists symptoms, possible causes, preventative measures, and recovery steps for power outages, server failures, tape backup unit failures, application software failures, network operating system upgrade failures, cabling failures, client failures, and virus attacks.
- Procedures should be in place to ensure that all modifications to routing tables and translator tables are properly authorized, that such changes are made only by authorized personnel, that changes are tested prior to implementation, and that an adequate audit trail exists to document all modifications.
- Procedures for changing or updating existing programs and files should be established and maintained. Vendor-supplied software changes and updates should be tested, installed, and distributed where appropriate.
- Users should be informed of changes such as new versions of software changes and the effects of those changes, and users should be informed about any restrictions on using hardware and software for personal use.

COMMUNICATION CONTROLS

Access to interconnection devices including gateway servers, routers, and bridges, should be limited to authorized users. Monitoring systems should be in place to detect unauthorized access attempts. Interconnection device access should terminate

automatically if unauthorized use is detected and should be disabled after hours. Access to the communication devices' configuration files and tables should be restricted to authorized network administrators.^[2]

PUBLIC ADMINISTRATORS' SPECIAL CONSIDERATIONS

Governmental agencies and private organizations that use public agencies' data must assure their customers, including individuals, firms, and other governmental entities, that the confidentiality and privacy of information they electronically collect, maintain, use, or transmit is secure. Information security is especially important when information can be directly linked to an individual or firm. Confidentiality is threatened not only by the risk of improper access to electronically stored information but also by the risk of interception during electronic transmission of the information.

Many government records require access signatures, but there is no national standard for security or electronic signatures. Each governmental entity must define its own security requirements. To satisfy the legal characteristics of a written signature, an electronic signature must identify the signatory individual, assure the integrity of a document's content, and provide strong and substantial evidence that will make it difficult for the signer to claim that the electronic representation is not valid.

Public Administrators should establish data integrity standards that conform to these generally desirable principles:

1. Improve system efficiency and effectiveness by leading to cost reductions or improvement of service from electronic transactions.
2. Meet the needs of the user community, particularly individuals, firms, and other governmental agencies.
3. Be consistent and uniform with other private and public sector data standards, including data element definitions and codes and their privacy and security requirements.
4. Have low additional development and implementation costs relative to the benefits of using the standard.
5. Be supported by an American National Standards Institute-accredited standards-developing organization or other private or public organization that will ensure continuity and efficient updating of the standard over time.
6. Have timely development, testing, implementation, and updating procedures to achieve administrative simplification benefits faster.

7. Be technologically independent of the computer platforms and transmission protocols used in electronic health transactions, except when they are explicitly part of the standard.
8. Be precise and unambiguous but as simple as possible.
9. Keep data collection and paperwork burdens on users as low as is feasible.
10. Incorporate flexibility to adapt more easily to changes in the infrastructure (including new services, organizations, and provider types) and information technology.

A master data dictionary providing for common data definitions should be developed and maintained. Data element definitions should be precise, unambiguous, and consistently applied. The transaction-specific reports and general reports from the master data dictionary should be readily available to the public. At a minimum, information presented will include data element names, definitions, and appropriate references to the transactions where they are used.

Security Standards

A security standard is a set of requirements with implementation features that individuals, firms, and governmental agencies must include in their operations to assure that electronic information remains secure. The standard need not address the extent to which a particular entity should implement the specific features. Each affected entity should assess its own security needs and risks and devise, implement, and maintain appropriate security to address its requirements. These measures must be documented and kept current.

There is no recognized single standard that integrates all the components of security (administrative procedures, physical safeguards, technical security services, and technical mechanisms) that must be in place to preserve information confidentiality and privacy as defined in the law. There are numerous security guidelines and standards in existence today, focusing on the different techniques available for implementing the various aspects of security.

There are several concepts on which a standard should be based:

1. The standard must be comprehensive. A standard must address all aspects of security in a concerted fashion.
2. The standard must be technology neutral. Because security technology is changing quickly, there should be flexibility in choosing technical solutions. A standard dependent on a

specific technology or technologies would not be flexible enough for future advances.

3. The standard must be scalable. The standard must be implemented by all the affected entities, from the smallest firm to the largest government agency. A single-sized approach would be neither economically feasible nor effective in safeguarding data.^[3]

Outsourcing and Privatization

Insourcing and outsourcing, usually called privatization in the public sector, describe a multitude of information technology options available in the marketplace. Total outsourcing is the decision to transfer assets, leases, staff, and management responsibility for information technology service delivery to a single third-party vendor that represents more than 80% of the information technology budget. Total insourcing is the decision to retain management and provision of more than 80% of the information technology budget internally. Selective sourcing is the decision to source selected information technology functions from external providers while providing between 20 and 80% of the information technology budget internally.

General outsourcing can be divided into selective, value-added, and cooperative outsourcing. Selective outsourcing is when one area of information technology, such as data center operations, is chosen to be turned over to a third party. Value-added outsourcing is when an area of information technology activity is turned over to a third party thought to be able to provide a level of support or service that adds value to the activity that could not be cost-effectively provided by the internal information technology group. Cooperative outsourcing is when a third-party provider, public or private, jointly performs some targeted information technology activities with the internal information technology department.

Information technology research has produced three major findings:

1. Conflicting stakeholder expectations place information technology managers in the precarious position of providing Rolls Royce service at a Chevrolet price. In general, senior management perceives the entire information technology function as a utility, and therefore, sets the information technology agenda to be cost minimization. Agencies and end users perceive that information technology critically contributes to operations, and therefore, sets the information technology agenda to be service excellence. Information technology managers are frustrated, because senior managers and

users set conflicting agendas for information technology, expecting information technology managers to deliver Rolls Royce service at a Chevrolet price.

2. The published literature portrays an overly optimistic view of information technology outsourcing. The optimism exists, because reports are made during the honeymoon period when clients first sign an outsourcing contract, and clients and vendors possess high outsourcing expectations. Second, the literature only reports projected savings, not actual savings. Third, public reports underrepresent outsourcing failures, because few managers wish to advertise a mistake. Therefore, the literature misrepresents the spectrum of outsourcing experiences by focusing on the success stories.
3. Organizational members initiated outsourcing evaluations for a variety of reasons. Financial reasons included cutting costs, improving cost controls, and restructuring the information technology budget. Business reasons included returning to core competencies and devolving organizational and management structures. Technical reasons included improving technical services, gaining access to new technical talent, providing access to new technologies, and focusing the internal information technology staff on core technical activities. Political reasons included reacting to the efficiency imperative, acquiring or justifying additional resources, reacting to the positive outsourcing media reports, reducing uncertainty, eliminating a burdensome function, and enhancing personal credibility.
4. Successful sourcing evaluations compared vendor bids against a newly submitted internal bid, not against current information technology performance. When vendors submit bids that indicate savings, managers must question how the vendor proposes to reduce costs and not just attribute savings to economies of scale. In many cases, vendor bids were based on efficient managerial practices such as standardization, consolidation, centralization, and tighter controls—practices that internal information technology managers may be able to replicate if empowered to do so. Implementing cost savings measures required information technology managers to adopt policies that may not be readily agreed to by the agency units or by the agency's clientele.
5. Internal information technology departments possess superior cost advantages from some information technology cost drivers. Outsourcing vendors have an inherent data center

operating cost advantage over small information technology departments, but they are comparable to large information technology departments. Internal information technology departments have comparable hardware purchase volume discounts with outsourcing vendors, but small departments have an inherent disadvantage. Internal information technology departments and outsourcing vendors have comparable software licensing costs. Internal departments have inherent advantages on agency expertise and organizational, marketing, and transaction costs. Outsourcing vendors have inherent advantages on technical expertise, research and development, and opportunity costs.

6. When managers decide to outsource, detailed contracts are more likely to be successful than relational contracts. Vendors are not partners unless profit motives are shared, and the profit motive is not prominent in the public sector. Many public and non-profit organizations used vendors to satisfy their information technology needs for hardware and software upgrades, installation and maintenance of area networks, staff training, expert solutions, data management of payroll and accounting, and general consultation about technology and available options. Many governments have learned that the small software firms lack the staying power to improve upon or even support their products beyond the first few years. These problems show that choosing a vendor and consultant must be done carefully and with objectivity. Choosing a

vendor begins with a needs assessment that should be based on multiple users and experts.

System maintenance contracts require great detail with regard to software development and enhancement, purchasing procedures, the expertise of service personnel, staff training, and responsibilities with regard to system reliability and security. Access, data integrity, and the protection of information assets are important, because public and non-profit organizations increasingly rely on their information systems for operations and decision making, and because information technology systems are increasingly subject to the threat of viruses, hackers, and sabotage.^[4] Outsourcing vendors and information technology suppliers compound the data integrity issues and vulnerabilities, especially when hardware or software is removed from the public administrator's or the agency's control.

Data Mining as a Decision-Making Aid

William J. Mead

Consultant, White Plains, New York, U.S.A.

INTRODUCTION

Data mining (DM) is a relatively new concept by which it has become possible and feasible to dig through huge collections of data looking for previously unrecognized trends or patterns. The resulting information can potentially be highly useful. The name is a clever takeoff on mining for precious metals or gems, where it is necessary to laboriously plow through masses of rubble to find a few pieces of material of great value.

Data mining is also called “knowledge discovery in databases,” although some workers in this field draw slight distinctions between this and data mining. The definitions have not been standardized or universally agreed upon.

Most organizations, such as government agencies, commercial and industrial businesses, health care facilities, educational institutions, etc., generate large volumes of data in the course of conducting day-to-day operations. These data come from a variety of sources, examples of which include the following: in business situations, from order processing, inventory control, production planning and billing; in financial institutions, from customer account transactions; in the telecommunications industry, from keeping track of billions of phone calls and Internet connections for billing purposes; in health care, for patient records and responses to medications and procedures; in educational institutions, for student records; in government, from such things as tax receipts and expenditures, and the activities in various agencies.

For many years, computer mainframes and personal computers have been grinding out data, much of which has gone to inactive storage. But, within the past decade, it has been realized that by going back and carefully studying these banks of data, interesting and useful knowledge can sometimes be obtained. Software has been developed for this specific application, and many stunning successes have been reported. This has resulted in the evolutionary development and commercialization of more sophisticated data mining tools using applications of statistical analysis, modeling, artificial intelligence, and neural networks. As favorable results were made known, many agencies, firms, and institutions picked up interest in the

concept, and more software firms became involved in developing improved data mining tools. It is said that there are now more than 100 firms offering such software, consulting, and seminars.^[1]

As pointed out by Simon,^[2] data mining is a highly useful technique to use to help gain deeper insight into the overall picture and general trends described by the data. However, these methods can also uncover patterns that have no real-world meaning or use, so human judgment remains a critical factor. This is sometimes overlooked in the glowing reports of successes with data mining—it is indeed a good tool but not necessarily a panacea.

THE APPLICATION OF DATA MINING TO DECISION-MAKING

As mentioned by Cratochvil,^[3] the whole point of data mining is to reveal hidden information as an aid for prompt and effective decision-making. Action results from the knowledge obtained through the data mining process by discovering non-obvious patterns in existing collections of data. This process is a tool that can be of immense importance to decision makers.

In public administration, data mining or knowledge discovery can be helpful to aid auditors in detecting faulty tax returns, by establishing efficient profiles of non-compliant taxpayers by using models created from historical information. This can help identify the tax returns worth investigating, out of the millions filed. This has proven far more efficient than the previous somewhat hit-and-miss techniques of selecting the returns to be audited.^[4]

In some instances, the operation of court systems has been improved by “mining” the profiles of potential jurors. Similarly, data mining has proved useful in helping establish the relative toxicity of chemicals released into the air, and in predicting the effectiveness of new drugs and medical tests, both of which have obvious regulatory applications.

Data mining is useful also in isolating the factors involved with fraud and abuse in social assistance programs, Medicare and Medicaid, and procurement. Digging into historical records to detect patterns can

prove far more efficient in controlling fraud and recouping money than the previously used human intuition methods of approaching these topics.^[5]

Government departments and agencies can use data mining techniques to help determine how well programs under their jurisdiction are really performing. Law enforcement agencies have made effective use of data mining to find patterns and trends in crime, to help resolve open cases, to target repeat offenders, and to take steps to help prevent crimes. Data mining is also useful in analyzing and predicting traffic flows and growth. These techniques can also be used to help assure that government programs and services are more accessible to the public, and to develop and monitor programs to help meet the needs of stakeholders in the communities served. These are merely a few examples of the potential usefulness of data mining in public management.

There are interesting uses of data mining in commerce and industry, such as determining buying habits of consumers, tracking the effectiveness of advertising, credit risk assessment, and many others. One application that many of us have encountered is the ability of credit card companies, and telephone companies, to detect unusual activity on a specific account, which enables them to quickly contact the holder of the card in question to see if the use was really authorized or if the card had been misappropriated.

DATA WAREHOUSING

Most information systems are designed to facilitate day-to-day operations. However, as pointed out by Gupta,^[6] it is impractical to keep data in operational systems indefinitely. Moreover, the sheer volume of data generated by organizations and agencies makes it difficult at best to effectively extract, analyze, and identify previously unrecognized relationships and trends in historical information. Operational databases usually are not designed for long-term storage of data, or for easy access for queries. As a result, it is now common practice to transfer consistent, cleaned, organized data from operational systems into special archives called data warehouses designed and maintained for historical queries and for data mining.

Straightforward answers to simple or complex questions can often be obtained from archived data through the employment of what are called query tools, the most conventional of which is called structured query language (SQL). This is defined in American National Standard ANSI X3-135-1992 entitled *Database Language SQL*, and the international standard ISO/IEC 9075:1992 entitled *Information Technology-Database Languages-SQL*.^[7,8] A query

defines a set of rules to find the desired information. SQL is a way to communicate directly with a database. The user can specify the type of information that is wanted and can also control which set or sets of data that are to be accessed. Moreover, through SQL, the database can be modified by adding or deleting records, or by creating or modifying tables or other views of information contained within the database.

Beyond the types of questions for which SQL is useful, data warehouses also allow more sophisticated techniques to find otherwise hidden knowledge and patterns through data mining. Query tools and data mining tools are complementary, both employed to extract useful information from archives of historical data but in different ways for different purposes.

Data warehouses can be fed not only from the output of mainframe computers but also from files and spreadsheets generated on desktop and laptop personal computers. Obviously, the design of the data warehouse must take into account the sources of input and the ways the stored information is likely to be used. A variety of hardware and software exists for building, maintaining, managing, and using data warehouses. Also, a wealth of literature exists on data warehousing.^a

According to Siegel,^[14] making data warehousing integral to an organization's daily operational fabric tends to be far more difficult than designing and building the system. Effective data warehousing requires a considerable amount of training on the part of all involved.

In summary, data warehouses serve two goals, one of decision support through ready access to historical information via query tools, and the other the possibility of recognizing otherwise hidden patterns and trends in the accumulated data via data mining.

ONLINE ANALYTICAL PROCESSING (OLAP)

One of the several tools used in data mining is termed on-line analytical processing (OLAP). OLAP is a category of software that permits the use of "multidimensional" databases, i.e., it permits a wide variety of ways of looking at accumulated data to help give meaning and reduce confusion. For example, the dimensions might be time, location, the weather at various points in time, who was on duty, or other such factors that might be significant. OLAP facilitates navigating through large and complex databases. A spreadsheet is considered to be two dimensional, having rows and columns. However, more complicated scenarios

^aExamples of books on data warehousing include Refs.^[9-13].

of data can be considered as cubes composed of cells of information. In the language of OLAP, it is possible to view “cubic” data in many ways, by “drilling down” from higher to lower levels, by “slice and dice” techniques, by pivoting or rotating the cube, etc. These methods of viewing historical accumulated data enable complex queries involving multiple but interacting variables, for effective decision support.^[15] Similarly, OLAP allows decision-makers to ask “What if” questions of the data. There are many vendors of software for variations on the OLAP theme, all of which enable great flexibility in complex analysis of information stored in data warehouses.

VISUAL DATA MINING

It has long been known that seeing data graphically presented allows better and faster comprehension than looking at rows and columns of numbers. Tufte^[16] said that graphical presentations were used long before the advent of computers, dating back to the 1700s, when statistical graphics and Cartesian coordinates were originated. Such graphics as scatterplots, histograms, time-series charts, bar charts, line graphs, pie charts, Pareto charts, boxplots, control charts, and many other versions of two-dimensional representations of data have been and continue to be used to get away from what many consider to be boring tabular presentations. Many of these presentations are easy to achieve on computers. Data maps have also been used extensively for powerful presentation of facts.

The way the data are presented can impact the ease with which decisions are made. At the same time, however, graphical presentations can deliberately or inadvertently mislead the decision maker through deceptive distortions of scale and other visual tricks.

The use of color can make graphical presentations more interesting and can focus attention on important features. Color can also be used to emphasize a point or to identify recurring themes.

One of the major purposes of data mining is to detect unexpected trends and relationships. The human eye and brain are excellent at recognizing patterns, so the use of graphics with data mining is an entirely logical step. As pointed out by Thearling,^[17] useful relationships between variables that are non-intuitive are the jewels data mining hopes to locate, and visualization techniques can greatly aid this process.

Visualizing the data mining models is also a good way to help the decision maker understand and trust the complex models involved. Within the past few years, software developers have come up with many approaches to showing the results of data mining in interesting and helpful graphic presentations. Some of

these tools enable the user to manipulate the variables to better demonstrate the concepts under consideration. Lawler^[18] added that not only can complex patterns be easily spotted, but also, an aesthetically pleasing image can help spark the creativity and curiosity of viewers otherwise unmoved by simply seeing pages of numbers. In addition, visual data can help stimulate discussions and communication between individuals and groups, which can even help bridge gaps when people from different disciplines or different parts of an organization are jointly involved in decision making and problem solving.

In some instances, vivid three-dimensional images of data mining results are possible, yielding a virtual-reality environment. As Eliot^[19] said, visualization presents the data landscape in a natural and intuitive form, making full use of the human capacity to absorb and interact with complex images.

CONCLUSION

Due to the incredible increase in computing power and the accumulation of large quantities of data over recent years, combined with the development of specialized software making data mining feasible, this has become an evolving tool for decision support that has great possibilities in a number of different types of applications. However, data mining requires establishing a well-designed “data warehouse,” which is time consuming and costly to properly set up and maintain. Moreover, because human involvement is required in the interpretation of what is unearthed, considerable training and experience is needed. The successes of data mining are sometimes overstated and exaggerated, making it difficult to determine whether (in any specific circumstances) it is truly worth the effort and the money. But, the possible benefits can indeed be real, making this a topic worthy of careful consideration.

INTRODUCTION

Municipal bonds are an important way that state and local governments finance their infrastructure improvements. An understanding of how much the government can afford to pay for debt and how much debt it can safely carry is a crucial element in capital and debt planning. The purpose of this article is to describe and analyze the different ways that local governments can measure how much debt they can afford.

BACKGROUND

Debt affordability assessments are intertwined with capital improvement programs (CIP) and debt policy formulation. A CIP is a financial plan that includes an analysis, prioritization, implementation, and financing of infrastructure and other capital needs. The CIP is a multiyear plan that prioritizes and identifies capital projects (as compared to the capital budget, which is the annual spending plan). Governments may have multiple CIPs, each with a different time horizon. The CIP “provides for an orderly and routine method of planning and financing a government’s required capital improvements.”^[1] Borrowing via the municipal bond market is the primary form of capital financing, and planning for it is a key ingredient to a CIP.

Municipal borrowings are generally called municipal bonds, even though some are not technically bonds (e.g., certificates of participation). Municipal bonds are often retired over 15, 20, or even 30 years. The municipal market is very large, with from \$300 billion to \$400 billion sold each year. With this much debt, even small interest rates savings can have a substantial financial impact. The potential financial impact on future generations adds salience to municipal debt decisions. Therefore, debt policies that provide a set of guiding

principles for management decision making are important to the CIP. The Government Finance Officers Association (GFOA) and others have espoused the use of debt policies as an important management tool for state and local governments.

“A carefully crafted debt policy can enhance a government’s credit quality and improve access to both taxable and tax-exempt credit markets.”^[2] Debt policies include such items as when to use a request for proposals; the appropriate conditions for competitive or negotiated sales; proper disclosure procedures; and including citizens in the decision process through public meetings, a vote, or other means, etc.

Larkin and Joseph^[2] advocated that a government’s debt policy should begin with a comprehensive review of affordability. As Larkin and Joseph pointed out, just as when homebuyers make a selection on which home they want based on how much they can afford on a monthly basis, governments need to have a good understanding of debt affordability prior to forecasting needs and issuance. Debt affordability analysis is conducted by calculating a series of ratios and comparing them with established standards that provide guidance about the amount of debt the government can afford. Fig. 1 shows how the CIP, the debt policy, and the debt affordability analysis relate: a debt policy is an important part of a CIP, while debt affordability analysis is an important part of a debt policy.

Debt Affordability and Municipal Credit Analysis

Debt affordability analysis is closely related to the municipal credit analysis conducted by bond-rating agencies. Bond-rating agencies seek to determine the riskiness of the debt based upon a government’s ability to call forth and manage their resources, while governments need to understand how much debt they can comfortably issue. The bond-rating agencies assess

Fig. 1 The relationship between capital improvement programs, debt policies, and debt affordability analysis.

the following four factors to determine credit quality of municipal tax-backed debt:

- *Economy.* Analysis of economic factors consists of an examination of the current and projected future economic profile. This includes analysis of the breadth and depth of the local economy. Measures include trends in unemployment rates; business diversification and industry concentration; trends in the issuance of building permits; and the mix of residential, commercial, and industrial property. Demographic trends such as population growth or decline are also examined. In addition, wealth indicators are analyzed, such as per capita or personal income trends, property value per capita, percent below poverty level, and household income.
- *Financial Condition.* A key to the analysis of fiscal condition is the flexibility of the financial environment. Are revenues limited? What percent of expenditures is mandated or otherwise fixed? Are tax rate adjustments implemented as needed, or do rate increases tend to be traumatic events that are only implemented after reaching crisis conditions? Some broad factors indicative of financial condition are compliance with generally accepted accounting principles (GAAP); diversity and stability of revenue sources; a trend of operating surpluses; and fund balance as a percent of revenues.
- *Debt Position.* Analysis of debt position focuses on the structure and security of the bonds in the context of future borrowing needs and the resources available to pay the current and future debt service. Analysis of debt position is key to debt affordability analysis.
- *Administrative Factors.* The rating agency, Fitch IBCA, views management as a crucial component when evaluating the creditworthiness of a community as they report having seen management salvage, as well as exacerbate, difficult financial situations. "In its future rating assignments, Fitch IBCA will place greater and more specific weight on management practices, both good and bad, that

are employed by issuers in running their financial operations."^[3] Past management performance, in balancing budgets, managing capital needs, etc., is examined. Appropriate capital improvement programs, accurate capital and operating budgets, and prudent investment policies are indicators of sound management practices.

Debt affordability is generally understood in terms of tax-supported debt. A separate type of analysis is conducted for debt backed by other forms of security. General obligation bonds, lease bonds paid from general revenues, certificates of participation, special assessment bonds, and tax-increment bonds are forms of tax-backed securities.

Measuring Debt Affordability

Three key notions comprise debt affordability analysis: 1) ratio calculation; 2) comparison to norms or standards; and 3) forecasting. We will discuss each of these notions in turn.

Ratio calculation

The GFOA recommends that "issuers undertake an analysis of their debt capacity prior to issuing bonds."^[4] The purpose of such a suggestion, according to the GFOA, is that a comprehensive and routine analysis ensures that the government will know all new debt issued is affordable, there is balance between current and future capital needs, and there is the ability to pay for them.^[4] The GFOA suggests that a comprehensive debt analysis should contain the following:

- Measures of the debt service obligation.
- Evaluation of trends relating to the government's performance (revenues, expenditures, and unreserved fund balance).
- Measures of debt burden on the community.
- Statutory or constitutional limitations on debt issuance.
- Market factors affecting tax-exempt interest costs (interest rates, market receptivity, and credit rating).^[4]

Other obligations to consider include unfunded pension liabilities and capital leases.

More specifically, typical measures of debt affordability include the following:

- *Debt service.* Debt service consists of principal and interest payments. It is usually stated in terms relative to total revenues or expenditures.

- *Direct debt (or net direct debt).* Direct debt is a measure of a municipality’s debt paid for by its general revenues including taxes. Bonds that are self-supporting by means other than taxes, such as user fees or charges, are not included in direct debt. As mentioned earlier, tax increment bonds, special assessment bonds, and certificates of participation are included in direct debt, as they are backed by taxes or general revenues.

Using these measures, a variety of ratios can be calculated to put these figures into relative, comparable, terms to other governments. Some of the common ratios are listed below:^a

- *Debt per capita.* Debt per capita is a measure of total indebtedness divided by the population. This standardizes the debt by the population size of the government—ten million dollars might be a lot of debt for Mansfield Connecticut, but a small amount for New York City.
- *Debt as a percentage of real market value.* Debt as a percentage of the real market value is derived by dividing the direct debt by the real market value of all taxable property within the jurisdiction. Because property taxes are typically a primary source of revenues, this is an important measure, as it highlights a municipality’s ability to support its current, and future, debt through the taxing of its property.
- *Debt as a percentage of personal income.* This statistic compares the debt outstanding to a measure of community wealth. This measure is limited in that personal income statistics are often unavailable for smaller jurisdictions.
- *Annual debt service as a percentage of general and debt service fund expenditures.* This measure identifies the portion of the general and debt service funds that goes to debt service.
- *Annual debt service as a percentage of operating expenditures.* This concept is broader than the last, as it includes expenditures from all operating funds, such as the general fund, special revenue funds, and debt service funds.
- *Impact of the debt on the tax rate.* This measures the portion of the tax rate that is dedicated to servicing tax-supported debt.
- *Impact of the debt on the average household.* This statistic measures the monetary burden on the average household in the community.

It is important to also include overlapping debt when calculating the principal amount outstanding. Overlapping (or sometimes underlying) debt is the

tax-supported principal owed by other governments that overlap (or underlie) the geography of the jurisdiction conducting the debt affordability analysis. For instance, if it is a city conducting the analysis, the overlapping debt would include the proportionate debt of the county, school districts, and special districts. Overlapping debt is calculated as follows:

$$OD = \frac{MV_O}{MV_T} * TD$$

where:

OD = Overlapping debt.

MV_O = Market value of the overlapping property.

MV_T = Total market property value of the overlapping government(s).

TD = Tax-supported debt outstanding for the overlapping government(s).

The notion behind overlapping debt is that the taxpayers of a jurisdiction are responsible for the debt of all their governments, not just the one conducting the debt affordability analysis. Debt as a percentage of market value that includes overlapping debt is called debt burden.

Table 1 summarizes the different statistics that typically can be used to measure debt affordability.

Comparison to norms or standards

The debt statistics and ratios are difficult to interpret on their own. Is a debt burden of 5% high, low, or

Table 1 Debt affordability statistics

Debt service
Direct debt
Debt per capita
Debt per capita including overlapping debt
Debt as a percentage of real market value
Debt as a percentage of real market value including overlapping debt (also called debt burden)
Debt as a percentage of personal income
Debt as a percentage of personal income including overlapping debt
Debt service as a percentage of general and debt service fund expenditures
Debt service as a percentage of operating expenditures
Impact of the debt on the tax rate.
Impact of the debt on the average household

^aThis section draws significantly from Ref.^[4], pp. 15–18.

moderate? Is a debt per capita of \$5000 a lot, or just a little? It helps to interpret the statistics by comparing them to some norm or standard. Examples of standards are rules of thumb, medians, and benchmarks.

Rules of thumb are industry standards for certain ratios. Some rules of thumb standards used by Standard and Poor's^[5] are as follows:

- Debt per capita (including overlapping debt) is low if it is below \$1000, moderate between \$1000 and \$2500, and high above \$2500
- Debt burden is low if less than 3%, moderate from 3 to 6%, and high if over 6%
- Debt service as a percent of operating expenditures is low if 5% or less, moderate if 10%, and high if over 15%.

Debt statistics outside of the range of the rules of thumb are not necessarily dangerous, because governments have different service responsibilities. For instance, a fire district with volunteer firefighters may have a high debt service as a percent of operating expenditures, because there are very low labor costs.

Medians can help refine government's understanding of its debt position. Medians are generally calculated by population and government type, e.g., median debt burden for counties with a population from 100,000 to 249,999. In the past, Moody's Investors Service published medians for selected debt statistics, but they no longer do so.

Another way to refine the debt affordability analysis is to compare debt statistics with those of similar governments, or benchmarks. While the use of benchmarks can provide important comparison information, there are two basic difficulties with this approach. First, no two communities are exactly alike, so the choice of comparable governments must be done carefully. Important characteristics to match when choosing comparison governments are population, revenue mix, service responsibilities, bond rating or credit quality, and whether the laws governing the use and issuance of debt are comparable.

Second, ratios are not consistently measured across organizations. Some governments deduct funds set aside for principal payment from the outstanding debt prior to calculating ratios. For instance, some governments calculate ratios based only on general obligation debt and ignore other tax-supported debt. One of the reasons for this is that state statutes or constitutions often define the way debt is to be calculated for the purpose of state debt limits. These calculations generally exclude lease debt, COPs, or any debt considered self supporting. This may be appropriate for this purpose, but provides an inadequate

and incomplete view of the debt picture for debt affordability analysis.

Forecasting future capacity

Much of the value of debt affordability analysis is to estimate how much debt a government can afford to issue into the future. Estimating debt affordability into the future requires multiyear projections for the debt statistics. This consists of forecasts of the information that are part of the ratios, along with projections of future capital needs, such as the following:

- Population.
- Operating revenues.
- Operating expenditures.
- Real market value of property.
- Personal income (if available).
- The size of the potential issues (annual dollar amounts to be issued).
- Debt maturity schedules.
- Type of debt service structure; (level debt service, equal principal, other)
- Interest rate schedule.

Different scenarios can be modeled, given different capital expenditure requirements or debt issuance structures. Constant annual growth rates applied to a base year is the way many of these parameters were estimated by Miranda and Picur^[4] for the city of Pittsburgh. Sometimes the baselines for the ratios, such as revenues, expenditures and real market value, are forecasted for other budgeting purposes.

There is uncertainty anytime projections are made. With this in mind, it is often prudent to include sensitivity analysis for varying rates of growth for the relevant factors. Once the forecasts are accomplished, the government can decide whether it can afford to pay for the debt issuance, or if the capital program needs to be scaled back. In this way, the debt affordability analysis provides important information for the government's CIP. Spreadsheet programs, such as Excel, are well suited for this future analysis.

CONCLUSION

In many ways, deciding upon debt affordability criteria is an art and not a science. Ratios can be calculated, but they need to be interpreted to be useful. Benchmarks can provide an indication of what constitutes high, or low, ratios for key debt statistics. However, because there are multiple ratios, it is possible to be low for some, but high on others. In this case, the government must decide whether that is acceptable,

or whether efforts must be made to lower the troublesome ratios.

Ratios or benchmarks alone do not tell the whole story. Other factors, such as strong economics or history of strong management, may offset high ratios. That is, a wealthy or diverse tax base and a history of sound management practices may provide a government with a better chance to withstand and recover from problems despite poor ratios.

Debt affordability analysis is an important part of a debt policy, which in turn, is an important part of a capital improvement program. Debt affordability analysis, debt policies, and capital improvement programs are an important part of any government's financial planning.

Debt Issuance

Beverly S. Bunch

*Director of Public Administration Program, PAC 324, University of Illinois at Springfield,
Springfield, Illinois, U.S.A.*

INTRODUCTION

Debt issuance occurs when a government borrows money and agrees to repay the money with interest at a later time. This practice is similar to when an individual borrows money to pay for a house and then makes monthly mortgage payments.

State and local governments borrow money for a variety of purposes. One of the major uses of debt is to finance large capital projects, such as the construction of a street, a public building, or a water treatment plant. Using debt to finance these types of projects allows the costs of the project to be spread over time rather than being paid in a single year. This can help make a project more affordable and allow the government to avoid large fluctuations in tax rates. The use of debt also helps facilitate intergenerational equity in that there is a closer match between those who use the facility over time and those who pay for the facility.

Some governments also issue debt when there is a mismatch between the timing of revenues and expenditures. For example, a government may not receive the majority of its tax revenues until the third month of the year; however, expenditures, such as payroll, will have to be made prior to that time. The government may borrow funds to pay for its expenditures and then repay the debt when the tax revenues arrive. This type of debt is referred to as tax anticipation notes (TANS) or tax and revenue anticipation notes (TRANs), if other types of revenues also are used to repay the debt.

Historically, some governments have issued debt to address a deficit situation in which revenues are less than spending. However, this practice is not considered financially prudent, because future generations have to pay for services that were provided in the past. Investors also may be reluctant to lend funds to a government that is having financial difficulties.

Governments may also issue debt to finance a loan program, such as a housing mortgage program or a student loan program. In this case, the government issues debt and then uses the money to make loans to private individuals or organizations. The government uses the funds from the loan repayments to repay the original debt.

TYPES OF DEBT

State and local government debt can be classified in a variety of ways. One form of classification is based on the length of time the debt is outstanding. Short-term debt typically refers to debt that will be repaid in one year or less, while long-term debt refers to debt that will be outstanding for a longer time period, often 20 years. Short-term debt is referred to as notes, while long-term debt is called bonds.

Another way to categorize debt is based on the security associated with debt. The most secure type of debt is general obligation debt, which is guaranteed by the full-faith-and-credit of the government. This means that investors legally can require the government to utilize its taxing authority to generate sufficient funds to repay the debt. In contrast, revenue bonds are secured solely by a specified revenue source, such as water user charges or tolls collected on a toll road. Because revenue bonds do not have the full-faith-and-credit backing of the government, they tend to have higher interest rates than general obligation bonds. However, many governments find revenue bonds attractive for the financing of projects that are expected to be self-sustaining.

Another way to classify governmental debt is by the purpose for which the bond proceeds will be used. Public purpose debt is used to finance infrastructure that will be owned by the government, such as public roads or buildings. Alternatively, a state or local government can issue private activity debt on behalf of a private organization or group of individuals who will be the primary beneficiaries from the bonds or will have primary responsibility for generating the funds to repay the bonds. Examples of private activity debt include housing mortgage revenue bonds, student loan bonds, and industrial development bonds.

Governments may issue debt to refinance existing debt. These bonds are referred to as refunding bonds, while debt issued to finance new projects is referred to as new money bonds. Similar to the refinancing of a house mortgage, a government may refinance debt when interest rates are significantly lower than when the debt was originally issued. A government also may choose to refinance debt when it wants to change some feature of the debt, such as the timing of the

principal repayments or the legal requirements associated with the debt.

TAX-EXEMPT STATUS OF DEBT

Most debt issued by state and local governments is tax exempt. This means that the interest payments made to investors are not subject to federal and, in some cases, state income taxes. As a result, investors are willing to lend funds to state and local governments at lower rates than if the interest was taxable. This feature of the federal income tax code results in significant interest savings to state and local governments.

The federal government has imposed a number of constraints to avoid abuse of the tax-exempt provision. One of the major provisions relates to restrictions on arbitrage earnings. Arbitrage is the difference between the interest rate paid on the bonds and the interest rate earned on the borrowed money until it is spent. The federal government also has imposed a state cap on the amount of tax-exempt private activity bonds that can be issued each year within each state.

Some governments issue taxable debt when they want to finance a project or program that does not satisfy the eligibility requirements for tax-exempt debt.

VOTER REFERENDUMS AND DEBT LIMITS

Most state and local government general obligation debt is subject to approval by the voters and also may be subject to some form of legal debt limitation. At the local level, the limit may be imposed by the state government or a local charter. For example, some states restrict the amount of local debt outstanding to a specified percentage (e.g., 5%) of the taxable property value within the jurisdiction. At the state level, a constitutional or statutory debt limit may restrict the amount of debt to a particular dollar amount or to a specified percentage of state revenues. Alternatively, the debt limit may indicate the maximum percentage of general revenues that can be used to repay the debt.

Revenue bonds usually are not subject to voter approval requirements or debt limitations, because they are not backed by the taxing power of the government.^[1] A special type of revenue bond, called a lease revenue bond, also is not usually subject to voter approval and debt limitations, even though the debt may ultimately be repaid with tax revenues. With this type of debt, a government utilizes a separate agency or a non-profit entity to issue bonds that are used to acquire or construct a facility to be used by the government. The facility is then leased to the government, and the agency or non-profit entity uses the lease payments to repay the bonds. The lease revenue bonds typically

include a non-appropriation clause that allows the government to terminate the lease if funds are not appropriated for the lease payments. As a result of this clause, most state and local governments' laws do not legally classify lease revenue bonds as long-term debt.^[2]

STRUCTURE OF DEBT SERVICE

Debt service refers to the payment of principal and interest on bonds. The structure of debt service addresses issues such as the timing of principal and interest payments and the process by which interest rates are set.

Most government debt is structured as serial bonds, in which a portion of the principal is repaid each year over the life of the debt. The interest rate on serial bonds varies by maturity (the date on which the principal is repaid to investors), with the shortest-term series usually having lower interest rates than the longer-term series. Some governments also issue term bonds, in which the principal is due in one or two lump sum payments in the final years the bonds are outstanding. Throughout the life of the term bonds, the government makes interest payments and transfers funds into a sinking fund to generate sufficient funds for the eventual repayment of the principal. Governments also may issue bonds that are a combination of serial and term bonds.

Government bonds are usually structured as level debt service or level principal payments.^[3] Level debt service is similar to how mortgage payments are structured in that the total amount of principal and interest paid each period is equal. The advantage of a level debt service structure is that it provides stability in the budget, because the same amount is due each year. In contrast, under a level principal structure, the amount of principal repaid each period is equal, and the debt service payments decrease over time.

Bonds can be structured with fixed-rate interest rates or variable-rate interest rates. With fixed rates, the interest rate on each serial payment is set at the time the bonds are issued, while with variable rates, the rates typically vary over the life of the bonds. In the latter case, the interest rates can be tied to some type of market index and are reset at specified intervals, such as daily, weekly, monthly, or annually.

Bonds also may be structured with a call option, which allows a government the option of repaying the debt prior to maturity. This may be helpful for a government that would like to be able to refund bonds in the future to take advantage of lower interest rates. However, the inclusion of a call option typically results in a slightly higher interest rate on the original bonds.

DEBT ISSUANCE PROCESS

Professional Advisors

State and local governments typically receive assistance in the debt issuance process from a team of professionals, including a financial advisor, a bond counsel, and underwriters.

The role of the financial advisor is to assist the state or local government throughout the debt issuance process. This may include helping the government decide what type of debt to issue, how much debt to issue, and the necessary steps to obtain the appropriate legal approvals. The financial advisor also may help the issuer structure the debt and prepare the official statement. The official statement is a document for investors that describes the bond issue and the financial condition of the government issuing the bonds. The financial advisors also may assist in selecting the other team members, obtaining a bond rating, and evaluating whether bond insurance is financially advantageous.

The bond counsel helps the government ensure that all legal provisions related to the issuance of debt are followed. This includes making sure that the debt is legally authorized, drafting legal documents, obtaining the necessary approvals, and helping the government adhere to all relevant legal procedural provisions. The bond counsel also is responsible for evaluating and certifying that the debt satisfies the legal requirements for being considered tax exempt.

The role of the underwriters is to identify investors willing to lend the government money. The underwriter purchases the bonds from the government and then sells them to investors. In a negotiated sale (explained below), underwriters may also be involved in many of the same types of activities as the financial advisor.

Method of Sale

Bonds typically are sold through competitive bid or a negotiated sale. In a competitive bid sale, underwriters or groups of underwriters called syndicates submit concealed bids specifying an interest rate for each serial maturity of the bonds. The bonds are then awarded to the underwriter or syndicate who submitted the bid that will result in the lowest overall interest cost for the government.

The bonds are typically awarded based on the calculation of the true interest cost—the TIC. The TIC takes into account the amount of interest paid, as well as the timing of those interest payments. Some governments used to (and some still do) award bonds on the basis of the net interest cost (NIC), which is based on the total interest payments but does not take into account

the timing of the interest payments. The TIC is preferred over the NIC, because the TIC takes into account the time value of money.^[4]

In a negotiated sale, an issuer selects an underwriter or syndicate well in advance of the sale date to help the issuer with the marketing and sale of the bonds. The issuer negotiates with the underwriter or syndicate to determine the underwriter's spread, which is the underwriter's compensation, and an interest rate for each maturity in the series. After an underwriter or syndicate purchases a government's bonds, the underwriter then sells the bonds to investors.

There has been an ongoing debate regarding whether it is better for a government to sell bonds through competitive bid or through a negotiated sale. Some professionals believe that the competitive bid process is more likely to result in a lower interest cost, especially for bonds that are "plain vanilla."^[5] This means that the issuer is known in the market and that the bonds do not have a complicated structure or security. Competitive bid also has an appearance of fairness, in that the bonds are awarded through a sealed bid process to the underwriters that submit the bid with the lowest interest cost.

However, in some cases, critics note that a negotiated sale may be preferable. With a negotiated sale, the underwriters know in advance of the actual sale that they will be awarded the bonds and, therefore, may be more willing to invest in presale marketing of the bonds. If they are able to find investors for most of the bonds prior to the setting of the interest rates, they may be less inclined to incorporate a risk component into the negotiated interest rates.^[6] Negotiated sales also allow underwriters flexibility in structuring the bonds (such as maturity schedules and call features) and in selecting a sale date depending on the condition of the market. In a competitive bid sale, the structuring of the bonds and sale date have to be decided and announced in advance. Another potential advantage is that a negotiated sale tends to allow a government more flexibility in pursuing policy objectives, such as making bonds available to citizens as investments or facilitating participation by locally-owned businesses or minority- or women-owned businesses.^[7]

However, the increased discretion in selecting an underwriter for a negotiated sale raised some concerns about the relationship between underwriters' contributions to political campaigns and the awarding of bonds by elected officials who received those funds. In response, the Municipal Securities Rulemaking Board established Rule G-37, which states that municipal securities brokers and dealers generally are prohibited from engaging in municipal securities business with an issuer within 2 years after having made a contribution to that official.

Bond Ratings

Most governments that sell bonds in the national market obtain a bond rating prior to the sale. A bond rating is the assignment of a grade by a private bond rating firm as to the creditworthiness (risk of default) associated with a particular bond issue. The bond rating firms utilize grades ranging from AAA to C. Higher-rated bonds typically receive lower interest rates than lower-rated bonds due to the lower perceived probability of a default.

Analysts for the bond rating companies assess the structure of the particular bond issue and the financial security backing the bond. For a general obligation bond, the bond rating analyst also addresses the issuer's managerial capabilities, debt burden, financial and operational factors, and the economic conditions of the government's jurisdiction. For a revenue bond, the bond rating analyst considers other factors such as the coverage ratio (the ratio of net revenues to annual debt service) and the structure of a reserve fund to pay for debt service if sufficient revenues are not available.

Bond Insurance

In some cases, a government may find it advantageous to purchase bond insurance from a private company. In exchange for an insurance premium, the bond insurance company agrees to pay the debt service if the government is unable to make the payments. For insured bonds, the bond rating is based on the bond rating for the private bond insurance company rather than the government issuing the debt. Historically, the major municipal bond insurance companies have been rated AAA, the highest bond rating. In assessing whether bond insurance is prudent, the government should weigh the cost of the insurance premium versus the present value of the expected decrease in interest costs associated with a higher bond rating.

Use of Technology

Governments are beginning to increase their use of technology for activities related to the issuance of municipal bonds. Recently, some governments have sold their bonds through a bond auction held on the Internet. This has allowed governments to try innovative features such as selling serial bonds maturity-by-maturity rather than on an all-or-none basis and selling bonds directly to large institutional investors. The City of Pittsburgh, one of the pioneers in this area, notes that it has obtained significant savings by using the Internet for bond sales.^[8]

DISCLOSURE

State and local governments that issue debt are obligated to provide investors with relevant and timely information about the bonds and the financial condition of the government. Although there have been few government bond defaults, situations such as the Washington Public Power Supply System bond default in the 1980s and the financial difficulties of Orange County, California, in the 1990s, have drawn increased attention to the importance of having appropriate disclosure.^[9]

The Government Finance Officers Association (GFOA), which is a membership organization of state and local budget and finance officials, has established *Disclosure Guidelines* to assist state and local governments with the disclosure of appropriate information related to the issuance of debt. The Securities and Exchange Commission Rule 15c2-12 also requires underwriters of state and local government bonds to adhere to certain reporting requirements. In addition, some governments are utilizing their web sites to make relevant information available to investors before and after the sale of bonds. The latter is especially important, because many state and local government bonds are traded in a secondary market after the initial sale.

Decentralization in Developing Countries

Scott Fritzen

Lee Kuan Yew School of Public Policy, National University of Singapore, Singapore

Patrick W. Ong

Peace and Equity Foundation, Quezon City, Philippines

INTRODUCTION

Decentralization as an approach to development administration occupies an important conceptual position within the development discourse. Manor sums up the situation nicely, in so doing emphasizing the rhetorical importance of the concept to developing country governments themselves:

[Decentralization] is being considered or attempted in an astonishing diversity of developing and transitional countries—by solvent and insolvent regimes, by democracies (both mature and emergent) and autocracies, by regimes making the transition to democracy and by others seeking to avoid that transition, by regimes with various colonial inheritances and by those with none. It is being attempted where civil society is strong, and where it is weak. It appeals to people of the left, the center and the right, and to groups which disagree with each other on a number of other issues.^[1]

Even officials in Myanmar, one of the world's most centralized states, have expressed the need for reforms involving a degree of decentralization.^[2] Decentralization has been applauded for its supposed potential to improve levels of public participation, bureaucratic accountability, administrative efficiency, and responsiveness to local needs, among other goals.

Yet, the assessment of decentralization in a significant share of the academic and practitioner literature has shifted from marked optimism to one of caution, even pessimism. Since the 1990s, except for some overly sanguine donor reports, the “decentralization-is-problematic” argument predominated in the academic literature. Analysts typically point to one or more dangers such as increasing inequality, the empowering of local elites, political instability, and general ineffectiveness.

This review begins by presenting a means of classifying the different forms of decentralization and their ideological underpinnings. The roots of decentralization's renaissance are then traced to a complex set of political realities and motivations in the centralized governments that undertook this reform. Some problematic issues and controversies surrounding decentralization are explored in the concluding section.

DISSECTING DECENTRALIZATION

The most common typologies of decentralization attempt to distinguish between the various functions and/or resources being decentralized. One often-cited classification presumes four broad categories of decentralization: administrative; fiscal; political; and market.^[3]

Administrative decentralization refers to the transfer of policy making, planning, and management responsibilities from central to local levels. Distinctions are often made between two subtypes:

- **Deconcentration**—in which branches of the central government are geographically dispersed, but no real authority is transferred to lower levels. If the Ministry of Finance opens offices at the district level, in an attempt to improve tax collection in problematic districts, this would be an example of deconcentration.
- **Delegation**—in which authority for certain functions are transferred to lower levels, which remain substantially accountable to (but not directly controlled by) the central level.

Fiscal decentralization refers broadly to efforts to change the distribution and sources of resources available to local governments. Such efforts can take many forms, including transfers between levels of government, authorization of local borrowing, cost recovery, and changes to revenue sources available to local governments through taxes, user fees, and contributions.

Political decentralization (or devolution) refers to attempts to devolve powers to democratically elected local governments or, in much weaker forms, attempts to make local governments more accountable to communities through the establishment of oversight boards or the introduction of new forms of citizen participation in development projects and policy making.

Finally, *market decentralization* involves attempts to transfer substantive control over resource allocation to non-state actors. Privatization is the obvious example, and it can apply not only to state-owned enterprises but also to broad swathes of the economy.

Table 1 Nature and basis of decentralization

Nature of delegation	Basis for delegation	
	Territorial	Functional
Within formal political structures	Devolution (political decentralization, local government, and democratic decentralization)	Interest group representation
Within public administrative or parastatal structures	Deconcentration (administrative decentralization and field administration)	Establishment of parastatals and quangos
From state sector to private sector	Privatization of devolved functions (deregulation, contracting out, and voucher schemes)	Privatization of national functions (divestiture and economic liberalization)

(From Ref.^[4])

Another useful typology formulated by Turner and Hulme looks at the nature and basis of the transfer of authority innate in any form of decentralization.^[4] Normally, decentralization is based on territorial considerations, with the aim of bringing authority geographically closer to both the front-line bureaucrats and the public they service. In less common instances, transfers can be made on a functional basis, which results in transferring authority to specialized agencies. Thus, decentralization could have either a territorial or a functional basis.

Across these two categories, the nature of authority transfer could be any of three manners: delegation within formal political structures; transfer within public administrative or parastatal structures; or transfers to nonstate agencies. This classification yields the six forms of decentralization shown in Table 1.

The two sets of typologies presented here help clarify the concepts surrounding decentralization and enumerate the various ways in which it can be implemented. Not all experiences of decentralization, however, will fit tightly into these categories, as decentralization has often been implemented as a hybrid of these forms. The different manifestations of decentralization can be rooted in a wide range of ideologies, goals, and political contexts, which have served as distinct motivations among the central governments and multilateral aid agencies advocating decentralization.

PUTTING DECENTRALIZATION INTO CONTEXT

The 1980s saw the beginning of a wave of decentralization that had swept across the globe in the following two decades. What accounts for this growing prominence of decentralization as both a reform program and category of analysis? One factor is that interest in decentralization had, and still has, varied roots, as seen in the strong ideological bend of much writing on decentralization. Fig. 1 points to some of the aims

typically associated with different types of decentralization reforms. These include “economistic” interest in efficiency, classic “leftist” concerns with participation and democracy, and “rightist” interest in reducing state intervention in the economy.

Various regimes have used the ideologies presented above to explain their push toward decentralization, but, in addition to efficiency or empowerment rationales, central authorities have of course also driven by more self-serving motivations.

In his analysis of the political economy of decentralization, Manor^[1] pointed out that many centralized regimes had to engage in some form of decentralization, as a response to the public’s loss of confidence in their governments. Such a loss was often the result of the degeneration of existing patronage systems and political parties. “Regimes faced mounting demands from organized interests, yet sluggish economic growth and increasing corruption by political activists at all levels undermined their ability to respond to those demands” (on page 27 of Ref.^[1]). Decentralization thus became widely appealing to politicians, as a means of coping with an eroding centralized system, as it pushed the responsibility of responding to some of the public’s mounting demands to lower levels of authority.

Furthermore, the lack of conceptual clarity in the forms of decentralization within the earlier decentralization discourse debate enabled authoritarian regimes to borrow rhetoric associated with political

Fig. 1 A spectrum of ideological underpinnings of decentralization.

forms of decentralization, while pursuing administrative reforms requiring little systemic change and tending to strengthen central monitoring of peripheral regions.

ISSUES AND CONTROVERSIES IN DECENTRALIZATION

Does Decentralization Improve Service Delivery and Accountability?

Decentralization is at the heart of a range of reforms, seeking to improve service delivery through paving a “short road to accountability.”^[5] Citizens under a centralized regime normally have to voice their demand for better services to central authorities who, in turn, direct local-level bureaucrats to respond. By bringing policy makers closer to the public, decentralization makes it easier for citizens to voice their demands on government, as well as better monitor the performance of the responsible politicians or bureaucrat. Policy makers are also better able to monitor their subordinates who are in the front lines of service delivery.

There are several successful experiences, wherein decentralization played an instrumental role in improving basic service delivery, such as the experience of 16 municipalities in Columbia, where water, education, and road infrastructure improved. Another example is the City of Porto Alegre in Brazil, which experienced a doubling of enrollment rates and improved access to basic sanitation.^[6] Yet, while the available empirical evidence suggests a positive impact of decentralization on service delivery, the evidence is insufficient to conclude causality, as decentralization often coincides with other reform programs.^[7] Furthermore, since these studies did not collect household-level data, the impact of decentralization across different socioeconomic classes cannot be determined.

Accountability is also intended to improve with decentralization, as local political competition and the public's greater ability to monitor local officials can improve performance and lessen corruption. But these positive effects can be offset by several risks faced in the decentralization reform process.^[8] In places where powerful local elites exist, decentralization could serve as a vehicle for greater consolidation of their power and influence, leading to the eventual capture of the state. There is also the risk of expanding and further enrooting clientelist networks and patterns of patronage politics. Local politicians could, instead, choose to cater to a small subsection of the electorate who could be counted on for loyalty and political support, come election time. There is a growing consensus that context plays an important role in how decentralization affects accountability. The strength and influence of competing interest groups, levels of

economic and social inequity, and the capacity of institutional counterchecks on government (local legislature, judiciary, media, and civil society), among other factors, affect the impact of decentralization on accountability relationships.

Indonesia offers a good example of the ambiguity of a major decentralization reform. While its experience of “big bang” decentralization has clearly opened up new spaces for popular participation in political debate and for the watchdog groups in civil society, there has also been evidence of every one of the major problems associated with decentralization, such as “decentralizing corruption,” increased inequalities between resource-rich and resource-poor regions, and failure of the central government to successfully set and enforce minimum service standards in critical areas of national priority.^[9]

The World Bank suggests two conditions that allow political decentralization to bring about the promised improvements in basic social services: “First, voters must be more likely to use information about the quality of local public goods in their voting decision. Second, local political promises to voters must be more credible than regional and national promises” (on pages 89–90 of Ref.^[10])

Threat of Macroeconomic Instability

Fiscal decentralization entails a careful balancing act between the revenues and expenditures transferred from central to local governments. Decentralization can undermine the fiscal position of local governments with respect to transferred functions, leading to a deterioration of government service quality. On the other hand, increased central-level transfers can undermine local revenue-raising effort.

Aside from affecting service delivery and local taxation effort, fiscal decentralization also affects the macroeconomic stability of a country, as poorly planned fiscal decentralization can lead to uncontrolled local government budget deficits. The experiences of four Latin American countries underline the necessity of careful macroeconomic fiscal management. The transfer and expansion of local-government expenditure in Argentina, Brazil, Columbia, and Mexico, amidst fiscal decentralization, have made it more difficult for the central governments to control government budget deficits and stabilize inflation during the Latin American economic crisis in 1994–1995.^[11]

Litvack et al. argued that proper decentralization design could mitigate these problems.^[12] Some of the recommendations they offer include:

- Expenditure responsibilities among different levels of government should be clearly stated.

- Central-government transfers should be made transparent and predictable, ideally based on a simple and standard distribution formula.
- Local government should face restrictions in borrowing.
- Local-government borrowings should not be subsidized or guaranteed by the central government.

Does Decentralization Increase Fiscal and Capacity Disparities?

There is substantial evidence that significant administrative, political, or administrative decentralization can increase fiscal and capacity differentials between administrative units and local governments. Local governments differ greatly in their ability to raise revenue; hence, greater reliance on local sources will, in the absence of significant central-government transfers, raise disparities. This was the case in Indonesia, where even after central-government transfers, the poorest region has only 20% of the average regional per capita revenue.^[9] Hofman and Guerra also identified the existence of large fiscal disparities in Vietnam and China, linked to changing patterns in the financing of subnational governments.^[13] Their analysis shows significant but weak correlation between the levels of expenditure and the level of service delivery (using health and education indicators as a proxy). While their study does not show that decentralization had actually increased these disparities in expenditure and service levels, this is a reasonable conclusion.

Political decentralization expands the responsibilities of local government from just program implementation and service delivery to include policy-making. This necessitates a greater range of skills and capacities that local governments need to employ in order to fulfill their functions. These include technical and managerial skills, of course, but also extend to the sense of the legitimacy of local government in the eyes of the citizenry and its capacity to engage local populations in problem solving (which can depend both on government capacity and attitudes and on the density and quality of civil society locally). The point is that in all of these capacity areas above, we can expect local governments to vary fairly dramatically. This may not be a problem for large urban governments, as resources are more available to them, but it may pose a serious problem for small and far-flung local governments with limited financial and human resources.

This does not necessarily imply that service delivery performance itself, let alone development outcomes, diverged as dramatically; correlation between levels of expenditure, service delivery patterns, and outcome indicators in health and education, for instance, has

often been shown to be weak. Central-government efforts to address this issue have revolved around attempts to equalize fund transfers to local governments. Fiscal disparities across local governments decreased (to varying degrees) after fund transfers from central governments, as data from China, Indonesia, Philippines, and Vietnam indicate.^[13]

These considerations should not be taken to mean that decentralization always or necessarily fails in relatively poor areas of a country.

- One of the poorest provinces in Brazil was able to achieve impressive boosts in performance through creative local management, which Brazil's federal structure had, in turn, enabled.^[14]
- Fritzen^[15] modeled some of these complexities for Vietnamese provinces and districts, showing how the responses of, and the effects on, local governments of a central-government initiative to decentralize social policy functions varied dramatically. Fiscal, administrative, and political capacities, together with local socioeconomic conditions, all helped to predict the success of the scheme, but some poor local governments were able to find creative ways to overcome resource constraints.
- In Columbia, service delivery improved or remained the same in all of the 16 municipalities, where case studies of decentralization were undertaken following a decentralization initiative, notwithstanding well-documented, widening disparities.^[16]

Asymmetric decentralization has been proposed as an alternative framework to deal with capacity disparity problems associated with decentralization.^[5,12] The concept refers to the possibility of decentralization being applied to different degrees across subnational units, depending both on demand for the reform and on local-government capacity. The weakness of such a proposal is the complexity inherent in its implementation, which may be beyond the capacity of many central governments to effectively carry out.

How to Strengthen Local-Government Capacity

An important segment of the decentralization debate focuses on local capacity development framework. This involves specific attempts to develop theories about local government, which will facilitate central and donor interventions to support local capacity and institutional development. The major distinction among approaches to capacity building, which the emergence of structural and New Development Administration theorists has highlighted, is that between “supply-” and “demand-driven” orientations.

Supply-driven theorists tend to view local-government deficiency in capacity as a function of limited human and financial resources, which should be remedied, in Rondinelli's revealing phrase, "tutorially," i.e., gradually through patient central government and donor intervention, if possible *prior* to initiating decentralization.^[3]

In contrast, theorists such as Litvack think that the problem of whether local governments are capable of responding to central requirements and tasks is related at least as much to program design. "If bureaucratic requirements imposed by the center were more appropriate," argue Litvack and colleagues, "they might be less of a problem." Korten and Ostrom, from significantly different theoretical starting points, both emphasize the need to conceive of central level as creating *facilitative conditions* for local capacity development, as opposed to "supplying" the capacity itself.^[17,18] Fiszbein argues that local capacity development involves the promotion of "innovative and responsible leadership and civic involvement."^[16] These writers thus emphasize local *demand* for capacity development; this is basically a way of saying that "shifting responsibilities to lower-tier governments may provide the incentive for public officials to invest in capacity building or seek creative ways to tap into existing sources of capacity."^[12] Another aspect of this demand-driven approach is information sharing among local governments in service of a learning-by-doing strategy.^[19]

The Center's Role in Decentralization

The central government has a strong role to play in all systems, decentralizing or not. It provides overall policy direction, defines minimum standards of service delivery, transfers technical and fiscal resources to assist local governments, guards against local overspending, and monitors subnational performance. Aside from these, the central government should also support information sharing among different local governments. This could be done through recognition of exemplary local governments (an example of which is the "Gawad Galing Pook" awards annually given to innovative local governments in the Philippines), the articulation of minimum service standards, and support of local-government associations, among many other alternatives. These functions are crucial in mitigating some of the problems associated with decentralization.

How central-government actors, more used to a "command and control" style of government, adjust to their new roles is thus critical to reform success and is also contingent on the political configurations and impetus behind decentralizing reforms. Central-level readiness is an important input in the design of

the reform process. At least three types of problems related to the center's role are cited in the literature. An often-cited problem in literature is the tendency for central governments to abdicate important responsibilities in the process of decentralization. Second, complicated and cumbersome monitoring system designs may be beyond a central government's capacity to implement effectively, weakening the attempt to hold local governments accountable in areas of high national priority. Third, some powerful central-level actors may oppose decentralization due to powerful interests in managing economic activities, as when ministries in Vietnam resisted decentralization of control over state-owned enterprises that had long proved a source of revenue and authority. Such resistance may even lead to currents of effective "recentralization," even when the process of ostensibly decentralizing rhetorically continues, as documented for Thailand by Mutebi.^[20]

CONCLUSION

Decentralization is likely to remain a key part of the rhetoric and practice of public sector reforms, but there is a need for the discourse to be more nuanced. It is not a one-way street and it is not irreversible, and attempts to recentralize can be expected. But whether or not recentralization occurs, the center will continue to play an important role in decentralizing systems and, thus, needs to be given further attention. It may be useful to think of a pendulum in center-local relations, wherein ultimately no set equilibrium will ever be reached.

Beyond center-local relations, there is also a need for greater care in defining and contextualizing decentralization. It is not enough to simply categorize the reforms being implemented. Critical attention should be given to factors underpinning the "demand" for (or appropriateness of) decentralization—such as the degree of socioeconomic development and size of a country—and the ability of a country to "supply" functioning decentralized institutions—such as the existing degree of responsive governance. The immediate political circumstances underlying decentralization reforms also must be characterized, in order to understand how they are changing the constellation of stakeholders in a country.

Finally, understanding the national context of decentralization is not enough. Literature should also pursue a greater understanding of the subnational context. There is little understanding of how policy processes and decision making take place at the local level. Anthropology of the local state must be developed, to help gather empirical data on the variations among local political structures and institutions.

This would bring about a more complete picture of the problems and prospects of decentralization reforms in developing countries.

Decentralization in Southeast Asia

Ledivina V. Cariño

National College of Public Administration and Governance, University of the Philippines,
Quezon City, Philippines

INTRODUCTION

Decentralization is an important political process that holds the promise of enhancing any society's enjoyment of democracy and development. This article focuses on how its two principal types, devolution and deconcentration, have been manifested in Southeast Asia. Specifically, it discusses how colonialism and the later struggle against home-grown authoritarian regimes have put a stamp on the efforts of the countries of the region to close the gap between the rulers and the ruled. The present trend is a movement from centralization to devolution, with even those states choosing deconcentration doing so within a larger governance framework of a limited state and popular participation. The article ends with warnings about possible pitfalls of decentralization and how these may be contained.

PRINCIPAL DECENTRALIZATION CONCEPTS: DEVOLUTION AND DECONCENTRATION

"Decentralization" refers to the transfer of powers, functions, and resources away from the central government. It is supposed to bring government closer to the people. How it does that depends on the type of decentralization chosen. Greater physical access to government offices and services can be accomplished through "deconcentration," which is the creation of a system of field units staffed by civil servants who draw their salaries from, and implement programs drawn up by, the central government. Deconcentration, also called "administrative decentralization," is more strictly defined as the transfer of functions and resources alone, because power remains at the center and the transfer is effected to agents of the central government that remain responsible to, and are controlled by, it. The expected main strengths of deconcentration are greater efficiency in service provision and the equal treatment of all localities within the national territory.

Government can also be brought closer to the people by granting them power to select their own officials, and, through them or directly, make the decisions for their own localities. This type of decentralization is called "devolution," where the central government

transfers powers to elected local governments. Devolution, also called "political decentralization," is usually accompanied by local autonomy and is often regarded as the higher form of decentralization. In fact, "decentralization," unqualified, is usually used as a synonym of devolution.

Devolution shares with deconcentration the advantage of improved access and efficiency. However, the principal strengths of devolution lie in its accountability and responsiveness to the people. Although the center continues to see to it that all local governments maintain national standards and less developed ones are assisted in the performance of their functions, the accountability of local governments is primarily to its citizens. Because of this, it is expected to fashion programs more in tune with the particular demands of its local inhabitants, instead of being bound by the homogenizing ethic that deconcentration follows.

Deconcentration and devolution are two ends of a continuum rather than mutually exclusive categories. For instance, devolution in the Philippines is widely accepted as the most evolved in the region, with local governments elected for the last half-century and major functions transferred to these local units since 1991. However, education, the biggest sector (accounting for 18% of the state budget and a third of the civil service force), remains a deconcentrated function. Besides, the central government continues to perform some of the devolved functions instead of concentrating on national standard setting, monitoring, and incentives provision, its appropriate roles in a regime of devolution.

Also, federalism, being a union of autonomous sub-national units called states, is usually associated with devolution. However, despite having the only federal structure in the region, Malaysia maintains a deconcentrated system of governance. Local chief executives of the states are either hereditary or appointed by the Malaysian king, the *Yang di Pertuan Agong*. In turn, the state governments appoint the heads of local bodies. Moreover, the federal government can make and has made binding decisions on matters in the State List, with nary a complaint from the local units. Besides, close to 85% of total government revenues accrues to the federal government, giving the states very little room to fund their own programs.^[1]

The wide variety of arrangements and processes that fall under the rubric of decentralization conveys a sense of the complexity of the concept. No nation has stuck to only one option, and the decentralization regime of each country is a product of its own history and culture; the pressures of its political, economic, and social forces; and even the demands of the global environment.

IMPACT OF COLONIALISM ON SOUTHEAST ASIAN DECENTRALIZATION

Western colonialism to a large extent drew the boundaries of the nations of Southeast Asia, and its legacy continues to be manifested in the decentralization status and struggles of these nations. What is now Malaysia consists of individual kingdoms until the 18th and 19th centuries. The British consolidated them as a federation under a British resident-general, with each territory ran by their respective sultans with a British adviser. Thus the federal structure of Malaysia has its roots in colonial times. Meanwhile, French Indo-China consisted of Cochinchina, Tonkin, Annam, Laos, and Cambodia. Upon independence, Laos and Cambodia claimed the land of their precolonial kingdoms, while the first three territories formed the present Vietnam.

Perhaps the most problematic colonial bequests are the archipelagoes of Indonesia and the Philippines whose component islands were separate kingdoms until they were ruled as single colonies by the Netherlands and Spain, respectively. The idea of a single nation was born practically only in their respective struggles for independence.

The Netherlands imposed a federation of 15 republics on newly independent Indonesia in 1947. This was reversed with the creation of a unitary state in 1950. At present, most of the former Dutch East Indies have accepted the idea of national unity under one Indonesia, except for Aceh and Papua whose demand is for independence. Indonesia has responded with Law 18/2001 and Law 22/2001, granting them greater autonomy. East Timor, which was recently granted independence from Indonesia, used to be a Portuguese, and not a Dutch colony. For the rest of the country, resistance has been directed instead against the centralizing policies of Jakarta and the loss of regional identity and autonomy. Similarly, the Philippine territory is defined as it was when the United States (successor colonizers to Spain) left in 1946, but secessionist movements raged in areas not completely colonized by the West. The Philippine government countered with proposals to give autonomous status to Muslim Mindanao and the Cordilleras, upon approval by their inhabitants in a special plebiscite. The organic laws were accepted

in parts of Mindanao but not in the Cordilleras; thus the former enjoys devolved powers while the latter remains simply an administrative region. In the case of both Indonesia and the Philippines, the autonomy afforded these territories is an exception to the general level of devolution provided to the rest of the local governments in these nations.

While there is no necessary historical sequence to decentralization, most countries experience it first as deconcentration. It has been said that in Thailand, anyone wishing to ignore the government simply disappears into the hinterlands.^[2] However, a field unit makes that less possible. Thus deconcentration extends the reach of the State. Moreover, it also attempts to maintain equity and justice by treating all areas as homogeneous parts of the territory. Nevertheless, with no accountability to the people it serves while being so distant from the center to which it is supposed to be responsible, that unit may simply intone, as the Spanish colonial field officials used to say in the Philippines, “obedeusco pero no cumplo” (“I obey but I do not comply”).^[3] Thus rules and regulations that stream from the center may be followed to the letter, but the spirit of service and equity that animates them may be lost as they move down through several layers of the bureaucratic hierarchy.

GROWTH OF DEMOCRACY AND DEVOLUTION

The last decade of the 20th century has seen a clear trend in Southeast Asia toward devolution and a loosening of central control even in deconcentration. Devolution has commended itself as a result of the growth of democracy, or at least, the idea of democracy, in the region, and the rise of an awakened citizenry that demands a say in governance. These factors are associated with economic growth and an expanding middle class. They are complemented by the demonstration effect of experiences in neighboring countries, made visible and immediate by mass media, technological developments, intraregional information exchanges, and the support of international donor organizations for decentralization. The effects of these factors can be seen in the devolution experiences of the Philippines, Indonesia, Thailand, and Cambodia, all of whom emerged from authoritarian rule in the last 15 years of the last century.

The Philippines started the trend with the overthrow of Martial Law President Ferdinand E. Marcos in a peaceful 4-day “People Power Revolution” in 1986. In the redemocratization period that followed, it wrote into the Constitution of 1987 the principles of local autonomy and people’s participation in governance. Although the Philippine decentralization movement has its roots in the 1960s with the election of councils

at village level, the landmark devolution law was enacted only in 1991, with people power euphoria still in the air. The Local Government Code devolved major powers to local government units, and increased their revenues as well as their taxing powers. It also provided for citizen participation in local governance through the inclusion of people's representatives in five local special bodies.

Similarly, devolution in Indonesia is a component of *Reformasi*, the movement for reform that toppled the three-decade-long rule of President Suharto in 1996. Post-Suharto amendments to the constitution provide for wide-ranging autonomy to regional governments and democratically elected local legislatures at provincial, town, and city levels. Law 22/1999 and Law 25/1999 provide for devolution and its concomitant, fiscal decentralization, respectively. These laws are based on the principles of democracy, community participation, equity and justice, recognition of the potential and diversity within regions, and the need to strengthen local legislatures. Law 22 gives the provinces a dual status, as autonomous regions and as administrative arms of the center. Meanwhile, it gives full autonomy to districts and municipalities (rural and urban local governments, respectively), devolving powers to them except in security and defense, foreign policy, monetary and fiscal matters, and justice and religious affairs, similar to a federalistic allocation of powers.^[4-7]

A peaceful revolution of the Thai middle class overthrew the military government in 1992, and gave rise to the new democratic Constitution of 1997. That constitution was both democratically written—because even ordinary citizens could submit their suggested drafts—and democratic in substance and spirit. It sought to enhance public participation in governance and to promote new channels for democracy, including a National Decentralization Committee that includes private citizens.^[8] Nine articles on local self-rule and decentralization have served as the basis for a series of decentralization laws and policies passed since 1999. The most important of these is the National Decentralization Act, which specifies devolution in 4 years and change of the ratio of expenditure between central and local government from 91:9 in 1999 to 65:35 in 2006. Meanwhile, the Municipality Act of 2000 mandates that mayors of metropolitan municipalities and cities would be directly elected at the end of their current term.^[9]

Cambodia, meanwhile, emerged from a bloody civil war that transformed it from a socialist state into a multiparty liberal democracy in 1993. Decentralization has been at the heart of its rehabilitation, being a feature of the *Seila* (Stone Foundation) Program and other reform initiatives of the Royal Government of Cambodia. A poverty-alleviation pilot program supported by the United Nations Development Program,

Seila attacks poverty by strengthening local government structures from the commune level upward. The government has written Seila's decentralization mechanisms into the 2001 Law of Administration of Communes. In 2002, elected commune officials replaced state appointees and started to wield powers in order and security, health, economic and social development planning, cultural and environmental property, and general welfare.^[10]

For the other countries, deconcentration remains the prevailing decentralization mode. However, recognizing the problems of central control that it represents, administrative decentralization is now embodied within a larger governance framework that involves providing field units more autonomy, the participation of the citizens, and fledgling efforts toward elected local units. The size of the city-state of Singapore gives it little option except deconcentration, but it is nevertheless moving away from classic central control to allowing more autonomy to be exercised by administrative units such as schools and health centers. This has happened even in Vietnam, a socialist State that recognizes the Communist Party as the force leading State and society and practices democratic centralism. The Government is the executive body of the National Assembly and the highest administrative body of the State. It directs the work of ministries at the central level as well as People's Committees (PCOMs), the executive bodies at the local levels. Although People's Councils are elected at provincial, district, and commune levels, they are supervised and guided by the Standing Committee of the National Assembly and the Government and are thus not autonomous local bodies. Nevertheless, as the program of *doi moi* (renovation) is moving the country from a centrally planned to a more market-oriented economy, Vietnam's Public Administration Reform (PAR) program embodies a complex decentralization agenda. Launched in 1995, PAR specifies the centralization of all regulation-making tasks and the decentralization of economic and social decision making. Thus the Grassroots Democracy Decree (No. 29, passed in 1998) gave elected commune-level administrations the task of ensuring that the citizens exercise their rights, and that government be accountable to households for information about local activities and finances.

CONCLUSIONS: PROBLEMS AND CHALLENGES FOR DECENTRALIZATION

The popularity of decentralization in all the countries of the region does not imply that it is a panacea for all the ills of governance and development. There is a need for complementary policies and measures to be

able to achieve poverty reduction, people's participation, and economic development.

Moreover, there are problems associated with decentralization itself. If power is transferred to officials who care more for their self-interest than the general welfare, decentralization can conceivably nurture fiefdoms of corruption and abuse. This suggests the need for decentralization to be accompanied by strong accountability mechanisms, such as local media and civil society, and impartial central oversight agencies. Many analysts also point to the issue of fiscal decentralization, which do not necessarily move concomitantly with power decentralization. Some countries decentralize power but keep the control of funds at the center, making the local units incapable of adequately serving their constituents. On the other hand, a generous center may keep local units dependent on its largesse and unable or unwilling to generate local revenues that could make them unpopular with the people. Other problems may arise because of the weakness of the new decentralized structures, the lack of competent officials and staff in many localities or their greed and power-hunger, and the absence of active citizens and institutions that can help both in capability building and in exacting accountability from the field units and local governments. Decentralization is a means of moving government closer to the people. Yet as has been seen, in many Southeast Asian countries, this is not a one-way street as the people have gotten new decentralization policies through their own demands and struggles. A similar militancy is necessary so that its gains are constantly monitored and defended and its ills minimized.

Decision Making in Administrative Organizations: Theories

James S. Guseh

*Department of Public Administration, North Carolina Central University,
Durham, North Carolina, U.S.A.*

INTRODUCTION

Decision making is the process of choosing from among alternative courses of action. It is both an objective and a subjective process. The objective process involves setting goals and formulating an efficient process for attaining the goals. The subjective process may involve the values of decision makers, which may lead to the acceptance of a satisfactory rather than an optimum solution. Decision making is central in public administration because it is one of the core managerial functions in organizations. How decisions are made, what criteria are used, what costs are involved, and who benefits are some of the important questions that characterize the decision-making process. Thus, how managers are judged depends on the decisions they make.^[1]

There are various theories or models of decision making. This article focuses on the five dominant models of decision making: the classical, bounded rationality, incremental, mixed scanning, and garbage can. An emerging model of decision making, known as win-win analysis, which seems to address some of the limitations of the other models, is also discussed. The analysis includes the approaches utilized by each model, the criticisms, and other dimensions of the process.

and analysis of which means of attaining them are most reasonable, i.e., require the least input of scarce resources. ... Thus, whenever economists refer to a "rational man" they are not designating a man whose thought processes consist exclusively of logical propositions, or a man without prejudices, or a man whose emotions are inoperative. In normal usage all of these could be considered rational men. But the economic definition refers solely to a man who moves toward his goals in a way which, to the best of his knowledge, uses the least possible input of scarce resources per unit of valued output.^[2]

Although the steps involved have been outlined in various ways by different authors, the essential elements involved the following steps:

1. Identify the problem to be solved.
2. Establish the evaluation criteria for problem resolution.
3. Propose the various alternatives for solving the problem.
4. Analyze the likely consequences of each.
5. Compare and evaluate the results of each alternative.
6. Choose the best alternative.
7. Implement the chosen alternatives.
8. Evaluate the results.

THE RATIONAL MODEL

The rational model of decision making, also known as the classical or economic model, has held a prominent place in the literature in public administration. The model is derived from economic theory that people seek to maximize utility and pursue their self-interests. The model is based on the assumption that people are economically rational and attempt to maximize outputs for a given input or minimize input for a given output in an orderly and sequential process. Political economist Anthony Downs presents the economic analysis of the rational model as follows:

Economic analysis thus consists of two major steps: discovery of the ends a decision maker is pursuing

Details of each step can be addressed as separate topics but are not discussed in this article.

Although, in actuality, the decision-making process is rarely this orderly, the rational model has had a significant influence on decision making in bureaucracy. For example, it is reported to have been applied in some form by President John F. Kennedy's administration to address the Cuban Missile Crisis in 1962.^[3] It has also been employed in addressing many urban problems in American cities such as Cleveland, Dallas, Dayton, Fort Worth, Long Beach, Philadelphia, Phoenix, Pittsburgh, San Antonio, San Francisco, Virginia Beach, Roanoke, and Greensboro, to name but a few.^[1]

Despite its widespread application in organizations, the rational model has been challenged since the late 1950s. One of the leading critics of this model is Nobel

laureate Herbert Simon. While the rational decision of the classical model assumes that the decision maker is completely informed about both the organizational goals and all the possible alternatives and acts to maximize utility, the administrative decision maker can rarely approximate the kind of rationality assumed by the classical economic model. Rarely can an administrator count on full knowledge of the situation, including the consequences of the various alternatives. According to Simon:

It is impossible for the behavior of a single, isolated individual to reach any high degree of rationality. The number of alternatives he must explore is too great, the information he would need to evaluate them so vast that even an approximation to objective rationality is hard to conceive. Individual choice takes place in an environment of “givens”—premises that are accepted by the subject as bases for his choice; and behavior is adaptive only within the limits set by these “givens.”^[4]

Thus, Simon put forth a more realistic model of decision making known as the bounded-rationality model.

THE BOUNDED-RATIONALITY DECISION-MAKING MODEL

This model represents the decision maker as an “administrative man” with limited information-processing ability. According to Simon, the decision maker’s ability to analyze the alternatives and objectives is limited or bounded to varying degrees. He explains the concept as follows:

When the limits to rationality are viewed from the individual’s standpoint, they fall into three categories: he is limited by his unconscious skills, habits and reflexes; he is limited by his values and conceptions of purpose, which may diverge from the organizational goals; he is limited by the extent of his knowledge and information. The individual can be rational in terms of the organization’s goals only to the extent that he is *able* to pursue a particular course of action, he has a correct conception of the *goal* of action, and he is correctly informed about the conditions surrounding his action. Within the boundaries laid down by these factors, his choices are rational—goal-oriented.^[5]

Unlike the “economic man” of the classical economic model who seeks to maximize, the “administrative man” seeks to “satisfies,” i.e., find satisfactory solutions rather than maximize. While the economic man seeks rationality, the administrative man recognizes the limits of his capability for rational behavior. The administrative man is content with a simplified

and incomplete view of the world that can never, because of human limitations, approximate the complexity of the real world. Simon highlights the characteristics of the administrative man as follows:

First, because he satisfies rather than maximizes, administrative man can make his choices without first examining all possible behavior alternatives and without ascertaining that these are in fact all the alternatives. Second, because he treats the world as rather “empty,” and ignores the “interrelatedness of all things (so stupefying to thoughts and action), administrative man is able to make his decisions with relatively simple rules of thumb that do not make impossible demands upon his capacity for thought.^[6]

Thus, while the administrative man cannot achieve the ideal behavior of the classical economic man, he does the best with what he has. He is willing to settle for an adequate solution in contrast to an optimal one.^[7]

The steps in the bounded-rationality model are as follows:^[8]

1. Identify the problem to be solved or goal to be defined.
2. Determine the minimum level or standard that all acceptable alternatives will have to meet.
3. Choose one feasible alternative that will resolve the issue.
4. Appraise the acceptability that will resolve the issue.
5. Determine if it meets the minimum levels that have been established.
6. If the alternative is not acceptable, identify another and put it through the evaluation process.
7. If the alternative is acceptable, implement it.
8. After implementation, determine how easy (or difficult) it was to discover feasible alternatives and use this information to raise or lower the minimum level of acceptability on future problems of a similar nature.

How accurate is the bounded-rationality model? Empirical studies have shown that the model is very accurate.^[9,10] A comparison of the classical economic model and the bounded-rationality model shows that the latter presents a more realistic view of decision making.

INCREMENTAL MODEL

Political scientist Charles Lindblom has also criticized the rational model. He argues that the rational model suffers from a number of limitations, such as:^[11]

1. Human intelligence or problem-solving capacity is too limited to encompass all of the options

and potential outcomes of the alternatives generated by the synoptic approach.

2. Information is not adequate to assess all options accurately.
3. Comprehensive analysis requires too much time.
4. Comprehensive analysis is too expensive.
5. Facts and values cannot be neatly separated as required by the comprehensive approach.

Lindblom offers another theory of decision making, variously called incrementalism, muddling through, and successive limited comparisons. Incrementalism, in contrast to the rational model, stresses decision making through a series of limited, successive comparisons, with a relatively narrow range of alternatives rather than a comprehensive range; it uses the status quo, not abstract goals, as the key point of reference for decisions. Incrementalism focuses primarily on short-term rather than long-term effects, on the most crucial consequences of an action rather than on all conceivable results, and on less formalized methods of measuring costs and benefits.^[12]

The essential elements of this model include the following:^[11,13]

1. Goals are not isolated and determined before analysis begins. Goal determination and analysis are closely intertwined, even simultaneous. The means often affect the ends, and vice versa.
2. Decision makers usually consider only a limited number of alternatives—ordinarily only those that differ marginally from existing policy.
3. All consequences, even of the more restricted options, are not evaluated. All consequences cannot be known, and the time and effort required for comprehensive assessment normally are unavailable.
4. Since means and ends are inseparable, problem redefinition is continuous, analysis is never ending, and policy is never made once and for all but remade endlessly.

Lindblom has presented several arguments to support this model. Errors resulting from employing incremental changes from the status quo may not have serious implications and may be easier to correct. Politically, incremental solutions are easier to agree upon, since this change may fall somewhere between extreme positions, thereby getting plurality support. Lindblom further maintains that making continual incremental adjustments in both the problem definition and proposed solutions is a reasonable and effective method of solving problems and making decisions.

Like the rational model, the incremental model has also come under attack. Two of the leading critics,

Yehezkel Dror and Amitai Etzioni, have identified serious shortcomings of the model, and the latter has proposed an alternative model of decision making. According to Dror, the incremental changes may not address real-world problems, such as a declaration of war that may require innovative solutions that are bolder than those of the incremental approach. Thus, the incremental approach does not facilitate or provide a basis for organizational motivation or change but, instead, facilitates the maintenance of the status quo. According to Dror, incrementalism works best when:^[14]

1. The results of present policies are satisfactory.
2. There is a high degree of continuity in the nature of the problems.
3. There is a high degree of continuity in available means for dealing with the problem.

Expanding on Dror's criticisms, Etzioni argues that the incremental approach fails to distinguish between fundamental and nonfundamental decisions. He suggests that the incremental approach is suitable for nonfundamental matters but not for fundamental ones, where a wider perceptual horizon is needed.^[15] Etzioni has proposed an alternative approach to decision making, known as mixed scanning.

MIXED SCANNING

This approach combines the best features of both the rational and incremental approaches to decision making. As Etzioni describes decision making:

Fundamental decisions are made by exploring the main alternatives the actor sees in view of his conception of his goals, but—unlike what rationalism would indicate—details and specifications are omitted so that an overview is feasible. Incremental decisions are made but within the context set by fundamental decisions (and fundamental reviews). Thus, each of the two elements in mixed-scanning helps to reduce the effects of the particular shortcomings of the other; incrementalism reduces the unrealistic aspects of rationalism by limiting the details required in fundamental decisions, and ... rationalism helps to overcome the conservatism slant of incrementalism by exploring longer-run alternatives.^[15]

According to Etzioni, one of the instances in which this model applies is in the court system. With many cases to decide, lower courts tend to apply the incremental approach by maintaining or slightly deviating from the status quo. When cases are appealed, higher courts tend to analyze issues in more

detail, using the rational approach, in order to make fundamental (and sometimes bold) decisions.

Despite this example of when this model is applied, the major criticism is that it provides few guidelines for how and when it should be employed.

THE GARBAGE-CAN MODEL

While the approaches to decision making discussed earlier may suggest that organizations make decisions under conditions of much certainty and knowledge, Michael Cohen, James March, and Johan Olson have examined decision making under conditions of unclear organizational setting. That is, there are circumstances in which organizations have “goals that are unclear, technologies that are imperfectly understood, histories that are difficult to interpret, and participants who wander in and out.”^[12] Cohen et al. have termed these conditions as “organized anarchies.” Such organizations operate under conditions of pervasive ambiguity, with so much uncertainty in the decision-making process that traditional theories of coping with uncertainty do not apply.^[12] Thus, they consider an organization as “a collection of choices looking for problems, issues and feelings looking for decision situations in which they might be aired, solutions looking for issues to which they might be the answer, and decision makers looking for work.”^[16] According to March et al., decision making in these circumstances is not regarded as a crisis or transitory. Instead, it is regarded as “characteristic of any organization in part,” and is “particularly conspicuous in public, educational, and illegitimate organizations.”^[7] Decision making under these conditions is referred to as the “garbage-can theory of organizational choice.”

The garbage-can model views:

a choice opportunity as a garbage can into which various problems are dumped by participants. The mix of garbage in a single can depends partly on the labels attached to the alternative cans; but it also depends on what garbage is being produced at the moment, on the mix of cans available, and on the speed that garbage is collected and removed from the scene.^[17]

Which problems get attached to which solutions is a major issue. “This is largely determined by chance—by what participants with what goals happened to be on the scene, by when the solutions or the problems entered, and so on.”^[7] Although the model may seem bizarre or pathological when compared to the traditional rational decision-making model, “it does produce decisions under conditions of high uncertainty: that is some solutions do get attached by some participants to some problems.”^[7]

According to Cohen and March, decision making in this model is made in three ways:^[18]

1. By oversight, without any attention to existing problems and with a minimum of time and energy.
2. By flight (or avoidance), postponement, or buck-passing.
3. By resolution, which occurs generally (on) when flight is severely restricted or when problems are relatively minor or uncomplicated.

In terms of application, this model seems to describe the decision-making processes by college and university presidents as follows:

Opportunities for choice in higher education can easily become complex “garbage cans” into which a striking variety of problems, solutions, and participants may be dumped. Debate over the hiring of a football coach can become connected to concerns about the essence of a liberal education, the relations of the school to ethnic minorities, or the philosophy of talent.^[7]

Despite the unstable environment or unusual nature of organized anarchies, leaders in these organizations can still improve their performance in decision making. Scott suggests that:

By carefully timing issue creation, by being sensitive to shifting interests and involvement of participants, by recognizing the status and power implications of choice situations, by abandoning initiatives that have become hopelessly entangled with other, originally unrelated problems, by realizing that the planning function is largely symbolic and chiefly provides excuses for interaction, leaders in organized anarchies can maintain their sanity and, sometimes, make a difference in the decision made.^[7]

In light of recent developments in many public organizations, this model of decision making may provide the most appropriate perspective from which to understand the complexity of government decision making in the 21st century.^[12]

WIN-WIN POLICY ANALYSIS

In each of the models of decision making discussed, there seems to be some trade-off among the alternative choices. For example, in the rational model, all decision makers involved may not agree on the evaluation criteria. The policy alternative selected may not be the choice of some decision makers. Thus, the evaluation criteria selected can determine the policy alternative that is chosen. In the case of the incremental

model, the incremental choice tends to be a compromise, whereby all major sides have to give up something to gain something.

An emerging decision-making model that seems to address the win-lose phenomenon in these models of decision making by presenting a win-win policy is referred to as win-win policy analysis or superoptimizing solutions. Although the model received initial treatment in the 1980s by various researchers, Stuart Nagel has expanded upon the model since the 1990s through various worldwide applications.^[19,20]

Win-win analysis is defined as formulating policies that exceed the best initial goals of expectations of all major groups involved in the policy dispute.^[20] The groups could be conservatives, liberals, and political parties. A win-win or superoptimum solution is different from a compromise. While in a compromise situation all sides lose something and gain something in order to arrive at an agreement, a win-win analysis is “capable of achieving conservative goals more than the conservative policies” and simultaneously capable of achieving the liberal goals more than the liberal policies.^[19,20] Win-win analysis has applications in any field of public policy, such as economic, social, political, legal, or environmental.

Nagel provides the basic steps in the win-win policy analysis and various ways to facilitate the development of win-win solutions. There are five basic steps to win-win policy analysis:

1. What are the major goals of conservatives, liberals, or other major groups who are disputing what policy should be adopted for a given policy problem?
2. What are the major alternatives of those groups for dealing with the policy problem?
3. What are the relations between each major alternative and each major goal? In their simplest form, these relations can be expressed in terms of a minus sign (relatively adverse relation), plus sign (relative conducive relation), and a zero (neither adverse nor conducive relation).
4. What new alternative there is might be capable of
 - a. achieving the conservative goals even better than the conservative alternative and
 - b. simultaneously capable of achieving the liberal goals even more than the liberal alternative? Whatever new alternative meets these two criteria is a win-win alternative or a superoptimum solution.
5. Is the proposed win-win alternative capable of getting over various hurdles that frequently exist? These hurdles may be, in random order, political, administrative, technological, legal, psychological, and economic.

There are various ways of facilitating ideas for win-win solutions, such as:

1. Expand the resources available so that both liberal and conservative goals can be achieved.
2. Modify the liberal alternatives so that they also achieve the conservative goals and/or modify the conservative alternatives so that they also achieve the liberal goals.
3. Redefine the problem to emphasize goals, rather than alternatives.
4. Fully combine alternatives that are not mutually exclusive.
5. Make use of a mind-stimulating matrix that shows goals on the column, alternatives on the rows, and scores or directions of relations in the cells. Have an empty row at the bottom of the matrix for inserting words and data on possible win-win solutions.

CONCLUSIONS

Decision making is important in administrative organizations. Although the various models of decision making discussed have their strengths and limitations, they provide insights into organizational decision making. Moreover, since the choices made can have positive or negative implications for the organizations, the type or mode of decision making employed is important. Given the importance of decision making in organizations, more research is needed to improve organizational decision making.

Decision Making, Incrementalism and Transformational Change

INTRODUCTION

Before the publication of Herbert Simon's text, *Administrative Behavior*, in 1957,^[1] most scholars showed little interest in decision making at the low levels in organizations. This surprisingly was due to the influence of the politics-administration dichotomy, which caused the focus to be on decision making at the highest level in organizations where policy was formulated. Simon's work, however, adjusted the focus when he asserted that decision making constituted the core of administration, and that the process was the same throughout the organization.^[2]

Decision making is one of most frequently discussed topics in public administration. The quest to understand the decision-making process is not new, and the process of "deciding" has frustrated many decision makers. Public sector managers are inundated with decision-making models. Despite these models and a proliferation of literature, no one model has been proffered as the "one best" method. Notwithstanding, the models, each with its strengths and weaknesses, present an array of choices for public managers.

DECISION MAKING: A DEFINITION

Starling^[3] defined decision making as the process of "selecting from various alternatives one course of action." Starling further postulated that the decision process involves several distinct steps: 1) identifying the problem; 2) gathering facts; 3) making the decision; and 4) implementing and evaluating the decision.^[3] An essential component in the definition is the final step, which emphasizes that the decision-making process does not conclude with the selection of a particular course of action. Simon^[4] reinforced this point when he stated, "the process of decision does not come to an end with the general purpose of an organization has been determined. The task of 'deciding' pervades the entire administrative organization quite as much as does the task of 'doing'."

The development of an ideal decision-making model with universal application seems impractical. Hence,

public sector managers utilize various models to select a particular course of action. This paper will address a few decision-making models.

DECISION-MAKING MODELS

There are several decision-making models, each based on a variety of premises and assumptions. The *Essence of Decision*^[5,6] provides frameworks for explaining decision making. Using three models, Rational Actor (Model I), Organizational Process (Model II), and Government Process (Model III), the authors outlined approaches to decision making by using the Cuban Missile Crisis to illustrate their application.

MODEL I: THE RATIONAL ACTOR MODEL

Stevenson et al.^[7] described the Rational Actor Model as a prescription that tells decision makers how to "decide." This model is based on two assumptions: all information is available to the decision maker, and the decision maker would maximize the decision to benefit the organization.^[8] The central concepts of the Classical Model are:

1. *Goals and objectives*: The rational decision maker ranks all possible sets of consequences in terms of his or her values and objectives.
2. *Alternatives*: The decision maker must choose among a set of available alternatives.
3. *Consequences*: To each alternative, there is a set of consequences or outcomes to be considered.
4. *Choice*: The decision maker selects the alternative with the highest payoff function.^[9]

The behavior of the actor—an individual, agency, or group—is intentional, goal seeking, and value maximizing. The decision maker employs rigor, purposiveness, and consistency—among goals and objectives.^[9] The comprehensive rationality component of this model infers that the decision maker has the ability to consistently rank and review all alternatives and

their consequences and then choose the alternative that achieves the highest utility.

MODEL II: THE ORGANIZATIONAL PROCESS MODEL

The Organizational Process Model's premise is that government decisions stem from the output of several agencies that provide information and advice. This model proffers decision making as less deliberate and the function of government's "vast conglomerate of semi feudal, loosely allied organizations each with a substantial life of its own," functioning according to standard patterns of behavior.^[9] Each organization is given individual aspects of a problem to attend to.

This model emphasizes that the organization's major concern is to operate within the framework with a set of constraints negotiated through various components of the organization. This helps them reduce uncertainty in the environment and set out those alternatives that are immediate, available, and related to the problem at hand. According to Allison and Zelikow,^[9] the decision-making process then can be understood with knowledge of the organizations' operations.

MODEL III: GOVERNMENT PROCESS MODEL

Allison's Governmental Politics Model stipulates that decisions are made through bargaining among individuals and groups with diverse interests and varying degrees of power to support those interests. Decisions reached are sometimes a result of compromise and the power and skill of proponents and opponents. Politics plays a major role in decision making. Decisions are made through the involvement of many actors who focus on many problems, numerous goals, some of which are personal, and by "pulling and hauling that is politics."^[9]

CRITICISMS OF ALLISON'S MODELS

The Classical Model appears to be oversimplified. It ostensibly makes unrealistic demands on the decision maker, who, according to Simon, must have "powers of prescience and capacities for computation resembling those usually attributed to God."^[5] In fact, decision makers experience considerable stress in attempting to deal with their limited cognitive abilities. President Warren G. Harding articulated the cognitive stress in the following statement:

John, I can't make a damn thing out of this tax problem. I listen to one side and they seem right, and then God! I talk to the other and they seem just as right, and there I am where I started. I know somewhere there is a book that would give me the truth, but hell, I couldn't read the book. I know somewhere there is an economist that knows the truth, but I don't know where to find him, and haven't the sense to know him and trust him when I did find him God what a job.^[10]

The cookie-cutter approach of the prescriptive classical model epitomizes logic, focus, and rationality, which, misleadingly, may convey the idea that the approach guarantees successful decision making. However, the model does not enjoy widespread use. According to the article, *The Wisdom of Solomon*,^[11] rational decision-making techniques are used "less than 20% of the time."

Models II and III have several weakness. According to Bendor and Hammond,^[12] the two models are "sufficiently ambiguous that it is difficult to discern the models' defining properties." Model III depicts decision making as a process involving many actors engrossed in "pulling and hauling." At the end of this process, one group triumphs over the others. Przeworski^[13] reminds us that during these political discussions, "reasons and facts are exhausted ... issues are decided by voting, which is an imposition of one will upon a resisting will ... Politics is an antagonistic relationship between 'us' and 'them' ...". This approach to decision making creates winners and losers. Although the process produces a decision that may be based on a mixture of alternatives, it might be a patchwork decision that can have disastrous consequences.

Bendor and Hammond^[12] articulated that the three models unquestionably have several important methodological points. However, the lessons learned from the models may lack foundation and, in some cases may be incorrect. Finally, it seems that the models do not provide good frameworks for low-level decision makers.

THE ADMINISTRATION MODEL

The Administration Model was proposed by March and Simon^[14] as a descriptive model that explains how decision makers actually make decisions. A decision maker using this model defines the problem in terms of his or her understanding of the situation, and does not consider all information, alternatives, and their consequences. This model may require decision makers to follow steps similar to those of the classical model, such as generating alternatives

and reflecting on their consequences. However, there is no impractical quest to glean all information. Instead, the decision maker collects relevant information based on a definition of the situation.^[15] Simon^[16] stated that there are limits to a decision maker's cognitive ability, and it is this bounded rationality that forces them to satisfice rather than optimize.^[14]

THE INCREMENTAL MODEL

Lindblom's^[17] Incremental Model offers another approach to decision making. Lindblom suggests that incrementalism is more likely used in practice. This method of decision making involves making sequential (incremental) decisions. Successive limited comparisons may be the most appropriate approach when problems are complex. Using the incremental model, the decision maker goes through the following steps:

1. An objective is established.
2. Few alternatives immediately relevant are outlined and then compared.
3. Select an alternative. This would be a combination of the choice among values and the choice among the instruments for achieving the objective.

With this approach, the decision maker focuses on incremental values and analyzes only those demonstrating the differences between the alternatives. According to Lindblom,^[17] the decision maker's "need for information on values or objectives is drastically reduced ... and his capacity for grasping, comprehending, and relating values to one another is not strained beyond the breaking point." The decision maker expects to have partial success with this decision, so he or she would expect to repeat the process endlessly, as they will be building on what has already been done. A major advantage of incrementalism is that it safeguards against errors, as the previous steps would have informed the decision maker of the possible consequences of similar steps.

Tarter and Hoy^[18] state that the incremental model has the following five distinctive features:

1. Means-ends analysis is inappropriate, because objectives and alternatives emerge simultaneously.
2. Good solutions are those upon which decision makers agree regardless of objectives.
3. Options and outcomes are dramatically reduced by considering only alternatives similar to the current state of affairs.
4. Analysis is limited to differences between the existing situation and proposed alternatives.

5. The incremental method eschews theory in favor of successive comparisons of concrete, practical alternatives.

The authors believe that incrementalism simplifies decision making, which does not make it whimsical.

Incrementalism is not without its critics. True^[19] articulates that despite incrementalism's widespread use, it has several flaws. They include the model's failure to provide comprehensive explanation of the expectations from policy and budget decisions; it says little about competition; it lacks a method to differentiate between incremental change and non-incremental change; it does not offer an understanding of value conflicts in the three levels of government when there is disagreement about who gets what; and it only gives a partial description of what really happens.

Lindblom^[17] stated that the model had several imperfections; for example, the model did not have built-in safeguards for the relevant values; and that several important policies might be overlooked, because steps taken earlier may not point in their direction. Despite the shortcomings, incrementalism has remained the dominant model used to understanding government decision making since its introduction in the mid-1960s.^[20]

TRANSFORMATIONAL CHANGE

Why would an organization choose to change its operations, and what factors would determine the type of change an organization should undertake? This question can be answered in a variety of ways. Most organizations do not voluntarily change their operations; and change does not occur by chance. Instead, organizational change occurs in response to some phenomenon from within or outside the organization or both. Organizations may undergo change to deal with inertia, chart a new course for the organization to follow, introduce new technology or handle some unexpected outcome. In addition, shrinking budgets, increased demands for improved services, and pressure from clientele may force management to do things differently to deliver better quality services.

Organizations are susceptible to many factors, as they do not operate in a stable, protected environment shielded from internal and external pressures. Notwithstanding, many organizations resist change because management may see the system as being stable. According to Kiel,^[21] "When change is desired, demanded, or inevitable, changing such a stability creates wrenching situations for employees and management."

Management scholars no longer associate order, stability, and consistency with the operations of

organizations. In fact, according to Kiel,^[21] public organizations operate in a non-linear and dynamic system full of surprises. Consequently, in response to turbulence in the organization's environment, an organization may be forced to change.

Jurow^[22] defines transformational change as "doing something different by creating new structures and new processes to fit a new objective." It necessitates a change in the status quo and the creation of new frameworks unmistakably different from what existed previously. The typical view of organization transformation theorists is that the process is a "holistic, ecological, humanistic approach to radical, revolutionary change in the entire context of an organizational system."^[23] Some theorists believe that organizations do not deliberately implement transformational change and that the change may be crisis-driven and necessary for the organization's survival.^[24] However, some organizations may change, because it is rational to do so. Dyck^[25] found that transformational changes based on value-rationality and not the status quo were the most likely to be implemented.

The literature on organizations provides different theories on how organizational change takes place. However, Sastry^[26] postulates, "Despite the important theoretical and practical implications of understanding organizational change, the organizational processes involved in transformational change have not been fully explored." Porras and Robertson^[27] concur and articulate that the theories' failure to fully explain the dynamics of the planned change is a major weakness of the field.

It is difficult to disagree that theories have not fully explained the implications of organizational change. However, Kiel^[21] articulates several principles drawn from non-linear dynamics that can provide public managers with insights into the dynamics of transformational change. There are three essential processes in transformational change. First, there will be fluctuations within the organization, and they should not be viewed as negatives, because these fluctuations can drive and energize the change process in the organization. The unusual behaviors that occur within the organization encourage the search for new problem-solving methods and service provision.

Second, managers should be aware that there would be instability within the organization. This, however, should serve as a prerequisite to change, thereby allowing the appropriate responses to environmental demands. Managers must exercise caution when dealing with instability, as only a certain level is required to realize the potential for change.

The third essential process in transformational change is disorder. This element is critical, as it facilitates the exploration of several possibilities that may lead to new operating procedures or new structures or both.

Like any other process, transformation change may fail to have the intended impact on the organization. Backer^[28] identifies management's failure to address the human side of the organization as a major factor. Managers shepherding transformation change in organizations must involve all employees in the process, as "Personal change is the prerequisite to organizational change... organizational transformation occurs one individual at a time."^[28]

CONCLUSION

The presence of fluctuations, instability, and disorder signals the formidable challenge that confronts public sector managers during the change process. These processes are neither surprising nor unexpected, because public agencies function in a non-linear environment fraught with uncertainty, chaos, and unintended consequences.

The process of change may present agencies with a seemingly insurmountable challenge. Notwithstanding, both management and other employees must have the discipline to facilitate emerging procedures and structures. A successful transformed public agency would benefit employees and clientele in several ways. Nutt and Backoff^[29] articulate that such agency would be able to serve a greater variety of clients in several new ways and improve the efficacy of the agency's operations.

Decision Making, Open System and Non-Equilibrium

Keith Carrington

*Criminal Justice and Legal Studies Division, St. John's University,
Jamaica, New York, U.S.A.*

INTRODUCTION

Making decisions is a normal part of our daily routine. Most of our decisions are made with very little processing or reviewing of alternatives and their consequences. While we make most decisions singularly, we, however, do not act as individual decision makers on all matters affecting our life. There are instances when we make decisions as members of a group. Whether we are involved in the decision-making process as individuals or members of a group, many of the decisions we make have far-reaching consequences.

Decision making is an important organizational function. It is important to public sector organizations because of their important social function. In organizations, individuals and groups make decisions. Many of these decisions not only affect the lives of the agency's clientele but also determine the organization's viability. Not long ago, decision making in organizations was considered the domain of the upper echelon. This notion has since been dispelled with the realization that workers at all levels are involved in the decision-making process. At the lower levels of an organization, decisions are made routinely about operational and other job-related issues. At the upper echelon, however, decision making takes on an additional element as managers deal with complex problems that require a high level of expertise.

Decision making is a "rational, deliberate, purposeful action, beginning with the development of a decision strategy and moving through implementation and appraisal of results."^[1] The process consists of three important elements: intelligence, design, and choice. Intelligence involves scanning the environment and arriving at a decision point. The second element is design, which involves developing alternative courses of action. Finally, choice is selecting the alternative with the best chance of success.^[2]

Many types of decisions are made in organizations. These decisions can be placed into two categories: programmed and non-programmed decisions. Programmed decisions are made in response to recurring, predictable problems. Decision makers respond to recurring problems by automatically implementing performance programs worked out beforehand (see Fig. 1). Performance programs are standard procedures

of behavior that employees follow. An organization may have several performance programs, as some problems may recur. Many programmed decisions evolve from non-programmed decisions implemented to deal with problems that occurred earlier.^[2-4] These programs are not "written in concrete," and should be reviewed to determine when changes might be necessary.

There are advantages to using programmed decisions. First, time is not wasted searching for information to develop responses to problems that are predictable and recur frequently. Second, these decisions allow the decision maker to respond quickly to threats or problems from the environment, which, if not resolved promptly, could lead to negative consequences. Third, programmed decisions allow decision makers to implement specifically designed strategies, thereby avoiding errors in the decision-making process.

Non-programmed decisions are the second type of decisions. These decisions address novel, unstructured, complex, and non-programmable programs encountered for the first time.^[2-4] This type of decision making requires superior skills and expertise. Decision makers follow particular steps that may include: identifying the problem; collecting information; examining alternatives and consequences; selecting a course of action; implementing the decision; and evaluating.

Framing a strategy to address a novel problem is not an easy task. Two points are worth mentioning. First, decision makers must accurately identify the problem, which would make the underlying causes unambiguous. This minimizes errors in framing and selecting an appropriate response. Second, decision makers must know the upper and lower limits of the decision. According to Sorenson^[5] and Starling,^[6] the upper limits are as follows:

1. The limits of permissibility (Is it legal? Will others accept it?).
2. The limits of available resources.
3. The limits of available time.
4. The limits of previous commitments.
5. The limits of available information.

The lower limit of a decision "refers to what, at least, must occur for the problem to be solved."^[6] The lower limits inform the decision maker of the

Fig. 1 Programmed decision response to recurring problems.

necessary factors that must be present for the decision to address the problem or situation identified.

There are several decision-making models, which give decision makers an array of choices. A few of the models are listed below:

1. Incrementalism.
2. The Rational Actor Model.
3. The Organizational Process Model.
4. Government Process Model.
5. The Administration Model (see *Decision making, Incrementalism and Transformational Change* for a discussion of these models).

No model has been proffered as the “one best” model for decision making, and the use of a model does not guarantee success. The best model would be the one that resolves the problem, and it may comprise elements from several models. Adhering steadfastly to one approach to make a decision may preclude the successful resolution of a problem. Tarter and Hoy^[1] remind us,

None of the models is a substitute for reflective thinking. None should be used rigidly as to prevent the recognition of an elegant solution in search of a problem ... When models are depicted in diagrams or schemata, it is tempting to view them as lock-step procedures to follow blindly. This is wrong as seeing all decision making as so idiosyncratic as to deny patterns.

Many of the models provide a theoretical approach to making decisions. Many scholars and practitioners propound that some models project a “cookie cutter” approach to decision making, and many of their features have very little applicability to real-world decision making. The lesson for decision makers is that while the models provide guidelines, there are differences in how decisions are made in the real world. This criticism is not sounding the death knell for the models, as several of their premises are used in real-world decision making. Real-world decision making offers decision makers several important lessons. First, government’s most important decisions are made by groups of people and not individual decision makers

working alone. Second, decision making is not a completely rational process. Third, people involved in the decision-making process possess different levels of analytical skills. Fourth, there are real limitations to applying strict analytical methods to all aspects of any problem.^[6]

While Simon advocated rationality in the decision-making process, Allison and Lindblom’s work shifted the focus to the influence of environmental factors on the decision-making process. This shift showed organizations not as isolated units concerned with only internal factors, but entities subject to the influence of the environment.^[7]

OPEN SYSTEMS

The open-system perspective has some of its roots in the intellectual ferment that emerged shortly after World War II. The works of von Bertalanffy^[8] fostered interest in open systems by showing that systems theory could be applied to many entities, including organizations.^[9] The system’s perspective views an organization as a complex entity with several intertwined and interconnected elements that continuously interact with the environment.^[10] Open-systems organizations are “systems of interdependent activities linking shifting coalitions of participants; the systems are embedded in—dependent on continuing exchanges with and constituted by—the environments in which they operate.”^[9] An open-systems organization not only has interchanges with the environment but also needs the vital interchanges to maintain its viability.^[11]

Organizations are open systems because of their energetic input–output system, interaction, and dependence on the external environment. Organizations were not always considered open systems. Before the application of the open-systems perspective, social scientists used one of two approaches to examine social structures. First, they regarded the structures as closed systems and applied the laws of physics and ignored environmental factors. The second approach endowed a self-determining concept to the structures and attributed their functionality to some magical purposiveness.^[12]

In a closed system, each part contributes to the overall working of the organization, the primary concern is efficiency, and the agency is considered insulated from environmental influences. The organization then is in full control and therefore focuses on functionality. Taylor's scientific management and Weber's concept of bureaucracy are examples of such systems.^[7,9,13]

In contrast to closed systems, where structures were thought to be relatively self-contained and independent, the open-systems perspective views the organization as acutely dependent upon the external environment. The organization has continuous exchanges with the environment. It uses the energy and materials from the environment to produce goods and services that are delivered to its clientele. Such organizations are susceptible to challenges and uncertainties, as managers do not possess full knowledge of the factors that could influence the organization's functions or have the ability to predict and control the factors that can influence the organization.^[12]

Notwithstanding the perilous environments that are fraught with formidable challenges, the open-systems organization continues its relationship with the environment, which is crucial to its survival. This interaction can facilitate organizational adaptation and change. Failure to change can lead to an organization's demise. Neumann, Jr.^[14] articulates that the major challenge facing modern organizations is how they could effectively adapt to their rapidly changing environments. He argues that modern organizational structures have been devised throughout history to meet the demands of the increasingly complex external environments, and expounds:

As with species that fail to adapt to changes in their environmental niches, so too non-adaptive organizations do not survive. The key to coping with external environments generally requires that the created structures of the organizations be compatible with the existing dynamics of the external world. Such a fundamental requirement should be intuitive, but in practice, many organizations appear not to understand this necessity.

Trist and Emery^[15] concur that some type of adaptation or evolution is necessary for an organization to survive in an increasingly turbulent environment. They believe that the evolution to open systems benefits the organization. Heckman^[16] also agrees that adopting an open system "maximizes the flexibility and adaptive potential of all its members..." thereby allowing the organization to sustain itself in a turbulent and challenging environment.

How can a complex organization adapt and sustain itself in an unpredictable environment? Philip Selznick's^[17] study of the Tennessee Valley Authority

(TVA) provides insights into some of the methodologies employed to deal with environmental threats. His work on the TVA outlined an open-systems approach to organizational analysis. The analysis emphasized the importance of the relationships between the organization and its environment. The study highlights the intricate system of relationships, which is important to an organization's stability and continuity. These relationships emerge as organizations endeavor to meet their needs and handle numerous problems.

One focus of the study was on the major strategic decisions to deal with threats in the environment. The mechanism used to handle environmental threats was co-optation, which safeguarded the organization and built relationships with social forces in the environment. For example, the TVA leadership co-opted the agricultural leadership—a threat from its environment—into its policy-making structure. The goal of this strategic move was to glean support for the organization's policies. Despite the benefits that could redound through the open-systems approach, many organizations attempt to operate in a closed system. This choice may be foolhardy, as organizations pursuing such isolation never achieve their goals.

NON-EQUILIBRIUM

One view of organizations is that they operate in a state of equilibrium for a very long period, where activities would be consistent with their dictates and structures. Public sector agencies are seen by some as examples of organizations striving to maintain equilibrium through stability. Some scholars regard stability and equilibrium as the "normal" and preferred conditions of organizations.^[18] Stability does not prevent change. Occasionally, punctuated change is made incrementally to maintain equilibrium. Some believe that the quest for equilibrium is dysfunctional and could lead to an organization's demise.

An opposing view is that organizations function under non-equilibrium conditions, and due to the environmental threats, are constantly adapting to sustain themselves. Non-equilibrium conditions are seen as prerequisites for an organization's growth and adaptation.

Limerick, Passfield, and Cunnington^[19] stated that the field has seen stable, incremental change and rapid organizational change. They reconcile the two types of changes by proffering Gould's model of "punctuated equilibrium." He stated:

Speaking most generally, our usual concept of time and history, abetted by traditional gradualism, views change as continuous and intrinsic, and structure as a temporary incarnation of the moment. The alternative

view, the basic vision underlying catastrophism, if you will, sees stable structure and organization as the usual state of things, and change as a rare and disruptive event provoking rapid shifts from one configuration to another. I believe that we are now witnessing, in field after field, a growing recognition of this punctuational style for change at all scales (cited in Limerick, Passfield, and Cunningham).

This perspective advocates that there are long periods of equilibrium punctuated by short periods of non-equilibrium, which resulted in the reconfiguration of organizations. Some believe that equilibrium and non-equilibrium conditions are interrelated.^[19]

Not all scholars and practitioners support the concept of punctuated change. Many believe that the unpredictable environment creates the non-equilibrium conditions in which organizations operate. Many suggest that non-equilibrium conditions prevail in an unpredictable, uncertain and, according to Doyle,^[20] “an unforgiving and, at times even hostile environment.” These conditions, which are fraught with pitfalls, compel organizations to change. Arthos^[21] articulates that non-equilibrium conditions have emerged as one of the natural features of open systems, and the non-equilibrium conditions encourage ongoing attempts to transform organizations. These transformational change attempts are made frequently; however, most of these attempts are rejected.^[22]

The equilibrium paradigm no longer holds firmly in the public sector. Practitioners and scholars now acknowledge the non-linear nature of public sector organizations and the instability and turbulence these organizations confront.^[18] These conditions present a formidable challenge to public agencies in their quest to deliver services. Government agencies are open systems, as they extract (taxes and fee) and release energy (services) through interaction with the environment. There may be demands from citizens and employees for a different method of service delivery. These pressures may force the organization to develop a novel service delivery.^[23]

The non-equilibrium perspective views the public administration environment in two ways. First, the environment comprises a mosaic of organizations at different stages of their evolution. This montage contains declining, self-regulating, and extremely unstable organizations; the latter may experience symmetry breaks and novel reconfigurations. The second view holds that the intrusion of politics on administration can enhance instability, which may lead to symmetry-breaking behavior. He argues against the politics/administration dichotomy, because politics may be needed to push public sector organizations beyond stability. Consequently, politics and administration must be inexorably linked.^[18] The non-equilibrium

conditions in which public sector organizations function demands continued renewal and change to remain viable. To ensure survival, it is necessary for organizations to change to continue operations in a non-linear environment.

NON-EQUILIBRIUM THEORY

Change is an accepted feature of organizations, and knowledge of the change process is important to practitioners and scholars. It is, therefore, important that the explanatory models used should be appropriate to bring to light invaluable lessons. Incremental and equilibrium models are still being used to explain how organizations change to adapt to their environment. However, these models give only a variation on the issue. Due to the non-equilibrium conditions and chaos organizations encounter while interacting with the environment, these models do not properly explain the change process. These models have failed to encompass the complexity of development of social systems and do not “incorporate those instances when wholesale, dramatic system changes occur.”^[18]

The inability of models to explain the changes that occur highlights the need for a new approach. Kiel^[18] proffers non-equilibrium theory, which he believes would provide an in-depth understanding of the evolutionary nature of the “process of change in which instability, disorder, and unpredictability serve as the central features in the development of new forms organization and complexity.” In addition, the theory gives insights into the change process leading to new configurations and can complement incremental models, thereby elucidating the entire evolutionary processes in systems relevant to public administration.

CONCLUSION

The cataclysmic events of September 11, 2001, underscore the unpredictable and perilous environmental conditions that can befall public and private sector organizations. The fallout from the events has affected all sectors. This has demonstrated several important lessons. First, organizations cannot isolate themselves from their environments. Even if they are not affected directly, ripple effects from turbulence in their environments could have an impact on an organization's overall performance. Second, although the September events are not typical of the environments in which organizations operate, they indicate that organizations would always face uncertainties and challenges. Third, change and adaptation must be a feature of organizations if they are to survive and remain viable in non-equilibrium conditions.

Many may argue that an open-systems organization is better equipped to deal with environmental threats. An advantage a decision maker has in an open systems organization is that he or she can use several methods to achieve the organization's goals; which is a defining characteristic of open systems.^[12] Kast and Rosenzweig^[24] argued that the dichotomization of systems has led to the belief that open systems are good, and closed systems are bad. They, however, believe that most social organizations are "partially open" and "partially closed," and that both approaches could be used under certain circumstances.

Decision Making, Rational

E. J. Woodhouse

Science and Technology Studies, Rensselaer Polytechnic Institute,
Troy, New York, U.S.A.

INTRODUCTION

In everyday life, an action is considered rational to the extent that it embodies good sense, including logic, proportionality, and appropriate fit with its context. In the mid-twentieth century, however, the term “rational decision making” came to be appropriated by systems theory, multiattribute utility analysis, and other hypercognitive approaches to figuring out what to do in complex situations. This article summarizes aspects of that specialized usage but also points to many other traditions of political thought that contribute to understanding the requisites for reasoned social choice.

Complex, ideologically contested choices typify governmental decision making, and analysis alone cannot determine how to cope sensibly with such situations. Calculation can assist in negotiating viable policy, but cannot take the place of ordinary reasoning and political deliberation. Hence, fairer and wiser governance depends on improved political processes more than on better analysis, and I argue for reappropriating the term “rational” so as to recapture its underlying spirit and refocus on the political.

This article analyzes aspects of that usage in the context of other traditions of thought bearing on reasoned social choice. I argue for reappropriating the term “rational” so as to recapture its original spirit.

CALCULATION AS PART OF POLITICS

In everyday usage, the term “rational” typically contrasts a reasoned mode of thought or action with one that is “irrational,” in the sense of being unreasonably distorted by emotion, bias, or ideology. Thus, a housing bureaucrat asks others in his profession: “Is our only choice between ‘solutions based on cool, rational decision-making by the experts’ and solutions based on the ‘passions’ of a mobilized mass movement?’” His answer, of course, is that “Rational decision-making in the production and rehabilitation of affordable housing is not incompatible with community organizing and direct action.”^[1] Likewise, working within a commonsensical meaning of the term is a professor at the Royal Military Academy in Brussels, Belgium, advocating what he calls “rational military

decision making,” choices that are “both ethical and efficient.”^[2]

The first systematization of rational decision making in political science was Dahl and Lindblom’s *Politics, Economics, and Welfare*, which drew on a long tradition of political thought recognizing that “Discussion is perhaps the oldest and most universal process for facilitating rational calculation in social action.” They analyzed “an extensive variety of social processes that facilitate rational calculation,” including two contrasting approaches to reducing the number and complexity of variables: quantification and delegation.^[3] Sensible collective action, they were saying, depends on a diverse combination of methods, some analytic and some social, and these methods typically intertwine, as when tasks are delegated to experts.

More generally, a variety of social science scholarship clarifies barriers facing intelligent collective action while illuminating possibilities for circumventing or lowering those barriers. Building on the old saying attributed to Clement Atlee, “He who controls the agenda controls the meeting,” research on agenda setting arguably attacks one of the most important barriers to intelligent governance.^[4–6] Even more fundamental than governmental agenda setting are the psychological, sociocultural, and political processes by which people come to frame how they think about issues.^[7,8] If the attack on Pearl Harbor inherently constituted an act of war, then launching World War II against the Japanese was a foregone conclusion, and there merely remained a few details about how to do it. In contrast, if international relations theorist Bruce Russett was correct in determining that Pearl Harbor did not constitute a clear and present danger to U.S. national security, then a much wider array of options might usefully have been considered.^[9] Framing is key.

Social and political psychologists who study conflict resolution and group and organizational choice observe situational factors leading to patterned, less-than-intelligent behaviors such as groupthink.^[10] Among the approaches offered to ameliorate problems that are complex and ill-structured and which change as problem solving advances, there is “double-loop learning.” This emphasizes learning to change underlying values and assumptions^[11] by interacting with others to induce questioning of one’s “theory of

action,’’^[12] resulting in better acceptance of failures and mistakes, yielding a more realistic approach to problem solving.^[13,14] Much of the voluminous literature on organizations bears on improving their functioning and, hence, on rational decision making.

ENTER HYPERRATIONALITY

The mix of analysis and politics assumed in the bulk of social science scholarship on decision making is not well reflected in the treatments of decision theory with which the label “rational” has been most closely associated for the past several decades. Hyperrational decision approaches attempt to describe and sometimes prescribe how individuals (or groups making a joint decision) do and should choose among alternatives in accord with their preferences and understandings.

The basic elements of utility theory were initiated long ago by Bernoulli,^[15] Bentham,^[16] and Pareto,^[17] and translated in the mid-twentieth century to the goal of maximizing “expected utility.” That sounds sensible, but operationalizing the intention turns out to be pretty difficult, as some critics recognized quite early.^[18] Step one in figuring out the expected utility of an action typically is to multiply the probability of a predicted outcome by the utility of that outcome. Because most political actions produce multiple outcomes, step two is to add the utilities of all the outcomes. That sounds cumbersome, but it is not too bad until one realizes that political participants hardly ever really know the probabilities or the utilities, which begins to undermine one’s confidence in the whole operation. The hyperrationalists are smart folks, of course, so they have partial responses to these problems; at bottom, however, the dividing line between the hyperrationalists and most social thinkers is that the majority just does not buy the basic story that utility maximization is possible or that it can be achieved via calculation.

von Neumann and Morgenstern’s^[19] work on game theory sometimes is considered a starting point for contemporary formal decision theory, but attention to ways of dealing with risk and uncertainty go back much farther through Charles Knight to earlier economists, including Marshall. Luce and Raiffa^[20] popularized the term “decision theory,” and Raiffa^[21] formalized a workable approach to “decision analysis” on which continuously refined work continues on topics such as revealed probabilities and the structure of individual utility functions.^[22] Cost–benefit, risk–benefit analysis and probabilistic risk assessment were offshoots, the latter focusing on probabilistic analysis of risky endeavors, such as nuclear power plants.^[23]

Rational decision advocates often attempt to break choices down into a series of steps: define the problem, identify criteria, weight the criteria in terms of their relative importance, generate alternatives, rate each alternative on each criterion, and “compute the optimal decision.”^[24] There may have been a time when some analysts were naïve enough to assume this process unproblematic, but most now recognize lots of problems with it. Because human memory and other cognitive capacities are so limited, we proceed by bounded rationality, meaning we tend to focus on just one or two criteria instead of the full range that might be sensible.^[25] Criteria are tough to compare, and relative importance depends on the situation: lower taxes are attractive, but at the expense of driving science teachers into industry? How often does one actually know the probability that a given action will have a given effect? And what about unintended consequences?

Emotion and interpersonal cuing tend to be extremely important to most humans, and trying to squeeze it all out of decision choices actually can lead to counterproductive outcomes. Thus, probabilistic risk analysis was deployed with great skill at high expense by nuclear power advocates, but many people just did not feel comfortable with giant power plants that could suffer even a small risk of catastrophic meltdown.^[26] Even economists are increasingly questioning their field’s conventional assumptions about human choice.^[27,28] Thus, it no longer is weird to read in the *Journal of Economic Literature* that:

Because we are social animals, the collective behavior of humans must be understood in terms of the cultural forces at work. World views, mores, taboos, and sanctions are among the social influences that shape and guide our behavior, so much so that characterizing our activities as “choice” and “decision making” is often inappropriate. This is no less true in market settings than it is elsewhere.^[29]

Behavioral Decision Theory or Heuristic Judgment Theory is generally regarded as a more realistic approach to understanding human choice, in part, because it is based on empirical observation of the guidelines and heuristics people actually use when they make decisions.^[30] For example, when particular images are highly “available” cognitively (World Trade Center collapse, shark attack, fire), people’s thinking will be more influenced than when dangers are less vivid (flood, radon in the basement, stress from gradually accumulating sleep deprivation). Individuals, groups, and organizations depart rather significantly from the choices experts say would be most in line with real-world probabilities.^[31] We have weak capacities for estimating probabilities and general cognitive limits for processing information.^[32] Simon^[33] argued that

making a choice that is good enough, satisficing, usually makes more sense than trying to optimize; and in everyday practice, this certainly is how most humans and their organizations behave (when they behave sensibly, which, of course, is far from routine). The psychology-based approach, therefore, is more helpful in understanding real life than are the various cognitive approaches derived from conventional economic assumptions about “rational man”; but the psychological approach also promises a good deal less than does rational choice (for a direct comparison, see Ref.^[34]).

RATIONAL CHOICE

Differing substantially from these policy-analytic endeavors is Rational Choice Theory, founded in part by Arrow,^[35] Downs,^[36] Buchanan and Tullock,^[37] and Olson.^[38] Practitioners of rational choice are generally concerned with understanding rather than with prescription and focus more on political behavior than on the substance of public policy. But, their approach was the most prestigious and rapidly growing part of political science in the last quarter century, colonizing many subfields of the discipline by drawing on economists’ simplifying assumptions about human behavior. So, one cannot speak of rational decision making without taking rational choice theory into account.

Rational choice begins with simple assumptions about individuals having incentives to maximize income, economize on time, and otherwise get what they want, and it attempts from this microfoundation to develop understandings of why people and institutions function as they do in politics. Blending with game theory in some hands (e.g., Ref.^[39]), analysts attempt to show why most of what happens in politics is “rational.” For example, whereas most observers of Congress perceive many different factors influencing assignments of legislators to committees, rational choice theorists try to demonstrate an underlying cause: committee assignments maximize the probability of policy outcomes that suit the majority of legislators in each party.^[40]

Despite widespread professional admiration for the theoretical rigor, most social thinkers find the assumptions used so simpleminded as to undermine the believability of the claims. Moreover, practitioners of rational choice have devoted far more effort to refining their theorems than to empirical tests of their ideas.^[41]

COPING WITH UNCERTAINTY AND DISAGREEMENT

Another way to tell the story of the “rational-comprehensive” approach in decision theory is to

emphasize not its intellectual but its cultural roots.^a The receptivity to calculation as a substitute for political interaction stems from its compatibility with the mastery tradition in western thought: Techniques to conquer uncertainty have long been popular, manifested in the physical sciences and engineering as well as in religion.

Lindblom systematized and effectively debunked the folk theory of rational-comprehensiveness in “Muddling Through” and subsequent work, showing that rational-comprehensive aspirations make impossible demands for information, causal theory, time, and other resources.^[43–45] For example, as Alice Rivlin put it, “Little progress has been made in comparing the benefits of different social action programs,” and “little is known about how to produce more effective health, education, and other social services.”^[46]

Fortunately, although there is no way to calculate the “correct” approach to a complex policy issue or to analytically set the agenda or to even define what “the problems” are, political participants declare what they consider the high-priority problems, and they propose solutions. Such proposals are never proven superior to other possible problem definitions, agendas, and policy options, but fortunately, proof is unnecessary, because action is undertaken when a working majority reaches agreement.

Can mere agreement really be considered an intelligent way to run a society? To evaluate that, one needs some way of judging what constitutes an “intelligent” political process. No one has a definitive set of criteria for that, but many people might look for at least the following:

1. That concerns moderately or strongly held by any sizeable number of people are taken into account in some non-trivial way.
2. That reasonable tradeoffs are made among conflicting values.
3. That, insofar as feasible, policy actions take into account available information about social problems and opportunities, performance of existing programs, costs, and other relevant matters.

Although no political system is presently designed to achieve these elements of intelligent policy making nearly as well as can be envisioned, it turns out that negotiations and other adjustments among political partisans can often achieve a measure of all of these goals. How? Consider some of the ways partisans are likely to think about making and responding to policy proposals:

1. In crafting a proposal, partisans will tend to look for ways to get what they want without

^aThis section is drawn largely from Ref.^[42].

stirring up adverse responses or retaliations from others. So, the search for agreement simultaneously becomes a method of taking diverse views into account.

2. Knowing that they will need allies when putting forth their own proposals, others are disposed to grant what proposers ask, unless there is some good reason not to do so. Thus, a bias toward action is built into the system: I will help you get what you need, if you will help me get what I need.
3. Those with initial objections have strong motivation to come up with counterproposals, ones that will allow them to join with the original proposer in seeking a mutually beneficial outcome.
4. The need to win agreement keeps demands within the sphere likely to be considered “reasonable” or intelligent by most of those whose agreement is needed.
5. Moderation likewise is encouraged, because those putting forth a proposal will be wasting their own scarce time, energy, and other resources if they cannot win agreement; and, even if eventually winnable, immoderate proposals may not be worth the effort and the favors used in the process.

Thus, working for their private gain and for their vision of the public interest, partisans interact with each other in ways that often converge toward fairly sensible outcomes. The need to achieve agreement leads to policy making that, to some degree, aims for the three goals of responsiveness to public sentiment, sensible trade-offs, and attention to relevant information.

These interactions can be thought of as substituting politics for analysis, because no one really “understands” the social problem that is being ameliorated, inasmuch as the participants each hold somewhat different definitions of the problem. Alternatively, political interaction can be said to achieve a form of understanding that cannot be produced through analysis alone. Because understanding is generally sought as a means to improved action, whenever a working majority agrees on a new or revised policy, that policy can be thought of as embodying a new understanding. This accords with one definition of the term understanding: a shared agreement.^[42]

It is not clear that anyone in the field now really advocates rational-comprehensive techniques as the primary method of approaching complex public issues, but various scholars dissatisfied with incrementalism tried to formulate second-best approaches seeking to preserve some of the aims of comprehensive analysis,

such as making sure that important priorities are not overlooked.^[47–49] Despite all the attention to incrementalism and to Simon’s work on satisficing, despite the fact that most policy scholars got the point, those who understand analysis as an adjunct to politics perhaps have not done as well as the hyperrationalists at advancing a systematic program of conceptually and empirically refined research.

However, one strand of qualitative decision theory has built a research program around the fact that social problem solving ordinarily proceeds through trial-and-error learning. How can policy analysts help partisans figure out how to make the inevitable errors less damaging and how to learn from them more rapidly? Three of the main pitfalls in ordinary trial-and-error learning are as follows: 1) a policy trial may produce unbearably costly outcomes; 2) policy moves may retain too little flexibility, preventing errors from being corrected readily; and 3) learning about errors may be very slow. More intelligent trial and error would feature strategies for making errors less costly, for building in greater flexibility, and for speeding up the learning process.^[26,42]

Even in highly uncertain endeavors, it is often possible to partly foresee and protect against some of the worst risks, as the National Institutes of Health did in requiring early biotechnology research to be conducted in special laboratories, sealing in potentially dangerous new organisms.^[50] To prevent policies from becoming deeply enmeshed in implementers’ careers and otherwise resistant to change, in framing policy moves, partisans and analysts can improve their odds of success by developing policy options that can be altered fairly readily, should unfavorable experience warrant. For example, flexibility is higher when a policy’s costs are borne gradually, allowing expenditures to be redirected as learning develops. NASA’s space shuttle illustrates the problem: A launch regime relying on expendable rockets would have been much easier to revamp.^[51,52]

Flexibility also can be enhanced by phasing in a policy during a learning period, a common practice in business; by experimenting in a limited geographical area or for a delimited client base; by conducting simultaneous trials of two or more alternative approaches; by using an existing bureaucracy instead of creating a new, dedicated organization with permanent staff; and by many other tactics.^[53–55]

The research on intelligent trial and error exemplifies a much broader body of policy-oriented scholarship aimed at understanding how to make collective action more intelligent without the simplifying assumptions typically necessitated by the hyper-rational approaches. The spirit of that endeavor is captured by Andrews’^[56] concept of “humble analysis.”

CONCLUSION

In sum, rational decision making is a sprawling topic not defined by any simple, bounded set of literature. The term is contested, with hyperrationalists influenced by economics tending to win disproportionate (but often unfavorable) attention from policy intellectuals and from participants in policy processes. Critics of cost-benefit analysis, game theory, and other purely analytical techniques have been on the defensive for several decades, in part because their techniques are much fuzzier and more difficult to teach and deploy.

But, the critics' intellectual case is convincing: analysis simply cannot be substituted for politics, and virtually no one really argues otherwise. As Johan Olsen put it, hyperrationalists "suggest an approach that assumes away most of the complexity of political actors, the organized settings within which they operate, and institutional change, rather than make a serious effort to understand that complexity."^[57]

For the future, it is safe to assume that one basic challenge will continue to confront those who care about bringing greater intelligence to bear in social problem solving. The potential intelligence of democracy primarily requires that social institutions and processes be arranged so that interaction among diverse persons can find areas of agreement that take into account a great many considerations bearing on each choice. This partially substitutes for rational calculation and partly uses analysis in the service of partisan goals. Yet, those who exercise political and economic authority generally are far more willing to utilize narrow techniques for improving efficiency than they are to improve and redefine effectiveness by listening to social scientists calling for social-organizational changes to broaden the sphere of negotiation and otherwise strengthen the decision-making process.

Hence, "the troubled attempt to understand and shape society" goes to the heart of power relations in contemporary civilization and is by no means a purely academic dispute.^[8] The quest for more intelligent or "rational" collective decision making goes well beyond the terrain conceivably covered by rational choice, cost-benefit, multiattribute utility theory, and other logico-quantitative techniques. Such techniques usually are not aimed at how issues are framed, and they are not aimed at many other factors that actually matter when policy negotiations and impositions are going on; hence, the analytic techniques sometimes called "rational decision theory" actually are most helpful when located within the much broader universe of social thought pertaining to intelligent choice. Rethinking rational decision making to make relevant a broader swath of scholarship in public policy, political science, and social thought more generally probably is essential for narrowing the substantial

discrepancy between aspiration and achievement in moving toward the potential intelligence of democracy.

Decision Making: Administrative Dispute Resolution

Becky A. Nesbit

Lisa B. Bingham

*School of Public and Environmental Affairs, Indiana University,
Bloomington, Indiana, U.S.A.*

INTRODUCTION

Administrative agency use of alternative dispute resolution (ADR) refers to the use of methods other than traditional adjudication, rule-making, litigation, or informal administrative action to resolve conflicts that arise in public administration. This article begins by describing traditional processes for addressing conflict in public administration. Next, this article overviews the most common dispute resolution methods and their potential benefits. Then the article discusses the development and sources of authority for administrative agency use of ADR in public administration as well as the pros and cons of administrative use of ADR. Finally, the article concludes by discussing the implementation of ADR programs and their evaluation in public administration.

CONFLICT RESOLUTION IN PUBLIC ADMINISTRATION

Public agencies have a variety of means to address conflict in making, implementing, and enforcing public policy at the federal, state, and local levels of government. These include traditional processes such as rule-making, adjudication, informal agency action, and litigation as well as various forms of ADR, such as interest-based negotiation, mediation, fact finding, binding and nonbinding arbitration, and other facilitated processes.^[1]

Administrative agency action can take forms analogous to each of the three branches of government; at times, agencies act in a quasi-legislative, quasi-judicial, or executive capacity. Quasi-legislative action includes the formation of policy through the development of guidelines or through informal or formal rulemaking leading to new regulations. The rule-making process is synoptic and prospective; it entails the collection and review of information and comment generally related to creating or fleshing out public policy, after which, the agency publishes draft regulations. Quasi-judicial action includes informal or formal adjudication or contested hearings to determine the rights of specific parties. Adjudication is retrospective; it

entails the creation of a factual record of past events related to the enforcement of existing public policy either in the form of a statute or regulation. Executive action includes the remaining broad swath of informal agency decision-making generally related to implementing public policy. Agencies can also initiate or defend litigation as part of the process of enforcing policy.

Administrative use of ADR includes three main types of processes—negotiation, consensual processes involving a third-party neutral, and adjudicatory processes involving a third-party neutral. In general, the disputing parties must voluntarily consent to its use before engaging in an ADR process.

Two kinds of negotiation fall under the rubric of ADR processes—principled (interest-based) negotiation and partnering. Principled or interest-based negotiation encourages separating the people or personalities from the problem and focusing on the interests in the case as a means of facilitating creative, mutually beneficial solutions.^[2] Partnering is a method of dispute avoidance involving a retreat and conflict management training before entering into a contract. Consensual processes involving a third-party neutral include facilitation, conciliation, mediation, early neutral evaluation, minitrials, and summary jury trials. In these processes, a third-party neutral guides the disputing parties in their search for a solution but cannot impose a binding decision on them. The most common adjudicatory processes are fact-finding, nonbinding rights or interest arbitration, binding rights or interest arbitration, and med-arb. In these processes, a third-party neutral decides the outcome after hearing the disputants' cases.

ADR in public administration can also help increase public participation in policy decisions (and other decisions) of government.^[1,3] In negotiated rule-making, a committee from the public, along with a professional facilitator, convenes and tries to reach a consensus about changing an agency's rule.^[4,5] Negotiated rule-making in environmental dispute resolution has been particularly successful because the decisions are more responsive to participants' values and are more substantively robust, although the range of participants is not always representative of the greater public.^[6]

Public agencies and organizations increasingly employ ADR processes to resolve conflicts. Proponents of ADR claim that it is a good complement to decision-making in public administration, partly because ADR processes are varied and flexible enough to fit into a wide variety of organizational settings.^[1] Conflicts in public administration encompass a wide variety of disputants, and therefore, vary greatly. Examples of conflicts in public administration include intra-agency disputes (such as those between employees and management) or interagency disputes (disputes between two or more agencies). In addition, conflicts can be intergovernmental or can occur between a government agency and one or more private organizations, or between a government agency and the people or institutions it regulates.

ADR supporters claim that ADR offers potential benefits of time and cost savings and more satisfactory and stable outcomes by avoiding costly and time-consuming litigation. In response to these claims, Congress passed several pieces of legislation to encourage public sector use of ADR.

AUTHORITY FOR ADR USE IN PUBLIC ADMINISTRATION

Before 1990, federal public agencies had indirect and implicit authority to use ADR through the Administrative Procedure Act (APA), which permitted settlement as a means of addressing complaints. Many agencies also had a general enabling statute that indirectly allowed them to use a variety of dispute resolution processes in resolving contractual disputes.^[7] Binding arbitration was more controversial and was prohibited outside of labor disputes by the comptroller general. Data are not available regarding how often agencies took advantage of this indirect authority to use ADR to resolve disputes.

Since 1990, Congress has encouraged the use of ADR in the public sector by passing several laws that provide the federal sector with direct, specific statutory authority to address disputes using ADR methods. The Civil Justice Reform Act of 1990 [28 U.S.C. §§ 471–482 (1994)] required the federal courts to decrease the costs and delays of litigation, specifically recommending the use of voluntary ADR to achieve this end and authorizing judges to refer cases to ADR. Because the federal government is the biggest single consumer of federal court services, this change resulted in greater use of ADR for litigated cases to which federal agencies were parties. The US Department of Justice has collected some data from assistant US attorneys on this use of ADR and determined that it saved time and money.^[8] Subsequently, Congress enacted the ADR Act of 1998 to require that each federal court adopt a dispute

system design, that is, a plan for integrating ADR into the administration of their caseloads [28 U. S. C. § 651 (2005)].

However, this authority applied on its face only to the federal courts. The Administrative Dispute Resolution Act (ADRA) of 1990, made permanent in the ADRA of 1996 [5 USCS §§ 571 et seq. (2005)], granted broad authority to the Executive Branch to use various ADR techniques. Congress found that the excessive cost and time of litigation justified the statute; it praised the efficiency of ADR methods and adopted a policy preferring ADR to litigation. The ADRA defines ADR as “any procedure that is used in lieu of adjudication as defined in the APA, to resolve issues in controversy, including but not limited to settlement negotiations, conciliation, facilitation, mediation, fact finding, minitrials, and arbitration, or any combination thereof” [5 U. S. C. § 571 (2005)]. On its face, the ADRA applies to processes used in lieu of adjudication, a quasi-judicial procedure for making decisions that affect public policy. In practice, the ADRA has also provided authority for quasi-legislative processes for making policy using collaboration and consensus.^[9] The 1996 amendments exempted confidential communications between the disputants and the third-party neutral from disclosure under the Freedom of Information Act. They also removed disincentives to use binding arbitration; specifically, in the previous version of the act, federal agencies could reject awards issued in binding arbitration within 30 days after their issue. By eliminating the right to reject an award, the revised statute made binding arbitration equally enforceable and final for both parties.^[10]

The Negotiated Rulemaking Act (NRA) of 1990, made permanent in the NRA of 1996 [5 U.S.C. §§ 561, et seq. (2005)], encouraged federal agencies to use negotiation with interested stakeholders to develop regulations before engaging in traditional notice and comment rule-making.^[3] This statute expressly authorizes the use of consensus-based processes for a quasi-legislative agency action to make policy. There is an ongoing debate about the efficacy of negotiated rule-making and what criteria ought to be used to assess its success, for example, the time it takes to adopt rules, the frequency of litigation challenging a final rule, or the satisfaction of stakeholders with the result of the process.^[9]

Federal ADR policy also evolved through presidential mandates. President Clinton requested the formation of the Interagency ADR Working Group in 1998 to coordinate and facilitate federal agency use of ADR.^[10] Through the Interagency ADR Working Group, federal agencies participate in at least one of five sections: workplace, enforcement and regulatory, claims, contracts/procurement, and the small agency caucus. The Working Group provides federal agencies

across the federal government with information about program design, training, identification of neutrals, and evaluation systems. More information about the Interagency ADR Working Group is available on their website (www.adr.gov).

State and local governments derive authority to use ADR in three ways: as part of their power to enter into contracts; through provisions of the State Administrative Procedure Act, or through express statutory or executive order authority to use some form of ADR.^[7,11] At least 25 states have some form of express authority for state or state and local agencies to use ADR (more information is found on the website of the Policy Consensus Initiative, www.policyconsensus.org). State executive orders and statutes require state agencies to familiarize themselves with ADR methods and to use them when appropriate. Local governments also have direct ADR authority through their police powers, contracting powers, and budgetary and legislative authority. Some local governments use local community mediation programs to address conflict in the public schools, for cases of juvenile delinquency (called victim-offender mediation) or for neighborhood disputes that would otherwise consume judicial resources (the classic barking dog case).^[11] More information about ADR use by local governments is available from the National Association for Community Mediation (www.nafcm.org).

THE PROS AND CONS OF ADMINISTRATIVE AGENCY USE OF ADR

Proponents of ADR argue that it saves time and money, results in improved relationships between parties to a dispute, enhances the exercise of voice by citizens and stakeholders in matters of public policy, and can yield outcomes that are both win-win and more creative than traditional win-lose processes. Some claim that ADR helps public administrators to avoid policy stalemates by improving communication between an agency and the public. Through participation, the public perceives policy decisions as more legitimate. There is a developing body of research assessing the evidence for these claims by using evaluation criteria including time to final disposition of a dispute, parties' assessments of their transaction costs, participant satisfaction, the overall pattern of ADR outcomes, changes in parties' conflict management styles, and systemic impacts such as complaint filing at the organizational level. (A comprehensive review of the growing body of evidence that ADR proponents can use to justify their claims is outside the scope of this article, but for a review, see Refs.^[11,12].)

ADR is not appropriate for every conflict to which an agency is a party. There are both concerns about

when an agency should use ADR and critiques about its impact on the perception and reality of government legitimacy, transparency, and accountability in public law and decision-making. For example, some argue that ADR gives special interests undue influence over public policy. Institutional repeat players have advantages in both repeated contact with agency representatives and greater resources to bring to bear on the process of policy-making. They argue that the agencies become more receptive to this one voice in the policy process (agency capture). Public interest groups argue that they cannot afford to participate in lengthy negotiations regarding a proposed regulation. Others suggest that consensus-based processes coopt advocacy groups and make them less effective.

There are also concerns regarding the impoverishment of public law and precedent. Some have argued against settlement; the classic example is what if our country's leading desegregation case had been mediated in private rather than decided publicly by the US Supreme Court? Moreover, mediation and arbitration are designed to be private, confidential processes that do not create precedent. This leads to criticism that decision-making is ad hoc, not transparent, and not subject to adequate public or judicial review.

In response to these concerns, many agencies are developing guidelines for ADR use. They are instituting processes to solicit the voices of stakeholders about program design. Lastly, they are instituting systems for evaluating the efficacy and quality of their ADR programs to continue to improve how they serve the public and the public interest.

IMPLEMENTING ADR IN THE PUBLIC SECTOR

Five years after the ADRA of 1990, a review of federal agencies' implementation of ADR found that each agency had implemented ADRA to different levels.^[13] Some agencies were using multiple ADR methods on a regular basis, while other agencies restricted themselves to fewer techniques. Lopsided implementation of ADR in these agencies can be explained by difficulties in amassing human and financial resources for implementation as well as difficulties in creating institutional pressures for implementation.^[14] By far, mediation was the most widely used ADR method, followed by early neutral evaluation. The least used methods were ombudsman programs, fact finding, and facilitation.^[13] Use has continued to grow in the federal government in particular.

As experience with ADR in public administration increases, it is possible to identify some important lessons public administrators have learned about the best practices for implementing an ADR program.^[11] First, the organization should systematically assess

how it handles conflict in the present system. The agency must identify the stakeholders, current processes in use, resources available to support their use, their outcomes, and how stakeholders view them. Second, good system design requires the participation of people who will be using the system: stakeholder involvement. Third, ADR is only an option if the system is designed to focus on the interests of disputants, or their underlying needs and concerns, rather than the more traditional focus on legal rights and obligations. Fourth, a key to effective ADR is giving disputants control over the choice of process for resolving conflict, the authority to resolve their own disputes, and the training and skill-building necessary to do so effectively.

Fifth, recent thinking supports the creation of integrated conflict management systems, that is, an overarching framework for all the grievance or conflict management processes in an agency. Such a system should have multiple points of entry, multiple options for addressing the dispute (fit the forum to the fuss), with processes available at the lowest possible level within the agency or organization. It should organize options from low to high cost, with relatively inexpensive processes for determining rights if interest-based consensual processes fail.

Sixth, the best-designed system can fail if the agency fails to implement it comprehensively. Effective implementation includes training, publicity, informational materials, point people as resources, goal-setting, outreach, intake, and monitoring use. It also requires top-down and bottom-up support. Leaders at the top of the agency should provide adequate resources and public support, and should use the program. People in the trenches should provide testimonials from satisfied participants, success stories, and newsletters, and build word-of-mouth on the street. Seventh, good implementation requires a system for monitoring and improving the program. Continuous data collection can help provide objective accounts of a program's function and point to ways to improve it. Stakeholder feedback is essential to a program's success. It encourages ownership, and if feedback is positive, this encourages others to use the program. It also identifies strengths and weaknesses. Objective data about program outcomes can help create internal support for budget and human resources.

Although ADR use in the public sector has increased dramatically, obstacles prevent full institutionalization. Key among these is the difficulty in demonstrating ADR success.^[13,15] More systematic data on program performance may enable an agency to overcome obstacles such as organizational inertia, scarce agency resources, unfamiliarity with the techniques, participants' fear of appearing weak if they use ADR, and skepticism about the ability of ADR to work.^[15]

CONCLUSIONS

The policy toward a greater range of dispute resolution processes encourages ADR over traditional adversarial and adjudicative process. Congress passed several laws in the 1990s authorizing and encouraging the use of ADR in the public sector as an attempt to reduce the costs and delay associated with litigation and to improve the outcomes. Public agency use of ADR is becoming increasingly common. Alternate dispute resolution methods include such techniques as mediation, arbitration, minitrials, facilitation, and other hybrid methods. ADR processes can be applied to intra-agency disputes, interagency disputes, intergovernmental disputes, and disputes between an agency and private organizations or citizens. Principles of good dispute system design are emerging. Public administrators need to acquire a deeper knowledge of the wide range of dispute resolution processes available as part of their substantive responsibilities and bring this knowledge to bear on improving administrative agency conflict management systems.

INTRODUCTION

This chapter provides a broad overview of bond default. It includes the definition of a bond default, an explanation of default vs. technical default, bond recovery, private municipal guarantees, and a history of bond defaults.

WHAT IS A BOND DEFAULT

Default risk is the chance that the issuer of a bond may be unable to make timely principal or interest payments. During a default, bondholders generally do not lose all of their principal value invested in the bond. In most cases, a default results in the deferral of the coupon payment. Bonds in default can be purchased on the secondary market at a discounted rate. These bonds carry significantly more risk but pay a higher return if the issuer successfully emerges from bankruptcy. If payment is not restarted or protected by bond insurance, investors are sometimes able to recoup their losses through the legal system, which can involve all parties in the default issue from the issuer of the bond all the way down to the underwriters.

DEFAULT VS. TECHNICAL DEFAULT

There is a notable difference between default and technical default. Default is a failure to pay in a timely manner, according to the covenants of the bond, principal and/or interest when due. This is often the result of a bankruptcy. A technical default is a failure by the bond issuer to meet the conditions of a bond agreement. Examples of technical default are failure to maintain required fund reserves or other capitalization requirements. Losses to the bondholder are not necessarily a result of a technical default. A technical default may be reversed by changes in policy or reparations made by the bond issuer. It may serve as a warning that a default is coming but if problems are resolved in time, default can be avoided. A technical default will often lower the price of a bond in the secondary market.

BOND RECOVERY

Bonds can recover from default in several ways. The issuer may make full debt service payments through other financing or liquidate collateral used to secure the bonds. Municipal service providers often repay accumulated debt when cash flows resume normal function. Physical assets that are public property and are never pledged to bondholders back this type of debt. Bondholders have an automatic lien on revenues until the entity is able to recover normal operations. The two sectors with the highest default rates, industrial development bonds and multifamily housing bonds are often backed by collateral leading to higher than average recovery rates.

PRIVATE MUNICIPAL BOND GUARANTEES

There are two main private sector options to improve a bond rating: bond insurance and standby letters of credit. Both affect the net cost of borrowing.

Bonds insurance, written by commercial insurance companies, can improve a bond issue rating. This is in addition to the pledge of security of the issuer's revenues. The insurance provides payment to the bondholders for the life of the issue if a default should occur. Municipal bonds that would qualify as borderline investment grade will often seek insurance to increase the issue's credit rating and reduce the cost of borrowing. Municipal bonds that are rated AAA because of their insurance protection will often yield more than an issue rated triple-A without insurance protection. Most insurance of bond issues take place at the initial issue while some take place in the aftermarket. In the aftermarket, insurance is purchased for only a portion of the bond issue. Bond insurance firms and banks providing private guarantees must maintain a credit rating of AAA.

Another form of guarantee is a standby letter of credit from a commercial bank. The letter is a pledge of the bank's credit to make principal and interest payments on the bonds if the issuer is in default. It is provided for a fee to improve the rating on the bond issue and drive down the cost of capital.

JUNK BONDS

“Junk bonds” are bonds that are rated below investment grade and carry the highest risk of default. The term “junk bond” comes from the low credit rating that drives the higher yields required to attract investors. The highest quality bonds, rated AAA, carry a low yield but also a low risk of default. The lowest quality bonds, rated BB through D, carry high yields but also high risk of default. Studies have demonstrated that portfolios of high yield bonds have higher returns than other bond portfolios, suggesting that the higher yields paid by junk bonds more than compensate for their additional default risk.

HISTORY OF MUNICIPAL BOND DEFAULTS

The history of municipal bond defaults in the United States closely parallels cycles of economic growth and westward expansion. During each major depression, most defaults occurred in the western regions. A period of heightened municipal borrowing and economic development preceded each depressionary period. Fluctuating land values, financial mismanagement, and unrealistic fiscal projections all have contributed significantly to bond defaults. The post-World War II period has seen revenue bonds as a new source of default mostly due to inaccurate revenue projections.

The default of \$2.25 billion by an association of local governments in Washington State, known as the Washington Public Power Supply System (WPPSS), is perhaps the most famous bond default in history. The associations’ nuclear-plant construction program collapsed in the early 1980s under the pressure of rising costs, high interest rates, and overestimated demand for electricity. Two of the five nuclear power plants to be built were financed mainly by tax-free municipal bonds. These bonds carried a higher interest rate than the federally guaranteed financing of the other three plants. The premium interest rate made the bonds attractive to investors but also carried a higher risk of default. Only one of the five nuclear-plant projects ever began operation. As the single largest single issuer of municipal bonds in U.S. history, the default sent shock waves through the bond market. The impact was so severe that new disclosure requirements were implemented by the U.S. Securities and Exchange Commission (SEC) to help prevent future defaults.

Another large default occurred in Orange County California in December 1994. Orange County Treasurer, Robert Rron, faced with strained financial conditions needed to enhance investment returns and leveraged the county’s investment fund using short-term

notes, repurchase agreements, and derivatives. The need was driven by the county’s unwillingness to raise taxes and other fiscal constraints. On the outside, the \$7 billion debt portfolio appeared safe as it contained U.S. government bonds with relatively short-term maturities. Upon closer inspection, it was revealed that these debt instruments were highly leveraged by repurchase agreements by private firms. Citron borrowed more than \$12 billion at low interest rates, using the pool’s securities as collateral, and invested the money in high-yield securities. This investment tactic proved highly profitable and earned above market returns. However, late in the summer of 1994, the investment scheme started falling apart as the Federal Reserve increased discount rates. Soon after the debt portfolio started showing sizeable paper losses and the private firms began to demand more collateral for their repurchase agreements, Orange County was unable to meet these demands. The demands to absorb a \$1.5 billion loss forced Orange County to file for bankruptcy protection.

CONCLUSIONS

Municipal bonds are generally considered safer than corporate bonds, since a municipality is less likely to go bankrupt than a corporation. However, there have been large defaults by municipalities that have forced significant losses on investors. Protection against default is available for a fee on some municipal bonds that are insured by the private sector and is intended to improve the rating of a bond issue and reduce borrowing costs. A technical default on a bond does not necessarily mean a financial loss to an investor as it can be remedied through fiscal changes. However, it can be considered a warning of a more serious problem with the finances of a bond issue.

Democracy and Public Policy

Dale Krane

Gary S. Marshall

Department of Social Sciences, Roskilde University, Roskilde, Denmark

INTRODUCTION

Any discussion of the definition, the attributes, or the purposes of democracy invariably entails a consideration of public policy. The two terms, although distinct and different, are closely intertwined. Democracy is a form of government and, as such, refers to a system of authority and power. Discussions of democratic theory revolve around the organization and use of political power within a society—who should govern, how they should govern, and for what ends or purposes they should govern. By contrast, public policy refers to a purposive course of action established by public officials that is binding on the residents of a community or nation. Simply put, public policy is what governments choose to do or choose not to do.^[1] Who exercises power or has authority to take actions binding on a community or a society will obviously affect what actions are selected or not selected. Likewise, the organization of authority will also shape its use as manifested in policy choice. Because of this link between form of government and performance of government, the theory of democracy, in Henry Mayo's^[2] words, "... is one answer to the question of how the political policy decisions are made and should be made."

DEFINITIONS OF DEMOCRACY

Since its emergence in Greek political thought, the literal definition of democracy, "rule of the people," has remained more or less constant. But how this simple two-element formula of *demos* (people) and *kratos* (power) is interpreted and translated into actual practice has been a major industry in political theory circles from Socrates and Solon to Rousseau and Mills to the multitude of today's theorists. Books addressing questions such as "Who are the people?," "Which people should exercise power?," and "How many people are required to make a decision binding on the community?" fill whole sections of libraries around the world. "Today the term *democracy* [italics in original]," Dahl observes,^[3] "is like an ancient kitchen midden packed

with assorted leftovers from twenty-five hundred years of nearly continuous usage." Yet, these definitional debates can be distilled down to the basic issue of identifying "... the best constitutional means of approaching the ideal, it already agreed that this ideal includes or involves a large participation of the common people in the forming of public policy"^[2] (as quoted by Mayo from Robinson, Richard: *Definition*. Oxford 1949, 166).

Much of the theorizing about democracy falls into one of two perspectives. For much of its history, democracy was conceived as a form of government applicable only to communities of relatively modest populations such as the Greek city-states or the Italian and Swiss cities of the Renaissance period. Within small-scale societies, the people, usually defined as the (male) citizens, formed the government, typically an assembly of the whole, and decisions of the assembly were binding on citizens as well as all other residents of the community. This theoretical position is often labeled as *direct democracy* and "... is principally concerned with ensuring democratic rights for the *community* as a whole." [italics in original].^[4]

Critical to direct democracy is the notion that citizens possess the capacity and the volition to govern themselves. Rule of the people requires "rule by the people," or self-government. Direct democracy rests on two core principles: 1) citizens are "sovereign"; that is, citizens make public policy and 2) each citizen is legally and politically equal to every other citizen. Also necessary to direct democracy are two important rules: 1) when unanimity does not exist among citizens, the preference of the largest number of citizens becomes public policy, and 2) freedom to express one's opinion about public policy is protected, and the majority may not "silence" the minority (though the minority must obey policy decisions until the decision is changed). Because policy decisions reflect the choice of the community, policy must be obeyed by all citizens, officials as well as non-officials. Furthermore, the processes of deciding and then administering public policies are legitimate only if the established procedures have been followed. That is to say, political power is limited by a set of rules as to how it will be exercised. Instead of

government by privilege or by force, government acts through popular consent.^[5] Direct democracy, it should be noted, is not immune to the problems commonly associated with the exercise of power such as the difficulties of 1) arriving at a community-wide consensus, 2) controlling conflict among citizens with different preferences, and 3) ensuring compliance with the collective decision.

As modern nation-states developed between the 1600s and the 1800s, rapid population growth and urbanization posed a significant challenge to democratic theorists. The sense that direct, communal democracy in a large-scale city or country was untenable became increasingly widespread. If it was impossible for each person to participate in the deliberation and choice of public policy in a large city or country, then democracy had to be redefined. It was crucial to find ways for citizens to control the government as well as to be protected from actions by the government that would lessen or eliminate “popular sovereignty.” Liberal ideas of representation were proposed as a solution, and rule by the people was redefined as the choice of one’s rulers.

The ideas motivating the revolutionary break from the medieval order strongly influenced the second perspective to democracy. Instead of democracy embodied in a community-wide consensus, “general will,” or “public interest,” democracy became associated with the revolutionary ideal that each person, to quote Thomas Jefferson, has “certain unalienable Rights.” If the people were to rule, then each person had to be guaranteed the exercise of certain rights such as belief, speech, assembly, and representation. Likewise, certain limits had to be established beyond which the community could not impose its will on the individual (NB: limits also had to be imposed on individual behavior). If every person was inherently equal, then a mechanism that allowed each person to express a preference for who would rule had to be developed. Furthermore, because most persons could not devote all of their energy and time to the occupation of ruler, then those few persons who would rule had to be held accountable to the ruled.

Elections became the set of procedures held to be most important to the operation and maintenance of a democracy. If the question is when do people exercise popular sovereignty, the answer, according to Sartori,^[6] “is easy—during elections.” Citizens would select rulers from candidates who sought votes by offering different visions of public policy, and the candidate that attracted the most support (votes) became the ruler, typically in the form of a representative to an assembly of elected officials who had the authority to make public policy.

Once elections became the mechanism through which the people ruled, then the procedural rules for

the conduct of elections became a matter of high interest for citizens, candidates, and officials. Important procedural questions included the following: who may vote, who may be a candidate, how are votes counted, may candidates form groups of like-minded candidates (i.e., political parties), how many representatives will serve in the legislative assembly, how will representatives be selected by voters (e.g., by geographic territory or by occupation), how long a term will each representative serve, and may a representative become a candidate in the next election? Because many different answers to these questions can be devised, different nations have developed different electoral procedures. Consequently, indirect or representative democracy is characterized by a variety of electoral procedures.

These two distinct perspectives on the definition of a democracy—communal vs. individual—bear directly on how one arrives at a policy decision as well as what constitutes legitimate public policy. Direct democracy holds that public policy emanates from decisions made by the whole community, or, to paraphrase Rousseau, sovereignty cannot be represented. Thus, only a collective body composed of all or as many members of the community as practical can truly determine the “... common identity, its life and its will.”^[7] The test of public policy in a direct democracy is whether it “embodies a moral imperative for people to promote common interests.”^[7] Indirect democracy, by contrast, holds that the realities of daily life make it impossible to involve all or most citizens in the continual process of policy making. Put another way, if every adult citizen devoted significant amounts of time to making public policy, there would be no one left to perform all the other tasks necessary to a functioning society. Therefore, some citizens must be selected to form a government and make public policy. Policy decisions are legitimate if they are made by the elected representatives of the people. The key to indirect democracy is the creation of one or more mechanisms by which the people exercise control over the representatives and the policy choices they make. Because each representative is presumed to express the views of the individuals who elected the representative, it is also presumed that a wide range of opinions will exist among the representatives. Consequently, policy will not reflect the “common will” or the “public interest”; instead, public policy will be, as Madison argued, the product of bargaining and negotiation among the individual representatives.

ATTRIBUTES OF DEMOCRACY

Democracy has always been a contested concept, not just in terms of what democracy means in the abstract,

but also what constitutes an actual, functioning democracy. What are the identifiable attributes or features that make possible (or better, probable) “rule by the people?” On what bases or criteria can we decide that one nation (or community) is democratic, while another is not? Democracy as an ideal ultimately has to be translated and transformed into governing institutions that resolve societal problems and produce policy decisions that reflect the consent of the governed.

Citizen influence over policy makers and policy decisions occurs in both democratic and non-democratic regimes. Benevolent dictators populate the pages of history, and even tyrants understand that it is often too costly to ignore popular opinion in every policy decision. If not popular influence, then what? The most typical single answer given by scholars is popular control of policy makers and policy decisions. But even this change of one word (control for influence) does not clearly distinguish democratic government from non-democratic ones. Obviously then, multiple mechanisms are necessary to ensure “rule by the people,” and so scholars of democracy have sought to construct lists of attributes by which they identify a government as democratic.

Although several scholars have offered particular lists, the most widely known and cited list of political institutions that characterize modern democratic government is the one proposed by Robert Dahl. Since his early masterpiece *A Preface To Democratic Theory* in 1956, Dahl has sought to identify the distinguishing marks of democratic government. His current version^[8] includes 1) elected officials, 2) free, fair, and frequent elections, 3) freedom of expression, 4) access to alternative sources of information, 5) associational autonomy, and 6) inclusive citizenship.

Of the six that Dahl identifies, other scholars typically concur with his first four or five features of democratic government: elected representatives, non-coercive elections, basic political freedoms, associational autonomy, and access to independent information. In a very real sense, the marks of a modern democracy were first specified in the U.S. Constitution’s initial 10 amendments, the “Bill of Rights.”

It should be noticed that political equality is not specifically included in Dahl’s list; rather, equality is implicit in the notion that (practically) all citizens have rights to vote, to run for public office, and to exercise a broad range of political freedoms. Also missing from Dahl’s list is the requirement for majority rule. It is omitted because majority rule is simply one of several possible decision rules by which an assembly of citizens or representatives may arrive at a decision. Representative bodies in democratic nations function with different decision rules, including plurality, simple majority, and various forms of extraordinary majorities (more than 50% + 1).

Dahl’s list of fundamental requirements must be present in any political system that is to be considered democratic, but they may be manifested in very different political institutions and policy processes. Comparative studies of democratic politics, to simplify a large body of research, recognize at least three distinct models of democratic political institutions, each of which exhibits a different style of policy making. Variations of each of the three models exist, but the basic institutional differences among the three models are critical to the particular styles of policy making and the way in which popular sovereignty is exercised.

Parliamentary institutions combined with a majoritarian political party system constitute the first model, sometimes referred to as the “Westminster” model, after the Palace of Westminster where the British Parliament meets. The key features (although not all) of Westminster majoritarian democracy are 1) fusion of executive and legislative power, 2) executive power concentrated in a ministerial cabinet, 3) asymmetric bicameralism, 4) exclusively representative government, 5) unitary, centralized government, and 6) two-party system. Majoritarian, parliamentary institutions provide for “rule by the people” through an emphasis on a responsible, strong political party model in that two parties contend for popular support by offering competing policy visions. The winning party gains essentially exclusive control over the instruments of government action and is expected to enact its policy platform. The leader of the majority party in the parliament is also the prime minister who selects the cabinet, thus there is unified control across legislative and executive institutions. Only a vote of no confidence or a loss at the next scheduled election can seriously undermine the party in power’s control over public policy. The United Kingdom is the preeminent example of this model, and many of its former colonies exhibit this form of democratic government.^[9]

Presidential government is a second model of indirect democratic government, and is characterized by a formal separation of powers between executive and legislative institutions. Instead of the fusion of legislative and executive powers that typify parliamentary government, the executive “head of state” in presidentialist governments is selected independently from the legislative branch and cannot be removed by the legislature, except for very serious reasons and through complex procedures. Presidents may propose new policy directions but cannot enact them into law because the legislature is independent of the executive. Instead, the president must build a coalition of legislators (of the president’s party or other parties) that is willing to support the executive’s policy preferences. Presidential systems may be unitary or federal, may have two or more political parties, and may have a bicameral

legislature, especially if the country is large in territory. Presidential governments provide for popular sovereignty through the following three key features: 1) the independent election of the executive from the legislative members of the government, thus reducing the concentration of power in the hands of one office or institution, 2) policy making requires bargaining within and between each legislative chamber as well as between the legislature and the executive, thus ensuring that a multiplicity of views are represented, and 3) because the executive is typically the only public official elected by the whole electorate, the president's policy positions are considered to be those of the electorate (or at least of those who voted for the incumbent).^[10] The United States of America is the preeminent example of presidential government, and it can also be found in several Latin American nations.

A third model of representative democratic government combines the parliamentary form with the presidential to create what is labeled as a "dual power," or "semipresidential" government. The key institutional features include the following: 1) an independently elected head of state [the president], 2) a legislatively selected head of government [the prime minister], 3) an executive cabinet presided over by the prime minister, and 4) a legislature elected independently from the head of state. These nations usually have unitary government, multiple political parties, and may have a unicameral or a bicameral legislature. The reputed benefits for popular sovereignty of a dual-power government: 1) the stability associated with an independent president, 2) the flexibility of a parliamentary majority, and 3) the ability to avoid potential stalemates between the president and the legislature. France is the preeminent example of a "dual-power" democracy, and other examples can be found in Portugal, Finland, the Czech Republic, Poland, Estonia, Lithuania, and Slovenia.^[10]

Each of these three models of democratic government vary by institutional features, style of leadership, nature of policy bargaining, and constitutional rules. The organization of these different types of democratic government affects differentially the ability of citizens to influence policy making. For example, in parliamentary governments, much of the bargaining and debate over policy choices occurs as part of the electoral competition, and once a party wins a parliamentary majority, it can enact its policy platform without any serious obstacles. By contrast, in presidential models, bargaining and debate over policy continue past the election of the president and the legislature, and as a consequence, it is often the case that each policy initiative requires an extensive effort to build a bipartisan majority to support the proposal. The point here is simply that the ideal of "rule by the people" must be transformed from ideas to functioning institutions

and rules by which governing institutions produce policy results that are acceptable and legitimate.

PURPOSES OF DEMOCRACY

Governments of whatever form exhibit some common purposes, among which are social order, dispute resolution, coordination of collective action, and protection from external attack. But many different forms of government have been established with the intent of achieving certain objectives. For example, a Communist government seeks to ensure a dictatorship of the proletariat and to alter the means of production to create a socialist utopia.^[11] Fascism sought to develop and maintain "the glory of the State" so that all other activity in society was subordinate to the State.^[11] But what objectives are to be achieved by establishing a democratic government? Although there is no agreement as to what purposes democracy is designed to attain, there are at least five distinct answers to the question, and each of these answers contains an expectation about the goals of public policy in a democracy.^[2]

The first answer about the purposes of a democratic government is implicit in the core notion of rule of the people. To ensure popular sovereignty, democratic government is designed to constrain the emergence of an elite or a permanent ruling class and to encourage widespread civic participation. The rules of the democratic political game, as expressed in law, create opportunities and resources so that citizens may participate in policy decisions. To put this another way, democratic government is rule by a continually changing cast of amateurs. Furthermore, there are no preordained goals for public action; instead, public policy will be the product of the continually shifting diversity of interests within the community. "All policies will be compromises, and it is unlikely that we shall find any democracy committed to one all-consuming purpose."^[2]

Second and probably the most widely accepted purpose of democracy is the protection of individual rights. Liberal democrats, in their revolutionary attacks on the absolutist State, defined freedom as independence from government control. Jefferson's (and Thomas Paine's) dictum that "the best government is the one that governs least" concisely captures this attitude, but it is important to understand that the context was one where the State controlled most spheres of human activity—commerce and trade, religion and culture, property and status. Locke, who was Jefferson's inspiration, argued that every power government exercised came at the expense of individual liberty and, therefore, the less public policy the

better. Rousseau, on the other hand, argued that individual rights could be increased by government action, e.g., where public policy restricts the rights of employers in order to eliminate unacceptable practices such as gender and racial biases in hiring or child labor.^[12] This debate over negative vs. positive conceptions of freedom does not detract from the basic point that an important purpose of democratic governments is to constrain government as well as individual action to ensure rule by free consent of the governed.

The struggles that produced modern democratic nations were motivated not only by efforts to freely exercise religion and to freely choose one's rulers, but also to protect one's property from confiscation by the State. Much of the justification for limited government rests on the protection of personal property rights, and, by extension, it is often held that an important objective of democratic government is the maintenance of a free or market economy. The fact that one can find market economies in non-democratic nations undermines part of this idea that only under democracy can capitalism flourish. However, because all democracies support capitalist markets, there is obviously a connection between these two distinct societal institutions.^[3,13,14] The link is through public policy, which creates and enforces the rules required to sustain these two institutions. Both democracy and capitalism depend on the freedom of individual choice. Just as democracy depends on a set of procedural rules that provide for competition among candidates, so also does a liberal market depend on rules that provide for competition among producers. Critical to the functioning of market economies is an extensive set of laws and regulations ensuring free choice for producers and consumers, employers and workers. The contemporary efforts to foster economic development in the nations of the former Soviet Union illustrate the necessity of an extensive body of public policy that establishes and maintains the institutions of a modern capitalist economy (e.g., property ownership, enforceable contracts).

A fourth purpose, it is argued, that democracy serves is the development of the individual. The pursuit of equality has been part of the pursuit of liberty because freedom for only some individuals leaves others unfree and unequal. The Christian ideal of the inherent equality and worth of all individuals predates the development of modern democracy, but this idea strongly shaped the earliest arguments for democracy.^[5] Without equality for all persons, the notion of government by consent of the governed is hollow, and so the campaigns to end government by hereditary rulers promised equality as well as liberty. Equality first meant equal franchise—the right to vote—but usually only for males with certain attributes—education, property, and/or race. It is only within

recent history that universal suffrage has become widely accepted.^[15]

Closely associated with equal franchise is the importance of the vote as a means for citizens to communicate their policy preferences to candidates and elected officials. If a whole class of persons is denied the right to vote (e.g., women), then matters of concern to this class of persons is likely to be ignored by public officials. Similarly, if one's vote counts less than someone else's vote (the problem of malapportionment), then one's policy interests will be disadvantaged. Furthermore, if one is not provided with the means to participate in the electoral process (e.g., education, information, finances), then one's ability to participate is diminished. Over time many democratic governments have enacted policies to foster equal participation and one can see the results in the increased diversity of today's elected (and administrative) officials, compared to previous eras.

More recent views on equality have focused on equality of opportunity—the provision of sufficient resources to individuals to permit them to pursue and “fulfill” their dreams. “The notion of democracy has always contained the notion of equality. Not arithmetical equality of income or wealth, but equality of opportunity to realize one's human capacities.”^[16] Predemocratic societies where most persons were serfs or slaves used force or tradition to prevent individuals from realizing their potential. Democratic governments were the first to proclaim the establishment of justice and the promotion of the general welfare as their principal purposes. This has led over time to a policy cornucopia of goods and services that today is labeled as the modern welfare state. From education to employment, from health to social security, the bulk of public policy in a modern democratic state aims to ensure a minimal quality of life for all and to facilitate, in the words of modern psychology, each person's “self-actualization.”^[17]

Perhaps the most unique purpose allegedly served by democracy is that it makes possible a new type of human character. “Democracy, then, both presupposes and tends to promote a particular type of character or personality; or alternatively we may say—since character is a slippery concept—that the system relies on certain attitudes or dispositions or behavior patterns and these it tends to foster because they contribute to the working of the system.”^[2] This argument goes back at least as far the writings of J. S. Mills and de Tocqueville, and has been revisited by such writers as James Bryce and Harold Lasswell. But how is it that a form of government can shape character or personality? An important answer is found in the recent writings that advocate “participatory democracy” as a remedy to the ills of liberal representative democracy. Critics of representative democracy such

as Benjamin Barber see the reliance on elections, interest groups, and political parties as producing a “thin democracy” in which “citizenship is only legal matter; people are bound together by self-interested contracts; and they are politically passive” (as quoted in Ref.^[7]). Departure from “possessive individualist ways of thought and action” (Macpherson’s phrase to describe consumerism and self-centeredness), Carole Pateman claims, “is facilitated by a change in people’s values that results from political participation itself” (as quoted in Ref.^[7]). Democratic citizens are, in a sense, forced to be free; that is, in order to solve problems in the community they must act together collectively—there is no ruler ordering them to act. In a society where all are free to hold and express different views, a democrat not only must tolerate these differences of opinion, but also must strive to find compromises to which a majority can consent. Such complex attitudes and behaviors, it is argued, depend on the development of a public-regarding spirit, and nothing does more to foster this new character than participation in public affairs; that is, action can alter attitudes.

That there are multiple purposes associated with the advocacy of democracy comes as no surprise. Democracy became the wave of the future in the 1600s because the purposes it alleged to serve “fit the minds of men,” in Burke’s phrase. Freedom and liberty, equality and individuality, were exciting ideas that pointed away from tradition and toward a new society. Democracy’s purposes, open and indeterminate, do not constitute the stuff of a dogmatic ideology,^[2] but instead offer a design within which individuals can shape public policy to fit the general interest of their community. Sen^[15] tells us that “a country does not have to be deemed fit *for* democracy; rather it has to become fit *through* democracy” [italics in original]. Democracy, as rule of the people, allows the people to enact public policies designed to pursue purposes that are beneficial to the community. This is what makes democracy, according to Sen,^[15] “a universally relevant system.”

CONCLUSION

The establishment of a democratic form of government is a fundamental public policy decision and makes popular sovereignty the primary principle of the policy-making process. Democracy depends on a set of necessary attributes, but how these critical features are built into governing institutions may vary from place to place. Parliaments and presidents are merely instruments through which popular sovereignty may be achieved; what is critical to democracy is a sufficient level of citizen participation so that the policies

selected reflect the diverse preferences and values within a community or country. Abraham Lincoln proclaimed the core ideas of democracy in his famous aphorism, “government of the people, by the people, and for the people.” The continuing challenge to theorists of democracy as well as to citizens and public officials is the adaptation of the institutional features of government to changing societal conditions without sacrificing the core ideas of popular sovereignty. Just as direct democracy was modified to accommodate population growth, so too must representative democracy be modified to ensure popular sovereignty in a world characterized by deep economic and social inequalities. Although universal suffrage is now widely accepted in most parts of the globe, public policy to provide a minimal quality of life to all citizens has not been attained. Long ago, Jefferson pointed out that certain public policies such as universal education were necessary to a functioning democratic government. The continued impoverishment of a majority of the world’s population stands as a major obstacle to the spread of democracy. But the continued existence of non-democratic forms of government in too many places also blocks action to reduce severe economic and social inequalities. Sen^[15] explains the pragmatic connection between the democratic procedures of government and the substance of public policy:

Political and civil rights give people the opportunity to draw attention forcefully to the general needs and to demand appropriate public action. The response of a government to the acute suffering of its people often depends on the pressure that is put on it. The exercise of political rights (such as voting, criticizing, protesting, and the like) can make a real difference to the political incentives that operate on a government.

Democracy offers citizens a set of instrumental procedures and rules that allow citizens to shape public policy so that “rule of, by, and for the people” is possible. Other forms of government are neither premised on this goal nor are designed to foster it.

Deontology

James R. Heichelbech

Graduate School of Public Affairs, University of Colorado at Denver,
Denver, Colorado, U.S.A.

INTRODUCTION

Deontology refers to any approach to ethics that emphasizes obligation or duty. The most notable deontologists are Immanuel Kant in the eighteenth century and John Rawls in the twentieth century.^[1,2] Deontological theories are typically contrasted with utilitarian theories. Deontology differs from utilitarianism insofar as it specifically excludes consequences as a basis for moral judgment, whereas utilitarianism claims that *only* consequences can serve to ground morality. The practical manifestations of deontology generally focus on principles and obligations, with attention to compliance and enforcement.

ADVANTAGES AND DISADVANTAGES OF DEONTOLOGY

The advantages of deontology are usually found in its intuitive appeal, as many people expect morality to concern principles and obligations. In this respect, the results of deontological thinking are perceived as theoretically well grounded and practically useful. Deontology also seems quite compatible with rights-based ethics, as one is obligated to respect the rights of others. However, this is not to say that deontology and rights always produce the same results. For example, there are obligations that might not have corresponding rights, such as keeping a generous promise.

Deontological approaches to ethics have been criticized in numerous ways. They offer a “thin” conception of morality, some argue, as they focus on rationality to the exclusion of other human qualities, such as emotion. Responses to these criticisms range from defenses of traditional theories to development of hybrid theories.

KANT

Historically, the most prominent deontologist has been Immanuel Kant, whose work remains central, if difficult reading for anyone interested in principle-oriented ethics. Although the *Groundwork of the Metaphysics of Morals* is only a small part of Kant’s work on moral theory, and not the central work at that, it is what most

academics intend when they refer to Kant’s ethics. A brief overview of the *Groundwork*, therefore, will suffice as a description of Kant’s deontological theory as it is typically characterized.

The primary goal of the *Groundwork* is to discover the supreme principle of morality. According to Kant, a principle of morality must carry with it absolute necessity, for nothing else, he argues, is adequate to the task of grounding obligation. Numerous concepts are particularly important for understanding his attempt to meet this challenge—a *good will*, *duty*, *autonomy*, and the *categorical imperative*.

Kant begins the *Groundwork* by explaining that nothing is good without qualification, except a *good will*. A good will is good through its willing alone, not through the resulting consequences. Furthermore, a good will is unqualified in this way insofar as it is determined solely by the motive of *duty*, for it is only through the motive of duty that a will is capable of obligating itself. Acting from duty requires acting from principle alone.

Autonomy is a property that a will has in virtue of its capacity for acting from duty, for being a law unto itself. An autonomous will is free in the sense that it determines the principle of its own volition apart from all natural interests or causes. Because only an autonomous will can determine itself, only such a will is capable of acting from duty. Because it is self-legislation that creates obligation, only a will that is self-legislating can fulfill an obligation. Only an autonomous will, therefore, can be good.

The *categorical imperative* is the practical expression of the principle of morality. It is a command of reason concerned only with its own form and the principle from which it follows, not with the action itself or the results. There are two specific formulations that are more frequently mentioned. First, *act only on that maxim through which you can at the same time will that it should become a universal law*. Second, *act in such a way that you always treat humanity, whether in your own person or in the person of any other, never simply as a means, but always at the same time as an end*. One who is moral must necessarily will in accordance with the categorical imperative. However, even a conscious effort to act according to the categorical imperative does not guarantee moral success. One can never know whether one in fact has a good will.

RAWLS

In *A Theory of Justice*, John Rawls described what he calls “justice as fairness,” which consists of principles chosen from an “original position” of rational deliberation. He argued that principles of social justice concern the basic structure of society through the arrangement of major social institutions. Justice as fairness requires principles that “free and rational persons concerned to further their own interests would accept in an initial position of equality as defining the fundamental terms of their association.”^[2]

From this initial position, or original position, principles of justice are chosen from behind a “veil of ignorance,” without knowledge of anyone’s place in society or natural abilities. Rawls argued that two principles in particular would be chosen: 1) “each person is to have an equal right to the most extensive basic liberty compatible with a similar liberty for others” and 2) “social economic inequalities are to be arranged so that they are both (a) reasonably expected to be to everyone’s advantage, and (b) attached to positions and offices open to all.”^[2]

Justice as fairness is deontological for a few reasons. First, Rawls’ account of justice fits within the social contract tradition, placing emphasis on the importance of *agreement* as a necessary condition of principles that can obligate, just as Kant claimed that moral principles must be self-legislated. A second reason is that Rawls himself labeled it as such. Because justice as fairness is not a teleological theory, such as utilitarianism, it is by definition deontological. Specifically, justice as fairness “does not interpret the right as maximizing the good.”^[2] “The original position,” Rawls said, can be viewed as “a procedural interpretation of Kant’s concept of autonomy and the categorical imperative.”^[2] Whereas utilitarianism values the satisfaction of all desires, justice as fairness accepts principles without knowledge of more particular interests.

DEONTOLOGY IN PRACTICE

Practical manifestations of deontology reflect the emphasis on obligations and principles. Although the principles are usually not explicitly self-legislated, they are typically considered principles that every rational agent would choose or should choose. It is this aspect that lends the weight of moral obligation. Deontologically grounded principles are typically directed toward basic concerns about the dignity and equality of persons. They frequently have the aim of preserving rational decision-making processes as well. Codes of conduct, regulations concerning financial conflicts of interest, and other sorts of “principle-oriented” efforts strive to clarify what is acceptable and what is not.

Deontology is a useful concept for administrators insofar as it helps to clarify the nature of administrative ethics. Traditionally, ethics in U.S. government has revolved around constitutionally based prohibitions. The deontological character of public administration consists of obligations that correspond to various rights, such as those mentioned in the U.S. Declaration of Independence—life, liberty, and the pursuit of happiness. Such “inalienable” rights obligate us in the strongest sense. However, the specific duties described in the U.S. Constitution tend to be negative. That is, government is prohibited from infringing on specific rights, such as free exercise of religion. Duties of public administration, therefore, tend to be indirect and prohibitive.

Two specific examples of this form of administrative deontology are programs directed by the U.S. Office of Government Ethics and the handling of compliance issues within human resources management. The Office of Government Ethics works to educate government employees about various obligations, most of which concern impartiality and the proper use of position. Through specific rules that prohibit or restrict such things as gifts and honoraria, these obligations help to preserve the integrity of public sector agencies, which are in turn an important piece of democratic decision making.

As important as expressions of democratic decision making are the various laws governing employment practices. The compliance issues encountered by human resource specialists are deontological, both in the sense that they concern obligations and in the sense that they concern the basic structure of the work environment, one that free and rational persons would choose.

Despite the solid grounding in negative duties, there is a growing trend within public administration toward positive duties. Whereas traditional duties have been correlates of rights, public administrators are more frequently thinking as professionals, for whom duties emerge from a sense of integrity and responsibility. Evidence of this trend is clearly visible in the American Society of Public Administration Code of Ethics, with its emphasis on personal integrity and professional excellence. There is a greater sense now than in the past that obligations must be self-imposed and principles are developed beyond external authority. In this sense, public administration is becoming more genuinely deontological.

Development Administration in Southeast Asia

Mark Turner

*School of Management and Policy, University of Canberra, Canberra,
Australian Capital Territory, Australia*

INTRODUCTION

Development administration was welcomed into newly independent countries of Southeast Asia after the Second World War as a vehicle for facilitating economic and social development. The rate and nature of its adoption varied between countries and have been mediated by factors such as resource endowment, development policies, political regimes, and history. Thus the contemporary profile of development administration in Southeast Asia varies significantly between countries in the region. The appreciation of the importance of development administration for improving human welfare and economic progress has never been stronger, with all the regions' countries currently engaged in a variety of reforms and innovations selected from a lengthening list of possible development administration initiatives.

FROM DEVELOPMENT ADMINISTRATION TO DEVELOPMENT MANAGEMENT

Development administration was a form of social engineering imported from the West in the 1950s and 1960s, which was built on a belief in the application of rational scientific principles and Keynesian welfare economics. Governments in the West and Southeast Asia perceived it as a managerial weapon in the war against communism, which would stem revolutionary appeal by delivering the benefits of modern capitalist development. Its success in this venture was circumscribed by the triumph of revolutionary forces in Vietnam, Laos, and Cambodia.

Development administration demonstrated faith in a "big government" and the leading role the state should play in development. It was also synonymous with public administration, although it was distinguished from practices in rich countries by "that inconvenient combination: extensive needs, low capacities, and severe obstacles."^[1] A tool bag of development administration interventions was created and transferred to Southeast Asia via foreign aid programs. In the 1970s, questions over the efficacy of this approach resulted in "a period of self-criticism, reflection, and uncertainty."^[2] Development administration had reached a "deadlock,"^[3] or was seen to be in "crisis."^[4]

A rethinking of development administration was urgently needed. This coincided with the rise of neo-classical economics in determining the development agenda. Big government was out, and private sector ownership and management techniques were in. Thus new public management (NPM) was soon being exported to the public sectors of developing countries in Southeast Asia, although its reception was less than welcoming in many instances. Participation also moved to the mainstream of thinking either by non-governmental organizations (NGOs), or by a renewed interest in territorial decentralization. The agenda of development administration broadened considerably beyond its early public administration focus to embrace diverse activities from privatization to community participation.

Today, we can define development administration, or development management as it is often known, as:

- An academic subfield in the social sciences
- Built around a set of problems relating to the management of development, rather than being a distinct body of theory
- Heavily but not exclusively focused on public administration
- Embracing a wide range of approaches to managing development, including actions by non-state actors
- Being concerned with power and politics as determinants of development policy making and its implementation
- Applying to almost 75% of the world's population, residing in countries displaying diverse characteristics.

CONTEMPORARY SOUTHEAST ASIA

Development administration operates in a variety of contexts in Southeast Asia (Table 1). At one extreme, there is Singapore with a GNI per capita above that of its former colonial ruler, the UK; whereas at the other extreme, there are impoverished nations such as Cambodia and Laos. Populations are as large as 212 million in Indonesia, but are as low as 350,000 in Brunei. There are countries that have functioning democracies, semidemocracies, and one-party or authoritarian states. Culture is variegated both between

Table 1 Selected environmental features of Southeast Asian countries

Country	Population of 2002 (millions)	GNI per capita PPP of 2002 (US\$)	GDP growth rate per capita (%) of 1999–2002	Adult literacy (%) age 15 years and above of 2002	Life expectancy of 2002 (years)	Political regime of 2002	Leading religion of 2002
Brunei	0.35	19,210		91.6	76.6	Sultanate	Islam
Cambodia	12	1,590	3.7	69.4	54.0	Multiparty democracy	Buddhism
Indonesia	212	2,990	1.7	87.3	66.2	Multiparty democracy	Islam
Lao PDR	6	1,610	3.5	66.4	54.5	One-party state	Buddhism
Malaysia	24	8,280	2.2	88.4	72.8	Semidemocracy	Islam
Myanmar	49	1,027	9.9	85.3	57.2	Military authoritarian	Buddhism
Philippines	80	4,280	1.8	95.4	69.8	Multiparty democracy	Roman Catholic, Islam
Singapore	4	23,090	3.4	92.8	78.4	Semidemocracy	Various
Thailand	62	6,680	3.3	95.8	69.2	Multiparty democracy	Buddhism
Vietnam	81	2,240	4.4	92.9	69.7	One-party state	Buddhism

Source: Ref.^[5].

countries and even within them. Thailand is predominantly Buddhist, the Philippines is Roman Catholic, and Indonesia is Moslem. However, there are small but significant Islamic minorities in Thailand and the Philippines, whereas Indonesia has substantial Christian and Hindu minorities. What this means is that the environment for development administration in Southeast Asia differs between countries—often quite dramatically. Thus the practices and innovations that are employed under this broad umbrella are many and vary according to circumstances.

PUBLIC ADMINISTRATION AND ITS REFORM IN SOUTHEAST ASIA

In Southeast Asia, the concept of bureaucracy as set out in Weber's ideal type has retained a strong appeal among civil service elites, who have most often been able to direct the design and implementation of public administration reform. They are attracted to what the model appears to offer—efficient administration, reliance on formal rules, hierarchy, and upward accountability—rather than by dysfunctions that have frequently characterized public administration in the region. For example, the Philippine public administration has been criticized for being under the influence of “partisan politics, geographical ties, the compadre system, familial obligation, and personal factors.”^[6] In Indonesia, dysfunctional civil service practices have included the sale of positions, extortion of money for promotions, seeking bribes for favorable decisions, and marking up project costs to secure illegal payments. Among the problems in Thailand's public service have been “patronage and corruption in appointments and promotions, lack of performance incentives, and overcentralization.”^[7] In Vietnam, there has been concern with the failure to integrate public administration reform with political strategies, the poor quality of legal documents, the overlapping and unclear definition of organizational functions, and low skill levels and budgeting geared to the number of staff rather than functional priorities or results.^[8]

The dysfunctions of public administration have not been ignored in Southeast Asia. There is a long history of reform, although there have been considerable contrasts between countries. For example, Singapore and Malaysia have almost 50 years of experience with successful incremental reforms, whereas in the Philippines, despite most presidents having a comprehensive public administration reform program, not one has ever been implemented.^[9] The governments of Vietnam and Lao PDR have, until recently, been reticent to engage in substantial public administration reforms, perhaps fearing a diminution of political control.

However, today, all countries in Southeast Asia are engaged in public administration reform, often with great enthusiasm. The reasons for the growing importance of public administration are as follows:

- A perceived link between public administration and international competitiveness
- The potential contribution good public administration can make to sustainable human development
- Democratization requiring reconsideration of the relationship between state and society
- The promotion and support of good governance, including public administration reform, by multilateral and bilateral development agencies.

The dominant theme in public administration reform across Southeast Asia has been bureaucratic modernization. Although the preferred method of reform has been incremental adjustments, there is currently some interest in systemic reforms. For example, in Vietnam, a Public Administration Master Plan has been introduced for the period 2001–2010. It builds on prior incremental changes and includes the following:

1. Program to renovate the development, issuance, and quality improvement of legal normative documents
2. Program on roles, functions, and organizational structures of the agencies in the administrative system
3. Program on staff downsizing
4. Program on improving the quality of cadres and civil servants
5. Program on salary reform
6. Program on renovation of financial management mechanisms for administrative and public service delivery agencies
7. Program to modernize the administrative system.

These are not new ideas. The novel aspect is putting them together in an integrated program on a major scale, guided by a vision of what the government hopes to achieve. Thailand has also commenced an ambitious program of systemwide public administration reforms. The civil service has, in the past, been able to resist any radical reforms due to its powerful position in the Thai state. However, the gradual erosion of that power and the impact of the Asian financial crisis in 1997 provided the policy opportunity and impetus for the introduction of far-reaching changes to the public service. These include a move toward “strategic performance-based budgeting”; the introduction of accrual accounting; a more efficient and transparent procurement process; improved procedures in revenue collection, especially through new information and communications technology; reorganization of the

structures and functions of ministries; the introduction of results-based management; and the establishment of a Public Sector Development Commission (PSDC) to monitor public sector reform and advise the cabinet on policy.^[10]

Although there has been considerable interest across Southeast Asia in public administration reforms in other countries, there has been only a limited adoption of NPM. If we view NPM as a menu of items, then we can classify the countries of Southeast Asia into three distinct groups according to the number of items selected for implementation.^[11] Singapore and Malaysia are “enthusiastic diners” having introduced a wide range of NPM-style reforms. However, some initiatives are not new for these countries, whereas other items from the NPM menu have not been introduced. Borrowing reform initiatives and modifying them to suit local conditions have long histories in Malaysia and Singapore. The Philippines, Thailand, and Indonesia can be described as “cautious diners” because they are familiar with the menu but so far have experimented with a few reforms from the NPM menu. However, Thailand’s new reform program may lift it into the “enthusiastic diners” category. Finally, there are those countries that are “unfamiliar with the menu,” such as Lao PDR, Cambodia, and Vietnam. The governments appreciate the need for public sector reform and are, to some degree, engaged in it. However, they lack institutions and other environmental conditions necessary for NPM reforms.

There are several important variables that explain the differential adoption of NPM and the widespread persistence of bureaucratic modernization as the overriding reform theme across Southeast Asia. First, the most NPM-friendly countries are also the wealthiest, and, in the cases of Singapore and Malaysia, have many institutions derived from Britain—the heartland of NPM. In poor countries such as Lao PDR or Cambodia, NPM-style reforms may be unaffordable, impractical, and irrelevant. Second, state–society relations in Southeast Asia involve greater responsibility for national development being claimed by the state than in Organization for Economic Cooperation and Development (OECD) countries. Third, there are Southeast Asian values that may clash with NPM notions of public administration reform. These values could include group reference rather than individual reference; conflict avoidance; importance of “face”; respect for authority and seniority; paternalism; respect for academic credentials; undervaluation of the professional role of women; belief in cosmology and superstition; and the importance of family support.^[12,13] Although these values may also be found in Western countries, their relative importance and particular combination in Southeast Asia produce different behavioral outcomes. Fourth, the political

regimes of Southeast Asia show considerable diversity—ranging from authoritarianism in Burma, through one-party regimes in Vietnam and Lao PDR, to semi-democracies in Malaysia and Singapore, to “elite democracy” in the Philippines. Some of these regimes are not receptive to particular NPM initiatives, especially those that could be seen to diminish regime power and legitimacy. Finally, some items on the NPM menu fit well with the longstanding Southeast Asian theme of bureaucratic modernization focusing on efficiency gains.

DECENTRALIZATION

One of the most significant trends in development administration in Southeast Asia has been decentralization. Power and authority have been taken from centralized bureaucracies and have devolved to elected local councils or deconcentrated offices of central agencies. The driving forces behind decentralization have been democratization and the belief that service delivery will be improved. The Philippines was the first country to decentralize through the Local Government Code of 1991. This legislation gave local government units responsibility for basic services in health, agriculture, public works, social welfare, and environment and natural resources. Funds to pay for these new functions were also given to the elected councils at provincial, city, municipal, and *barangay* (community) levels. Participation by NGOs and the private sector in local governance was also decreed in the Local Government Code of 1991. The general opinion is that the decentralization in the Philippines has been “fairly successful” in bringing devolved democratic governance to people across the Philippines.^[14,15] Whether it has led to improved service delivery is more difficult to determine.

Indonesia was the next country to engage in decentralization. Under the authoritarian New Order regime of President Suharto, Indonesia had been a highly centralized state. Hasty legislation (Laws 22 and 25 of 1999) after Suharto’s removal from office resulted in Southeast Asia’s most radical decentralization program. The regional hierarchy was abolished, leading to a considerable reduction in the authority and importance of the province, and a great increase in the authority of the districts. A long list of functions was placed under the control of the autonomous districts. The list includes public works, health, education and culture, agriculture, communication, industry and trade, capital investment, environment, land, cooperatives, “manpower affairs,” and the management of national resources. Locally elected assemblies have become very important as they now set regional policy and manage vastly increased resources. Implementation

has been problematic. The schedule was too short; the legislation had some fundamental weaknesses and is to be revised; the regulatory program necessitated by Laws 22 and 25 has not been completed; there are regional inequities; accountability provisions are suspect; and “money politics” has arrived in the regions.^[16]

Further experiments in decentralization have taken place in Thailand where the current government is enhancing the powers of the provincial governors—now referred to as chief executive officers (CEOs)—at the expense of central ministries, and is also trying to enhance the role of the grassroots Tambon Councils. In Cambodia, steps have been taken to both devolve and deconcentrate.^[17] Devolution is to the elected Commune Councils while deconcentration is to the field offices of ministries such as health, education, and agriculture. Progress has been slow, with very limited resources and functions devolved to the Commune Councils, whereas deconcentration moves at a pace and in a manner determined by cautious central ministries.

CONCLUSION

All governments in Southeast Asia appreciate the importance of development administration for national development, and all are engaged in reform initiatives to improve the performance of their public service and local government institutions. The longstanding theme of bureaucratic modernization is still evident in public administration reforms to increase the efficiency of the government by initiatives such as reducing red tape, introducing ICT, and downsizing and strengthening budgetary procedures. This has been accompanied by decentralization experiments in the Philippines, Indonesia, Cambodia, and Thailand. The pace and content of reforms have varied between countries according to a range of environmental features. Interest in reform and continued activity in the field will undoubtedly persist as Southeast Asian countries seek to improve their international competitiveness, extend participation and democracy, and seek to improve the amount and quality of services delivered to their citizens.

Development Policy

Lawrence S. Graham

Department of Government, University of Texas, Austin, Texas, U.S.A.

INTRODUCTION

Development policy is the general term used to capture the dynamics and the processes of purposive change focused on creating the conditions for economic growth, technological change, and human development. There is growing consensus that although economic growth centered in markets and measured in terms of increases in gross domestic product (GDP) is indispensable, it is not a sufficient condition to bring about improvements in the human condition in such a way that human development can occur. Although the human development concept embraces numerous different indices, it is generally defined as the process of enlarging people's choices in terms of securing human rights, guaranteeing their basic necessities, and enabling them to improve the quality of their own lives. Linked to this shift toward thinking of development in more humane terms are initiatives involving empowerment, participation, equity, and sustainability. In this debate over how to both engender economic growth and increase the capacity of people in all nations and communities to improve their conditions of life, the tasks remain daunting.

Although problems of poverty, ethnic and cultural conflict, and inequities in income distribution and in opportunities to improve conditions of life continue to present obstacles, advances have been made in setting priorities for the development programs and projects that comprise development policy. In the midst of thousands of reports and publications related to development, the annual publication of the World Bank's World Development Report (WDP) and the United Nations Development Programme's Human Development Report (HDP) are primary sources of information and valuable documents to consult in understanding the changing agendas that dominate the discourse on development. As a consequence, in exploring development issues, reference to the Human Development Index and awareness of the range of indicators used for this index are as important as discussions of GDP, tables surveying economic growth, and understanding the economic and social indicators used to measure development on a worldwide basis. Especially useful documents are the WDP and HDP reports for 2000, issued at the turn of the century, which reflect the changing concepts and increased understanding of issues involved in development policy.

LINKING PUBLIC ADMINISTRATION AND POLICY WITH DEVELOPMENT

There is a relevant public administration and policy literature that reflects changing perceptions of the issues linked to development over the last half century. Although there was an earlier literature on civil service systems in Western Europe published in the 1930s, generally comparative concerns in public administration and policy date back to the 1960s, to the formation of the Comparative Administration Group (CAG), under the leadership of Fred W. Riggs, with funding from the Ford Foundation. Despite criticism of the CAG's publications and Riggs' work on the ecology of public administration in developing countries on the grounds that they were excessively theoretical, they generated a new body of scholarship, centered largely in South and East Asian experience, which called attention to the very different ethos surrounding public administration in the developing countries. Names that stand out in this literature are William J. Siffin, John Montgomery, Ralph Braibanti, Ferrel Heady, and Milton J. Esman. Many of these scholars responded to the critique of excessive theorizing in the CAG by emphasizing that the endeavor they were embarked on was development administration, explaining the conditions in the national bureaucracies of the developing countries that worked against development initiatives. What was needed, they emphasized, was a more relevant public administration, capable of responding to the issues they had confronted in programs and projects linked to economic development, social change, and improvement in such diverse areas as agriculture, public health, and education. Sources summing up this debate and the evolution of this field into what has become known as comparative and development administration are works authored or edited by Heady, Esman, and Farazmand.

Although the public administration literature that is international in its perspective and identified with a professional school orientation has continued to focus on the Third World across the years, an important parallel is to be found in the comparative policy work of political scientists such as Peters; Heidenheimer, Heelo, and Adams; Aberbach, Putnam, and Rockman; and Freeman. Essentially European in its concerns, as this literature has evolved, it has focused more generally on the industrialized countries and the transformation of

these societies through changing technologies, immigration policy, and social welfare.

Both perspectives on public administration and policy in the developed and the developing countries, however, have undergone considerable evolution, as the issues of development and change in the modern world have become more complex. In the public administration field, in addition to evolving perspectives on comparative and development administration, the impact of business administration can be traced in the literature on public management and the emergence of a distinctive development management literature (with its own particular concerns with public management in developing countries and the techniques and skills public managers need for their work in government and civil society, in postindustrial and industrializing societies). More recent concerns, in the shift toward policy and process in development work, are to be found in the policy reform literature. The best way to capture these developments is to consult the work of Brinkerhoff and Crosby.

Yet another path taken in the public administration and policy field, which falls within the purview of development policy, is that centered on institutional analysis and development. Derived from the rational choice institutionalist literature, the evolution of this line of thinking about how to better confront development dilemmas is best reflected in Ostrom's work. The themes dominating this writing concern the need for precise, operational concepts and applications in policy analysis that focus on thinking of institutions as rules that over time structure politics, policy, and action, and have a direct impact on political and administrative behavior in various national settings, be they Asian or Western European. Ostrom's work in development policy is explicit in how it lays out the various incentives and disincentives that influence policy in such areas as common property resource management. Issues concerning communal grazing, irrigation systems, fisheries, and forestry services, and how to retain a common set of rules and expectations center on the use of these resources in such a way that they can be sustained over time without destroying them. Another area of activity involves policy issues concerning questions of infrastructure development and maintenance—for example, the use of simple and complex market arrangements, centralized management and control initiatives, decentralized policy incentives, and polycentric management schemes. These latter, more complex schemes aim at providing more dynamic mixes of centralization (to provide more effective coordination and control of development initiatives) and decentralized programmatic initiatives (to encourage wider citizen participation and greater involvement of the users of public services) in maintaining roads, sufficient water supply, and sanitation and waste systems.

CONCLUSION

The most important point to be made about development issues in public administration and policy is the convergence that has been occurring in the contemporary world in its concern with issues related to economic growth, the maximization of social capital, and sustainable conditions of life. Although there are obviously enormous differences between the most technologically advanced countries and the least developed societies and economies, we can no longer comfortably focus on the shift to knowledge-based industries in the new economies of the more advanced countries, to the exclusion of the enormous problems in public health, poverty, and deficiencies in education that confront those societies, which remain apart from the market economies and levels of living that have accompanied the affluence generated in the First World, as opposed to the poverty and hardships characteristic of the Third World. The confluence of both developments is foremost among the challenges to be faced in responding to the enormous changes occurring in science and technology, in the economy, and in society, and in confronting the conflicts and tensions present when these two worlds intersect. No document sums up more effectively this convergence in development policy (with its emphasis on the need to reconcile security concerns with those of development in a world that no longer can separate issues of development from those of underdevelopment) than the European Commission's May 2001 report, *The European Union's Role in Promoting Human Rights and Democratisation in Third World Countries*. This report adopts the language of development policy and focuses on human development as the basis for promoting human rights globally, and creating more open societies and economies.

Discipline and Dismissal

Steven W. Hays

*Department of Government and International Studies, University of South Carolina,
Columbia, South Carolina, U.S.A.*

INTRODUCTION

Discipline and dismissal comprise the human resource management processes by which organizations seek to correct deviations from acceptable conduct, and to rid themselves of individuals who are unable or unwilling to comply with reasonable standards of performance. Discipline is an ongoing responsibility of every manager, all of whom are expected to identify problems arising from employee behavior and introduce corrective measures. The application of discipline is not necessarily a negative process, in that the ultimate objective of a disciplinary procedure should be to provide employees with proactive guidance on how to improve their deficiencies. Dismissal, in contrast, should occur only when a worker has committed an offense that is so serious that it demands immediate action, or has proven to be unable to perform at an acceptable level after being provided with ample opportunity to address performance shortcomings.

THE GOVERNMENTAL CONTEXT OF DISCIPLINE AND DISMISSAL

Unlike conditions that prevail in much of the private sector, public managers confront numerous additional constraints when imposing discipline or undertaking dismissal actions against workers. Non-unionized private employees have few recognized rights in their employment. They serve “at will,” meaning that they can be hired or fired with or without a substantive cause. In contrast, civil servants enjoy a considerable number of protections from any “adverse action” that is pursued by a supervisor. Because of the fear that political factors might contribute to their mistreatment or termination, public employees typically cannot be sanctioned without careful attention to numerous procedural, legal, and constitutional guidelines. In legalistic terms, this means that public workers retain certain property and liberty interests in their employment that require extreme caution on the part of supervisors seeking their punishment or termination.

In brief, civil servants are entitled to due process whenever faced with a disciplinary action that substantially threatens their job status, such as a demotion,

suspension, or termination. Due process potentially includes many factors, but the most basic requirements are as follows:^[1]

1. Managers must abide by the human resource management procedures that are in place; any requirements included in a policy manual, employee handbook, or other document might be interpreted in court as an “implied contract.”
2. Any adverse action must be based on a job-related reason or cause; employees cannot be sanctioned for actions or behaviors that do not influence their job performance in some negative fashion.
3. Employees are protected by all relevant anti-discrimination legislation; disciplinary or termination actions are forbidden if they are motivated by discriminatory intent involving a person’s race, religion, ethnicity, age, sex, disability, or other protected categories.
4. Supervisors cannot ignore constitutional protections during disciplinary proceedings; employees retain all constitutional rights to free speech, assembly, and other liberties, unless the exercise of those rights severely impinges on the agency’s ability to deliver public services effectively.
5. Any adverse action that is conducted in an “outrageous” manner or that is contrary to “public policy” is illegal. Outrageous actions include those that are conducted in a harmful, crass, and embarrassing manner (e.g., a highly public tongue-lashing), whereas violations of public policy occur when punishment is based on malice, bad faith, or is contrary to statutory requirements. For instance, employees cannot be fired in retaliation for filing sexual harassment charges or worker’s compensation claims, nor can they be punished for complying with a legal obligation (e.g., testifying under subpoena against the employer).

Despite these restrictions on discipline and dismissal, the widespread perception that civil servants “can’t be fired without an act of God” is seriously

exaggerated. In most jurisdictions, the necessary procedures are in place for effective employee discipline, provided that supervisors play by the rules. Another important development in recent years has been the impact that the reinvention movement has exerted on employee protections. The “merit systems” of many states have been abolished or weakened, a phenomenon that generally reduces employees’ ability to challenge the personnel decisions of their superiors. Many of the traditional systems of employee protection—such as multiple avenues of appeal and unreasonable restrictions on managerial discretion—have been dismantled. For these reasons, there is a clear and distinct trend toward exposing civil servants to greater risks of being disciplined and/or terminated for misconduct or poor performance.^[2]

PROGRESSIVE DISCIPLINE PROCEDURES

Whatever their legal status in challenging supervisory actions, public servants are like any other group of workers. Most are well intentioned and industrious, yet there are always some (hopefully only a few) who are “problem employees.” The presence of such individuals in the organization has multiple repercussions. It has been estimated that a poorly performing worker will consume at least 10 times more of the manager’s time than any (or all) of the competent employees. Clearly, the best way to address this crisis is to avoid it in the first place. That is, a properly functioning human resource management system should weed out most of the misfits before they are hired. Likewise, mentoring systems, careful background checks, and the effective use of probationary periods are helpful ways of solving potential problems before they become acute. Only after an employee has successfully completed a probationary period—usually 1 calendar year—does that individual acquire legal rights to challenge adverse personnel actions. But once that threshold has been successfully crossed, public managers need to exercise care and tact in the handling of employees whose performance is subpar.

A Non-Punitive Focus

The use of a progressive discipline procedure is generally considered to be an effective means of responding to problem employees in contemporary public agencies. These procedures are based on the premise that discipline ought to have a positive rather than a punitive focus. The underlying ethos is to provide the offending worker with notice that a problem exists. Once the performance dilemma has been identified, the requisite steps to resolve the situation should then

be articulated. Thus, supervisors have the obligation to confront workers with their complaints and to delineate the specific reasons why they are displeased. Especially in this era of worker empowerment, managers also are expected to involve the subordinate in the problem-solving process. This might be accomplished by discussing the problem with the worker, allowing them to suggest appropriate responses. A poorly performing individual may need additional training or simply the reality check that comes with a confrontation from the boss. In other cases, a detailed work improvement plan may need to be established. The basic point is that no worker can be expected to remedy a deficiency until she has been notified that the problem exists and then provided with feedback on what constitutes acceptable behavior.

Non-punitive approaches to employee discipline are believed to create fewer tensions between managers and workers, and therefore have a greater likelihood of use and success. Research has also demonstrated that managers need to be trained in the technical and behavioral aspects of disciplinary actions.^[3] In addition to increasing the manager’s self-confidence, training improves their appreciation for the legal and emotional pitfalls that surround employee discipline. Another noteworthy characteristic of the non-punitive approach is that, if it is followed carefully, it will withstand most legal challenges by disgruntled employees. Perhaps the most oft-cited explanation for worker grievances against their supervisors is that they were “surprised” by the discipline that was invoked. A regularized system of meeting and discussing performance problems reduces the frequency of such complaints.

Consistency Through Procedural Guidance

Another possible pitfall in the application of discipline is the potential for treating employees arbitrarily or differentially. That is, one worker might be punished for a minor infraction, whereas other employees committing the same offense are ignored. If this phenomenon occurs (which it often does), the sanctioned employee can successfully challenge the disciplinary action on the grounds that they have been singled out for punishment. The essential issue is that employees must be treated in a consistent fashion or else the entire disciplinary scheme is threatened. Although certainly not a panacea, the prescribed response to this dilemma is to provide employees and supervisors with a comprehensive list of infractions and the sanctions that will be imposed for each incident. These progressive discipline procedures are usually inserted in employee handbooks, and consist of lengthy lists of violations accompanied by the punishment that will be invoked for the first, second, and third offenses.

For instance, tardiness might be countered with a verbal warning in the first instance, a written warning on the second occurrence, and a formal reprimand on the third occurrence. More serious offenses, such as stealing or sleeping on the job, might call for immediate termination for the first or second offense.

Benefits of a Written Procedure

The existence of a written procedure fulfills three important purposes. First, it constitutes a form of prior notice to employees concerning the norms of acceptable and unacceptable conduct. This makes it more difficult for a worker to allege that they “didn’t know” that a particular behavior (e.g., making personal telephone calls on agency time) was forbidden. Second, the procedure contributes to the organization’s effort to ensure that workers are treated consistently under the same set of circumstances. A clear delineation of appropriate sanctions essentially constitutes a disciplinary template that ought to be applied uniformly. (No one would be naïve enough to assume that such procedures always result in consistent treatment, but at least their presence provides supervisors with guidance in pursuit of that elusive goal.) Finally, the creation and dissemination of a list of prescribed conduct strengthens the agency’s hand in complying with a number of legal expectations concerning the handling of its workforce. One notable example is sexual harassment. Prior to the last decade or so, concise agency standards concerning the punishment for various types of sexual misconduct were rare. Now, with the inclusion of expansive sexual harassment provisions in the agencies’ progressive discipline codes, the organizations are able to demonstrate a proactive posture toward eliminating such conduct. This does not exonerate them from liability if they fail to act, but it does demonstrate to judges and juries that they have taken steps to avoid problems and to punish transgressors.

DISMISSAL: THE ULTIMATE SANCTION

When positive efforts to correct employee misconduct fail, the agency is confronted with a narrow range of unpleasant choices. The honorable, but often most difficult, response is to initiate formal termination proceedings. This requires that the supervisor be able to document the performance or behavioral deficiencies, and be prepared to spend considerable time justifying and defending their actions in the event that the employee files a grievance. This occurs with the prior knowledge that the supervisor’s conduct will be exposed to as much scrutiny as that of the offending worker. Supervisors must be able to demonstrate adequate

reasons (job related) for their actions, and to show that they followed all applicable procedures and treated the employee fairly. Dismissal also requires, of course, the necessity for a face-to-face session in which the decision is explained to the employee. Because this is a messy and time-consuming process, terminations in government are far less common than in the private sector. On average, private employers terminate about 8% of their workforces annually, whereas dismissal rates in government hover below 1%.^[4]

There is little mystery about what happens to public employees who deserve to be terminated but who avoid formal dismissal actions. Too often, the agency’s response is either to ignore the inappropriate conduct, or to deal with it in a more proactive yet underhanded fashion. Common responses include promoting the bad employee “up and out of the way,” providing a glowing letter of recommendation so as to pawn the worker off on another agency, or to transfer them to a position that carries no responsibility (so-called “turkey farm” jobs). These are age-old “solutions” to the problem employee puzzle, but clearly represent inadequate (even dishonest) responses that are unfair to everyone involved.

Fortunately, the number of successful terminations in public agencies is likely to increase over time in response to the reduction in employee protections that is occurring as part of government reinvention. A related phenomenon is the increased use of alternative dispute resolution techniques, such as mandatory mediation and perhaps even binding arbitration. By reducing the number of appeals and expediting the review process, reformers hope to increase government’s ability to rid itself of inept and corrupt employees. As such, there is a discernable move away from highly formalized litigation that is time consuming, expensive, and intimidating to all concerned. The only downside of this trend is the possibility that some innocent and conscientious civil servants might be sacrificed as procedural protections are reduced. In the eyes of most reformers, however, this is a risk that they are willing to take.

Diversity

Sonia M. Ospina

James F. O'Sullivan

*Robert F. Wagner Graduate School of Public Service, New York University,
New York, New York, U.S.A.*

INTRODUCTION

Public agencies have the mandate to consider the plurality of values, concerns, and voices of the larger population in their work, as well as to include a wide variety of citizens in their workforce. When diversity is pursued as an organizational objective, more efficient management and the democratic values of responsiveness and representation in public administration are both said to be better achieved.

Workforce diversity emphasizes functioning with employees with differences in personality, work style, and the visible manifestations of social diversity, such as gender and ethnicity, and using those differences to better fulfill the organization's mission. According to the literature, increased workforce diversity in public organizations provides many benefits. These benefits include increased production capacity and organizational flexibility, contributions to fairness in the workplace, greater compliance with personnel regulations, increased representation and responsiveness among members of the bureaucracy, and more grassroots support for agency programs and policies. Also, the organization may enhance its reputation and, as a result, be able to attract and keep the best employees.

Unresolved diversity problems, it has been shown, often deflect employee energy and attention from performance, with a consequent loss of productivity, and can cause an organization to lose valued employees. Critics of diversity management sometimes argue that achieving diversity requires an organization to compromise on the quality of its employees or services, but merit should not be an issue if job attributes are well defined and staffing practices are not limited by stereotypes.

Diversity management in the public sector, as in any organization, is a multidimensional challenge that requires permanent and focused managerial attention. Proponents of diversity management suggest that organizations must be able to realistically diagnose the status of their organization to determine the right strategies for diversity management, and several schema have been developed for that purpose.

WORKFORCE DIVERSITY IN PUBLIC ORGANIZATIONS: A NEW IMPERATIVE

The shifts from an industrial to an information-based society and to a service economy have radically challenged assumptions about how to best organize tasks and people. They have also raised demands for organizations to innovate their production functions and to use more diverse talents. Different work arrangements, flatter organizational structures designed around teams and networks, and more permeable boundaries for intra- and interorganizational cooperation have produced a new complexity in work operations. A diverse workforce—in both functional and social terms—becomes a prerequisite for large organizations in both the private and public sectors to manage their turbulent environment.

Workforce diversity has, indeed, become recognized as an imperative for organizational competitiveness and effectiveness,^[1,2] and diversity management is increasingly becoming a principle of human resources (HR) management.^[3] Today, state-of-the-art management literature in both public and private sectors views workforce diversity not as a problem to be managed away but as a requirement of organizational effectiveness.^[2] Traditional affirmative action and equal employment opportunity efforts are no longer viewed as sufficient in themselves to manage today's workforce effectively, even though they may still be an important component of the agenda.

Increased workforce diversity in public organizations, according to the literature, results in ethical, legal, HR management and organizational benefits.^[4] Ethically, diversity contributes to fairness in the workplace, and helps to create economic opportunity and reduce social inequality. Legal and policy benefits include greater compliance with personnel regulations, increased representation and responsiveness among members of the bureaucracy, and increased grassroots support for agency programs and policies. Human resource benefits are an enhanced agency reputation and the resulting ability to attract and keep the best

employees, while promoting creative approaches to work. Organizational benefits are substantial, including increased internal capabilities, greater organizational flexibility and ability to address change and fluidity in organizational design, and decreased discrimination litigation. These claims appear repeatedly in normative and empirically based literatures.

Diversity challenges are compounded in public agencies by specific pressures they face as organs of government. The government environment in the United States is characterized by a changing workforce, declining confidence in government, reduced budgets, downsizing at the federal level, higher demands for productivity, and proposals for alternative approaches to public service, including contracting out and privatization.^[5] In this context, two broad diversity demands affect contemporary public personnel systems. One is the demand for increased performance, whereby diversity becomes a performance requirement; the other is a legitimization demand, in which workforce diversity is a tool to address the political and ethical mandates for a bureaucracy that is representative of the citizenry. Combined, these two demands produce a strong incentive to pursue and manage workforce diversity effectively.

The published literature on diversity is large but limited. In a literature review of diversity, Wise and Tschirhart^[6] found 106 empirical studies of the outcomes of diversity, published between 1961 and 1998 in peer-reviewed academic journals. Thousands of other papers related to diversity and diversity management were published in the same 37 years, but they were mainly descriptive, reviewed ideological or policy perspectives on diversity, or presented survey findings on attitudes toward aspects of diversity. The authors also found that the generalizability of published empirical studies was limited because experimental populations or simulated work situations were most often used in the research. Moreover, published papers tended to be authored by business and psychology professors, with the result that public management issues around diversity were not well addressed. Starting in the 1990s, however, the authors found that scholarly research on diversity began to appear regularly in highly ranked public policy and public personnel journals.

CLARIFYING THE NATURE OF DIVERSITY

There is no single common usage of the concept of diversity in the organizational literature.^[7,8] Simple definitions of diversity most often equate it with variety. Diversity can be studied at a societal level or within particular institutions. Applied to organizational life, there are at least three categories of diversity

related to performance and strategy. These are structural or functional diversity (differences based on organizational functions and tasks such as administrative vs. operational), business diversity (differences in markets, products, and services), and workforce diversity (different types of employees).^[9] At the most general level, Gentile^[2] suggested that in the United States, diversity has become a code word to discuss issues related to how various types of difference impact individuals' and groups' life experiences.

Most of the diversity management literature focuses on workforce diversity.^[8,10] Workforce characteristics can range from attributes directly related to work or tasks such as differences in skills, to those that are social in nature and—in theory—only indirectly related to work, such as gender. There are several types of workforce diversity. Occupational diversity (e.g., locksmiths vs. teachers), professional diversity (e.g., nurses aides vs. registered nurses), and social diversity. The latter refers to variations in the characteristics that identify a person with a social category (e.g., male vs. female). The interdependencies among types of workforce diversity create situations that must be managed (e.g., the experience of a male doctor is different from that of either a female doctor or a male nurse).

The organizational challenges of diversity are based on the existence of documented patterns of exclusion from society's resources along social identity lines. The existence of clusters of jobs occupied by individuals with similar social traits often unrelated to the job, which experts call job segregation, or clusters of persons in occupations and professions who belong to the same identity group, which is called occupational segregation, are well documented.^[11,12] These realities produce differential opportunity in processes and outcomes for members of different identity groups, and thus reproduce inequality.^[13]

SOCIAL DIVERSITY

Research suggests that the salience of an attribute is often socially and historically constructed.^[7,13,14] Social markers include gender, race, ethnicity, religion, sexual orientation, physical ability, and age, as well as family, economic, educational, and geographic backgrounds and status. Some scholars distinguish visible from invisible social dimensions;^[15] others also consider behavioral attributes associated with functional diversity, such as differences in learning, communication, and work styles. Combined, these social attributes produce the "social types" that make up an organization's workforce,^[4] and determine its particular diversity challenges.

For several reasons, social diversity offers the hardest challenges to managers. Social identity

involves both self-definition and attributes perceived by others.^[1] Also, categorizing individuals on the base of a single identity attribute is usually considered detrimental because the parts of peoples' identities occur simultaneously (e.g., a "typical" Latino employee may be a member of certain religion, could be gay or straight, or may have a disability not readily apparent to the naked eye). Tough diversity dilemmas emerge from these social dynamics, and from the interactions between social and functionally related identities (e.g., occupation or position in the organization).

The empirical literature to date does not offer much assistance on dealing with multiple identities. Wise and Tschirhart^[6] concluded that findings about the impact or management of diversity within one group of employees are not generalizable to other groups. They also find that diversity related to educational attainment, work experiences, and tenure with an organization were less studied, and disability was largely absent, as compared with studies of sex, ethnicity/race, and age.

BROAD AND NARROW DIVERSITY MANAGEMENT STRATEGIES

Two distinct approaches have characterized the theory and practice of managing workforce diversity. In the world of practice, a broader definition of workforce diversity emphasizes differences in personality, work style, and visible manifestations of social diversity. In contrast, a narrower definition focuses on social exclusion of what the United States law calls "protected classes," that is, women, racial and ethnic minorities, persons with disabilities (and in some jurisdictions, but not all, gay, lesbian, bisexual, and transgender individuals).

The broader approach places diversity within a context that expands beyond representation and compliance of the law. The narrower approach focuses on efforts to redress existing patterns of inequality and to reduce disparities in the future. Thomas (1991) argued that both approaches are necessary: without rigorous "narrow" efforts to recruit and promote persons not part of the dominant social group, no "new faces" would enter the organization or managerial ranks. However, without a "broad" organizational focus to make the organization a welcoming place to all, the original effort would go to waste. In this sense, the broad and narrow approaches are complementary.

The distinction also appears in the diversity management literature. Work focusing on the practice of managing diversity is normative and emphasizes the broad definition. Empirical research on issues of diversity in the workplace tends to concentrate on specific

dimensions that suggest a narrow approach, such as examining the representation of specific populations or the impact of diverse membership on performance. The distinction stems from the historical development of diversity efforts, from ideological battles fought in that process, and from the way research has followed practice in this area.

In the United States, following the Civil Rights Act of 1964 and the Equal Employment Opportunity Act of 1972, diversity in the workplace was originally measured by counting the number of employees that fit into each of the desired categories. As a result, diversity management is frequently confused with affirmative action. However, since the mid-1960s, three distinct phases of diversity management have evolved. First, affirmative action and equal employment opportunity (EEO) employment policies sought to increase the representation of minorities and women in many areas of employment and to reduce discriminatory practices. Then, as persons from different backgrounds entered, organizations started to try to change their workplace culture via awareness courses and celebrations of diverse characteristics. These activities, known as "valuing diversity," were often isolated from organizational strategy or job needs, however. Later, a new type of effort, known as "managing diversity," started to link changes in work practices to workforce diversity. These new approaches combine solving organizational problems and addressing justice concerns. This points to the need to consider both the ethical and practical drives underlying diversity management. In theory, the phases occur sequentially within the life cycles of organizations, but in practice most organizations will use parts of all three phases simultaneously.

In a final iteration of this development, "diversity management" has become the preferred term, mixing aspects of the narrow and broad approaches. Gilbert et al.^[16] defined diversity management as a managerial principle used to make HR decisions and implement practices that create greater inclusion of all individuals into both formal programs and informal social networks. Meyerson and Fletcher^[17] referred to diversity management as a "persistent campaign of incremental changes that discover and destroy the deeply embedded roots of discrimination" (see Ref.^[17], p. 131).

ETHICAL AND PRACTICAL MOTIVATIONS FOR DIVERSITY MANAGEMENT

The diversity literature highlights ways in which diversity makes good business sense. Public sector scholars promoting the value of diversity have followed this lead under the assumption that managers take pragmatic arguments more seriously than ethical arguments.

It is true that the costs of not attending to workforce diversity can be high. Unresolved diversity problems can deflect employee energy and attention from performance toward justice and fairness issues with a consequent loss of productivity. Poor diversity management can cause the organization to lose good employees and therefore incur the expenses of recruiting and training their replacements, as well as potentially diverting financial and human resources to deal with litigation or to pay punitive damages.^[4,18] But there are also compelling reasons to stress the ethical underpinnings of diversity.

Diversity management is based on the normative assumption that diversity is a value, and that its management requires a commitment to social inclusion and therefore equality. In this sense, diversity refers to the degree to which there is a variety of attributes (including social, cultural, functional) within a particular structure of governance (be it organizational, sectorial, societal), and the extent to which this variety is distributed at all levels of the structure. Equality, in turn, refers to the extent to which opportunities, resources, information, and power are distributed across diverse individuals and groups within a particular structure of governance. Lack of social diversity and patterns of organizational inequality usually go hand in hand.

Gilbert et al.^[16] highlighted the relevance of ethics in diversity by reviewing three ethical principles that support successful diversity initiatives. The first principle is the *Golden Rule*: if you want to be treated fairly, treat others fairly. The second is the *Disclosure Rule*: you must be comfortable with decisions after asking whether you would mind if others became aware of them. The third is the *Rights Approach*, which assumes that people should have the ability to freely choose what they will do with their lives.

Even when the motivation to address the diversity challenge is not ethical, these ethical principles contribute to its successful implementation. Abiding by the first rule, successful diversity programs are inclusive and provide fair treatment to all employees. The openness needed to administer diversity programs responds to the second rule. Diversity management addresses the third rule by allowing people to choose opportunities according to their interests and abilities. If these diversity principles are removed, Gilbert et al.^[16] argued, diversity initiatives will collapse. Critics of diversity management may argue that achieving diversity requires a trade-off between equity, merit, and diversity. Such trade-offs, however, contradict theoretical definitions of diversity. Merit is not at question if attributes of the job and staffing practices are not limited by societal expectations or stereotypes. Equality means that every one qualified to do the job is allowed to do it.

Managers implementing diversity initiatives need to expect some friction even under the most favorable circumstances. The performance and representation requirements for increased diversity in the public workplace generate interpersonal, organizational, and political challenges that require direct managerial attention. Williams and O'Reilly^[7] argued that although diversity increases the opportunity for creativity and the quality of group work, it also increases the likelihood of group conflict, member dissatisfaction, turnover, and failure in the implementation of ideas. Hence, as a “double-edge sword” diversity “requires careful and sustained attention to be a positive force in enhancing performance” (see Ref.^[17], p. 120). It requires careful diagnosis and designing an agenda that is part of a broader framework to enhance organizational performance.

DIVERSITY MANAGEMENT FRAMEWORKS

Proponents of diversity management suggest that organizations must be able to realistically diagnose the status of their organization to determine the right strategies for diversity management. Cox^[1] developed a helpful typology to assess an organization's distance from achieving the goal of diversity. The “monolithic organization” comprises mostly similar employees, and the culture rewards only those who conform to the norms of the dominant group. In such an organization, a person with a language accent may not be promoted as fast as others providing similar input and ideas into the organization's processes. Next, “the plural organization” has a mixed group of employees, but the systems and culture remain dominated by one group. Women who have advanced through the bureaucracy but receive fewer promotions at the higher levels may have hit a “glass ceiling” because predominantly masculine features such as assertiveness continue to be seen as the necessary values for success. In all monolithic and some plural organizations, informal communications, networks, and key decision-making bodies are closed to non-dominant employees. Cox's third organizational type is the “multicultural” organization, in which differences are viewed as potential organizational assets. In these organizations, inclusion and fairness are important values, and this is reflected in the demographic composition of the workforce at all levels.

Locating the organization along the “diversity continuum” (between discriminatory and non-discriminatory, from monolithic, to plural, to multicultural) can help managers to identify methods to pursue their diversity strategy. Ospina^[4] proposed that organizations must differentiate among four consecutive managerial tasks: *considering, pursuing, managing,*

and *maximizing* diversity, depending on the organization's place in the diversity continuum. To overcome the monolithic organization, managers first start by *considering* diversity, that is becoming aware of the costs and benefits of maintaining a monolithic workforce. In *pursuing* diversity, they look for strategies to attract and recruit a diverse workforce, usually starting with EEO initiatives. Once the organization opens up to a more diverse workforce, becoming more plural in nature, leaders find ways to ensure that policies and practices support all employees, thereby *managing* diversity. Finally, managers use diversity strategically to add value to the organization strategic goals by supporting the unique contributions each organizational member of their multicultural workforce brings, independent of their background, thus *maximizing* diversity. As an organization achieves multiculturalism, diversity management also requires looping constantly among these tasks over time, so that the diversity challenge never stops.

In their diversity management framework, Thomas and Ely^[19] differentiated existing approaches to diversity according to the underlying philosophy of the managers involved. Managers pursuing efforts based exclusively in a diversity philosophy seeking proportional representation expect all employees to assimilate to the dominant culture (Thomas and Ely call this the *discrimination and fairness* paradigm). Other managers pursue efforts that acknowledge the strategic function of diversity to target minority consumer groups. In this approach, diverse employees are not allowed to integrate their unique features to the larger organization, but instead are valued only because of their potential to interact effectively with clients of similar backgrounds (Thomas and Ely call this the *access and legitimacy* paradigm). Finally, in organizations where the *learning and efficiency* diversity paradigm is espoused, employees are not pegged to market niches, but are encouraged to use their diverse backgrounds to enhance productivity and to create new opportunities for the organization. These organizations are said to value innovation, creativity, and diversity in problem solving and decision making, independent of each employee's social identity.

Cox's organizational typology, Ospina's developmental tasks, and Thomas and Ely's philosophies represent valuable frameworks to provide guidance to managers in implementing a diversity agenda. The underlying assumption is that diversity is an organizational imperative, not just a managerial choice. For this reason, the responsibility for diversity management must, in a large organization, be shared. Program managers are responsible for developing and implementing the goals of the organization. Personnel managers, in turn, are responsible for the design and maintenance of HR systems that support both the

successful execution of the organization's mission and programs that sustain a diversity philosophy. In partnership, personnel and program managers ensure that the diversity challenge is woven into the organizational goals, its systems and functions, and overall managerial decisions, so that eventually diversity becomes embedded in all practices and routines of the organization.^[18]

DIVERSITY, PUBLIC PERSONNEL MANAGEMENT, AND CIVIL SERVICE

The functional and political requirements for diversity in public agencies take place in a climate where many are questioning the traditional institution of civil service. Originally implemented to increase rationality in public employment, today civil service is often viewed as an obstacle to attaining the flexibility required for organizational adaptation. In addition, some argue that many systems have failed to address problems of social exclusion, political favoritism, and lack of social representativeness in public service.^[13] Although there is no consensus around these claims, there is a generalized call for reforming public employment institutions to ensure they accomplish their role in a democratic society.^[20] Diversity management must be included in any discussion of civil service reform.

Although civil service systems can provide general guidelines to ensure diversity, the specifics of diversity management fall within the purview of each agency because every organization is unique. Ultimately, diversity management in the public sector, as in any organization, is a complex and multidimensional challenge that requires permanent and focused managerial attention. Some civil services do not function well (e.g., where patronage and corruption still predominate in spite of the system), whereas in others the system is functional but has produced exclusionary practices and outcomes. Moreover, in civil service contexts, diversity issues may complicate the managerial requirements to balance contradictory pressures for employee protection and stability required for professionalizing public employment, and demands for accountability and transparency to make public service more efficient.

In this context, a thorough diagnosis to assess workforce diversity problems includes an analysis of the system as a whole, as well as audits of each agency the system regulates. Relevant questions include the extent to which a civil service system promotes both effectiveness and multiculturalism, diversity of the workforce in the entire jurisdiction and its component agencies, and the trade-offs associated with introducing system-wide strategies to promote multiculturalism versus incremental changes to address agency-level diversity problems. Answering these questions and designing a

reform strategy are tasks that require collaboration among actors of the several jurisdictions regulating public employment and managers who need to make decisions to satisfy performance requirements at the agency level.

Ultimately, all stakeholders must strive to design a system of public employment where:

- Opportunities in hiring, compensation, promotion, and personal development are available to all employees across jobs and levels.
- Access to information and networks in an organization are available to all employees across jobs and levels.
- Every employee believes they are treated as a unique individual whose multiple identities and abilities are respected and appreciated for their potential contributions to the organization. In turn, employees see each other and themselves as valuable members of a working community, while still comfortable with and proud of their identities.
- The right policies, systems, and processes exist to ensure the agency's ability to attract, retain, and develop employees with diverse backgrounds.
- Members of the community can see themselves reflected and represented in the workforce that serves them.

In this context, the envisioned workplace is characterized by an organizational climate and an HR management system in which employee diversity becomes a "normal" condition of organizational life.

DIVERSITY AS A WIDER ISSUE FOR PUBLIC ADMINISTRATION AND PUBLIC POLICY

The list of topics to be included in a full discussion of diversity in public administration and public policy is constantly expanding and cannot be limited to workforce considerations alone. The requirement for diversity in public organizations is rooted in both efficiency and the democratic values of responsiveness and representation in public administration. Public agencies have the mandate to represent in their workforce a wide variety of citizens, as well as consider the plurality of values, concerns, and voices of the larger population. Social movements have challenged traditional patterns of exclusion in the most important institutions of society, and it is no surprise that the same happens in work institutions and public employment.

Although the diversity literature has primarily focused on workforce diversity and diversity management, these topics are not isolated from broader discussions about topics such as multiculturalism and participatory democracy. Scholars of deliberative

democracy seek to acknowledge and incorporate different viewpoints in public policy formation. The need for broad representation in democratic decision making and policy implementation makes diverse participation in the policy process a priority for these authors.^[21] Stafford^[22] went even further, arguing that the assumptions and analytical tools used in policy analysis are the product of historical and ongoing processes that exclude certain groups of society, and are therefore not representative enough to serve as the foundation for truly democratic policy decisions. Participatory policy making therefore implies the need for managing diversity among the citizenry and not just the workforce.

If public organizations are viewed as part of the implementation stage of public policy, both workforce variety and diversity in decision making are of concern to all interested is a democratic society. Writers from all points of the political spectrum invoke diversity considerations in most contexts of governance. No current scholar presently forecasts the end of this discussion.

Economic Development and Organization

C. Fred Baughman

*Department of Public Administration, University of Central Florida–Daytona Beach,
Daytona Beach, Florida, U.S.A.*

INTRODUCTION

A new trend within the economic development profession is the reconsideration of the organizational form of local economic development agencies. Recently, the Fort Wayne–Allen County Economic Development Alliance was established as a partnership between the City of Fort Wayne, Allen County, and the Greater Fort Wayne Chamber of Commerce. Before its creation, each of the three entities had its own economic development staff.^[1] This is an example, therefore, of governmental and private sector agencies combining to form a public/private partnership.

However, not all recent reorganizations have been in that direction. The local elected officials in Volusia County, Florida, withdrew their financial support from the existing public/private partnership (Enterprise Volusia, Inc.). Instead, Volusia County is going to create an in-house economic development department. Because of concern by the private sector in regards to the public sector's ability to accomplish effective business recruitment, three of the local chambers of commerce within Volusia County have also formed an alliance to perform business attraction activities. This is an example, consequently, of a public/private partnership being split into separate governmental and private sector economic development entities.

HISTORICAL PERSPECTIVE

Historically, the source of funding has played an important role in the type of economic development activities within a community. Due to federal funding, many local planning offices were involved in the preparation of economic development planning documents in the late 1970s. Economic development committees were established to prepare Overall Economic Development Programs (OEDP) funded by the U.S. Economic Development Administration. In addition, again because of the availability of federal funding, many local governments were involved in urban renewal efforts that improved the real estate of communities.

However, the actual implementation of business recruitment efforts, in order to create new local jobs, was normally the role of the chamber of commerce

(private sector). Other non-profit organizations were formed to take advantage of programs from the U.S. Small Business Administration. Communities began, therefore, to form revolving loan programs as incentives for development, oftentimes targeted to minority- and women-owned businesses.

As federal funds became scarce for economic development activities, the trend was toward the creation of public/private partnerships, where both entities have a stake in local economic development efforts. The public and private sectors would provide funding for the economic development activities, however, the percentage of the contribution from the sectors was different in various organizations.

Currently, local economic development organizations can be divided into three categories: public sector agencies, private sector organizations, and public/private partnerships.^[2] No matter which form of economic development entity is established, each will have its own advantages and disadvantages. The local community must decide which form fits best with local needs.

PUBLIC SECTOR AGENCIES

Some communities believe that economic development is most effective when accomplished by an agency that is an integral part of local government (city or county). The public sector agency model of economic development organization is unique in that it is funded and directed entirely by the public sector. The local elected politicians provide the policy direction for economic development. In addition, through the annual budget process, they appropriate the available funds for economic development efforts. The economic development staff that carries out the required activities is composed of government employees that report directly to the local elected officials.

Advantages of the Public Sector Agency

Secure source of funding

There is a more secure source of funding for economic development efforts. This source might come from the

general fund of the local government. Other communities have established impact fees to support economic development. The State of Indiana allows its counties to create an Economic Development Income Tax (EDIT). No matter what the source of the funds, economic development staffs in governmental agencies are not expected to be involved in fund-raising activities.

Proximity to decision makers

Most financial incentives in economic development projects come from the public sector. If the economic development organization is a governmental agency, then it is much closer to the decision makers that will commit those incentive dollars.

Interdepartmental cooperation

Similar to being closer to incentive decision makers, the staffs of public sector economic development agencies work closely with other governmental departments. Many times, an economic development deal will require the cooperation of other departments for permit approvals or infrastructure improvements.

Citizen participation

Another advantage of public sector economic development agencies is the legal requirement for citizen participation. This requirement ensures that the economic development staff is not acting in a manner contrary to the overall vision of the community.

Disadvantages of the Public Sector Agency

Timing of economic development projects

Many local officials are elected to two-year terms. Consequently, those local elected officials focus on programs with quick results. However, economic development is not an activity that normally produces benefits in a fast time frame. From the time that an economic development staff begins talking to a business prospect until that business makes a locational decision can typically be from two to four years. Therefore, local elected officials creating an economic development agency, and making annual budget appropriations, might not see a successful economic development project during their term in office. It is commonly believed that local elected officials often-times support those activities that get them reelected. David Osborne and Peter Plastrik, in their book, *Banishing Bureaucracy*, indicate that leaders of the future are going to have to be committed, “willing to stick it out...willing to invest the time it takes to

communicate their vision; and if they can prove themselves...they can succeed.”^[3] There is no guarantee that economic development efforts can produce desired results in the short run—elected leaders are going to have to take a long-term perspective.

Political infighting

Another disadvantage of public sector economic development agencies is the local infighting between political organizations. For example, if the leadership of a local city is politically different than the leadership of the county, then there might not be the cooperation required for a successful economic development program by either entity. In addition, the infighting within a political organization can have just as serious consequences. The lack of political leadership can be a large disadvantage for a public sector economic development agency.

Inefficient government structure

An inefficient government structure can also be a disadvantage. As stated earlier, an advantage of the public sector agency was its closeness to decision makers. However, if the organizational structure of the government does not allow for this proximity, then the advantage is no longer realized. Therefore, economic development staffs should not be buried in an umbrella department. In addition, it should be recognized that the motivating factors of planning staffs and economic development staffs are very different. While both groups should pursue smart and managed growth, the economic development staff will normally be promoting growth, and the planning staff will normally be constraining growth.

Governmental bureaucracy can be a limiting factor to the success of economic development efforts. The saying “time is money” is never more true than in the area of economic development. Business prospects expect, and require, the immediate turnaround of information and decisions. Any delay in the opening of a new business is an opportunity cost to that company.

Public disclosure requirements

A further disadvantage of a public sector economic development agency is public disclosure requirements. These are commonly known as “Sunshine Laws.” The overall concept of sunshine laws is positive in its belief that the activities of government should be conducted in the public view. However, most business prospects demand confidentiality during the early stages of the economic development process. For labor and market reasons, it is important for them that information of their potential relocation does not become public.

The sunshine laws place a public sector economic development agency in an uncomfortable position.

Ability to attract professional staff

The final disadvantage of the public sector agency is its ability to attract and retain competent economic development professionals. This constraint might be because of the pay level of other city staff members or just of the legal structure of the human resources procedure required of governmental entities.

PRIVATE SECTOR ENTITIES

As stated above, early in the formation of the economic development profession, most business recruitment activities were done by the local chamber of commerce. In some communities, the chamber of commerce is still the focal point for economic development. The private sector entities obtain their leadership, agenda, and funding entirely from private enterprise. Oftentimes, this leadership is composed of real estate brokers, attorneys, bankers, accountants, and small business owners. Not surprisingly, these individuals see a direct potential business benefit from successful economic development efforts.

Advantages of the Private Sector Entities

Freedom from governmental legal constraints

The first advantage of the private sector organization is its freedom and the fact that it is not constrained by the many legal structures of local government. Those constraints might be procurement procedures, personnel regulations, sunshine laws, and others. Another related advantage is the private sector's ability to recruit and compensate talented economic development professionals.

Not part of the government organization

By being outside the governmental structure, the private sector organization can often act as an ombudsman during the economic development process. If a project gets held up in government "red-tape," then the private sector organization can use steps to remedy the problem without worrying about hurting the feelings of government employees. This type of organizational entity does not require the government to "police" itself.

Able to respond quickly

As stated above, timing is often critical in economic development activities. In many cases, the private

sector will respond more quickly and is more efficient than the public sector. As Osborne and Plastrik state, "The problem with government monopolies is that they have no real reason to improve their performance."^[4]

Disadvantages of the Private Sector Entities

Responsiveness to community sentiment

One of the disadvantages of the private sector organization is that it can be less responsive to the community sentiment for economic development.

Conflicts of Interest

Another disadvantage is that the private sector leadership might have a conflict of interest when it comes to economic development projects. Even though a project might be a benefit and create many well-paid jobs for the community, some private sector leaders might not support the project because of the competition it creates for their own labor force needs.

Secure funding sources

The final disadvantage of the private sector economic development organization is that the funding stream is less secure. Rather than a dedicated source of funds, most private sector organizations rely upon fundraising for their budgetary needs. Consequently, a staff hired for economic development expertise can spend a considerable amount of time instead on organizational fund-raising activities.

PUBLIC/PRIVATE PARTNERSHIP

The public/private partnership is the form of organizational structure most recently preferred by many communities for economic development activities, because it can combine the advantages of the public sector agency and the private sector organization. As the name implies, the public/private partnership is a collaborative effort of the public and private sectors. It is estimated that over 80% of current organizations have a board of directors comprised of members from the public (government) and private sectors.^[5]

Advantages of the Public/Private Partnership

Vehicle for communication

One of the main advantages of the public/private partnership is that it provides a vehicle for the interaction

between local government officials and leaders in the private sector. This may be one of the few opportunities within the community for this type of interaction to occur. Consequently, the public/private partnership has the opportunity to maximize the powers of the public and private sectors.

Broader base of funding

Economic development activities are becoming more expensive. Funding of the public/private partnership normally comes from both sectors but can be contributed at different percentages. The specific strengths and weaknesses of the local community will assist in establishing that ratio for the organization. However, less time will be spent on fund-raising than in a fully private sector organization.

Need for confidentiality

As stated earlier, the economic development prospect often requires total confidentiality in regards to its interest in a potential relocation. Because of "sunshine laws," the government entities are not able to provide this needed service. As a result, the prospect will many times communicate with a public/private partnership much earlier in the process than it would with a strictly public sector organization.

Disadvantages of the Public/Private Partnership

Multiple sources of responsibility

The primary disadvantage of the public/private partnership is that the economic development staff may be forced into a position of reporting to multiple "bosses."

Project coordination

Another disadvantage is that unless all the entities involved in the partnership trust the process, there may be charges of leads being steered to certain locations. The professional staff will need to establish a lead-sharing procedure and rely heavily upon it.

CONCLUSION

As stated earlier, every type of organizational structure will have advantages and disadvantages. Again, the individual strengths and weaknesses of every community will be important in determining the economic development organizational structure that is most effective. A recent article comparing the St. Paul model

(public sector agency) to the Philadelphia model (public/private partnership) in conclusion stated, "We think the quasi-public corporation, with its legal flexibility and combination of public and private resources, offers the broadest range of powers and the strongest opportunity for coordination between the public and private sectors. Although independent to some degree, it also recognizes its responsibilities to both sides—to the private sector in creating a favorable business climate and to the public sector in creating job opportunities and improving the city's tax base."^[6]

In general, therefore, the trend is toward the public/private partnership because of its ability to contribute the advantages of the public sector agency and the private sector organization while minimizing the disadvantages of both. Dr. David Kolzow recently concluded, "the advantages of teamwork in the local economic development process are becoming increasingly apparent in the face of changing economic trends, budget constraints, and the growing need for the combined resources of the private and public sectors. Communities in which the public and private sector band together to form economic development teams through an organization structured as a public-private partnership are more likely to experience effective actions and successful results."^[7]

INTRODUCTION

The 1990s witnessed an increased interest among policy makers, scholars, and advocates in expanding and deepening citizen participation processes, particularly in community and economic development activities. The Bush Administration, early in its tenure, philosophized about the idea of a “citizen-centric” government. The Clinton Administration, under the leadership of Vice President Al Gore, worked on numerous citizen participation initiatives as part of its “reinventing government” program. Scholars, most notably, Robert Putnam, in books such as *Bowling Alone*,^[1] called attention to the decline in civil society. Redburn and Buss, in their monograph, *Modernizing Democracy*, called attention to the power of new information technology and the Internet to engage citizens in public life in more sophisticated ways, and outlined a program to accomplish this goal. Advocates, such as the Orton Family Foundation, have invested heavily in the development and marketing of software—*CommunityViz*—to improve the quality of citizen deliberations on community and economic development policy and programming (www.communityviz.com). Representatives from neighborhood groups, the planning profession foundations, think tanks, and universities met in Tampa in January 2002 to form a national association to raise the visibility of and expand opportunities for citizen participation in building communities (www.PlaceMatters.com). Hundreds of web sites on citizen participation now dot the Internet landscape (e.g., www.democracyinnovations.org).

This article first examines reasons why many want to deepen and expand citizen participation processes. Next, it looks at mandates requiring citizen participation processes at the local level, especially those that are part of public programs for economic and community development. Then the article discusses different modes of citizen participation, evaluating

the advantages and disadvantages of each. The entry concludes with an overview of the issues in the design and administration of citizen participation processes intended to support community and economic development.

WHY DEEPEN AND EXPAND CITIZEN PARTICIPATION?

Influential Movements

Thomas Jefferson once pointed out that if the people appeared not enlightened enough to exercise their control of government, the solution was not to take away the control but to “inform their discretion by education.” The cooperative processes that are springing up around the country are doing just that, giving to large numbers of citizens a new comprehension of the complexity involved in government decisions, out of which has got to come a heightened appreciation of, and tolerance for, the necessary work of government. If these processes work, if they spread, if they become an indispensable part of government at all levels, we may take it as a sign that we, as a people, have moved up a grade in democracy’s school. It holds out the hope that, eventually, the United States will be ready for self-government.

—William Ruckelshaus,
Restoring Public Trust in Government,
National Academy of Public Administration,
November 15, 1996

Political theorists—Robert Dahl, Charles Lindblom, Mancur Olson, William Riker, Anthony Downs, and Alexis D’Tocqville, to name a few—have long been interested in citizen participation as a requisite for democracy. There is no single source for the explosive rise in interest in citizen participation, especially in

community and economic development. But we suspect that five independent, although interrelated, forces are at work: a renewed interest in democracy, likely arising out of efforts to assist former Soviet Bloc countries in their transition away from communism; a concerted effort, now worldwide, to “devolve” government as close to the people as possible; the “reinventing government” movement, almost single-handedly launched by David Osborne in his books, *Laboratories of Democracy*^[2] and *Reinventing Government*;^[3] anti-corruption and civil society movements promoted by multilateral and bilateral aid organizations in the Third World; and interest in collaborative shared decision-making models of government inspired separately in business management and public administration leadership literatures (e.g., Refs. ^[4] and ^[5]).

American experts, helping to rebuild societies in Russia, its former republics, and Eastern Europe, not only engaged in serious thinking about how to build democracy and economic reconstruction in these countries, but they also called into question how democratic countries in the West really were. The Open Society Institute, based in Budapest, Hungary, and funded by the Soros Foundation, is a think tank devoted to issues of democracy, particularly citizen involvement in redirecting local economies Eastern Europe and Russia (see www.osi.hu). The World Bank, United Nations, and other multilaterals, not to mention efforts across the United States, have extensive programs to decentralize government, devolving power to local people. Micro-credit programs targeted at poor neighborhoods and villages as a community/economic development tool is but one example.^[6] Anticorruption is a major thrust of World Bank development policy. The World Bank Institute offers a technical assistance and training program—specializing in fiscal decentralization and economic development—to empower local decision making on public expenditures (see www.worldbank.org). The reinventing government movement, a descendent of past “good government” and reform movements, is a focus of a National Academy of Public Administration’s Alliance for Redesigning Government in its efforts to build capacity for community development (see www.alliance.napawash.org). The Pew Trust has in place a nationwide project, the Civic Entrepreneur Initiative, to promote local leadership (see www.pew-partnership.org).

Goals

The rationales offered by these five sources of new interest in citizen participation illustrate the diversity of motives and perspectives from which it can be argued that citizen participation processes ought to be expanded and deepened.

Making democracy more democratic

In democratic theory, popular sovereignty refers to the capacity of a people for independence and self-government. Modern American democracy boasts, according to Schattschneider, only a “semisovereign” people, dependent on an expansive, paternalistic political elite intent on reducing deliberative forms of participation.^[7] Expanding and deepening citizen participation is a way to make democracy more democratic—that is, direct, deliberative, and participatory. As Thomas Jefferson so aptly stated, “[there is] no safer depository of the ultimate power of society but the people themselves.”

Redefining power structures

For some, increasing citizen participation among selected underrepresented groups is a way to redistribute power.^[8] The Administrative Procedure Act of 1946 required federal agencies to submit their proposed regulations to public review for the first time. The Housing Act of 1954 expanded participation for the general public by requiring agencies to appoint citizen advisory committees as a prelude to undertaking community development activities. In the 1960s, civil rights legislation enfranchised many Black voters and struck down legal barriers to participation. The Johnson Administration’s “War on Poverty” programs under the Equal Opportunity Act of 1964, at the same time, briefly challenged many existing power structures, supporting emergent local organizations with federal funds in an effort to create “maximum feasible participation.” Community action agencies, still functioning today, gave many poor people “voice” in local development efforts. The decades following saw the empowerment of groups concerned about local issues, including for our purposes, environmental, planning, zoning, and land use. Citizen participation occurred first through litigation, then through legislation and executive order, requiring nearly all federal agencies to facilitate citizens’ input. Executive Order 12898, *Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations*, for example, mandates meaningful participation and access for minorities to resolve issues such as toxic waste dump location decisions.

Enhancing credibility

Many believe that governments that reach out to citizens will likely gain credibility from greater openness, transparency, and responsiveness. When government is credible, citizens will support government programs, projects, or initiatives. Today, much social science research finds a public increasingly alienated and

disconnected from government at all levels. Less than one-half of registered voters have bothered to show up at the polls since the 1960s. According to monthly “tracking polls” conducted by Harvard’s Shorenstein Center on the Press, Politics, and Public Policy, less than one-half of voters, when asked in the months preceding the 2000 campaign, thought about or discussed the campaign. Reengaging alienated citizens is a challenge to those who seek to restore government’s credibility.

Managing conflict and building consensus

If everyone agreed on public issues, there might not be a need for government. Because people do not agree, citizen participation processes may be useful in either building consensus or resolving conflict.^[9–12] The 1980s brought an increased focus on “stakeholders,” and precipitated efforts to get those most affected by public policy to at least be consulted and at most to have a say on outcomes. Analysts soon discovered that involving stakeholders in public decisions was perhaps a necessary condition, but not a sufficient one for developing consensus. Involving stakeholders who disagreed with one another often caused more rather than less problems for public officials. For example, in the U.S. Northwest, farmers wanting to divert water for irrigation, Native Americans desiring to fish depleted waters, environmentalists seeking a primeval environment, and developers promoting development all came into conflict over future economic development of a river region. Where disagreements tended to be intense, as say with environmental issues, new methods for resolving disputes and mediating disagreement were tried. The Environmental Protection Agency (EPA) recognized the need to create an office of conflict resolution.

Feedback

The most sought-after product of citizen participation and the least controversial is the opportunity it affords to allow citizens to provide valuable input on how programs or policies should be crafted, how well they work, and how they might be improved. The notion is that citizens as consumers are best positioned to answer these questions. A major development in this area is the citizen satisfaction survey in which government asks a representative group of citizens formally for feedback on services, in the same way that businesses do. Many community development agencies, for example, periodically survey citizens to gain insight into their needs and expectations.

Accountability

Accountability of public officials for the decisions they make and the services they provide is a major goal of

citizen participation processes. If citizens have a say in government, they can influence decisions more frequently and more specifically than simply voting in elections. Public officials who know that citizens are engaged will likely make better decisions.

MANDATED CITIZEN PARTICIPATION PROCESSES

At the federal, state, and local level, few mandates compel local public officials to engage extensively in promoting and using citizen participation processes. Those mandates that do have the force of law are limited, discretionary, and flexible. Transportation planning in Oregon State and economic and community development planning at the Department of Housing and Urban Development (HUD) are illustrative.

Oregon has a long history of citizen participation mandates.^[13] In the 1970s, Oregon created the Land Conservation and Development Commission (LCDC) specifically to create the “opportunity for citizens to be involved in all phases of the [transportation] planning process” (p. 7). In 1990, LCDC and the Oregon Department of Transportation developed the *Transportation Planning Rule*, which put even more responsibility on agencies to elicit citizen input. Over time, citizens in Oregon have developed high expectations of government at all levels. Many professionals believe that Oregon leads the nation in citizen participation applications.

Department of Housing and Urban Development’s Community Development Block Grant (CDBG) program, a \$4.4-billion flexible funding source for community and economic development projects in 50 states and more than 1000 local “entitlement communities,” administered by the Office of Community Development and Planning (www.hud.gov). The *Code of Federal Regulations* [24 CFR 91.105] requires a strategic plan—“the Consolidated Plan”—that includes a citizen participation component allowing citizens to help in developing, amending and evaluating CDBG projects. People with low and moderate incomes, particularly those living in slums or blighted areas, represent a special focus. Entitlement communities must take “whatever actions are appropriate to encourage the participation of all their citizens, including minorities and non-English-speaking persons, as well as persons with disabilities.” Entitlement communities must hold at least two public hearings annually, one hearing must be scheduled to allow citizens to participate in plan development. Entitlement communities meet publication requirements by publishing a plan summary in a general circulation newspaper and by making copies of the plan available at libraries,

government agencies, and public places. Entitlement communities must follow their citizen participation plans, but amendments are permitted as long as public comment is invited. Citizen participation requirements cannot restrict the responsibility or authority of an entitlement community for the development and execution of its plan.

At the local level, few communities mandate specific citizen participation processes, except for hearings on budgets, land use planning, and the like. Most citizen participation activity is mandated by either federal or state law or regulation.

MODES OF CITIZEN PARTICIPATION

A panoply of options exists to satisfy citizen participation requirements under law or because they are considered desirable in themselves (see, e.g., Ref.^[14]).

Referendum, Initiative, Recall

At the state and local level, the oldest and perhaps the most basic form of citizen participation is a vote in a general or special election. Citizens typically vote on the performance or expected performance of candidates for public office. In rarer cases, citizens may be asked to pass or defeat referendums or initiatives on issues—citizens may unite to put their own issues on ballots—that have policy implications. Only 21 states have both a referendum and initiative option, 2 have initiatives only, 3 referendums only, and 18 neither option (www.iandrinstitute.org). Or they may vote elected officials out of office—recall—before their terms are up. Although elections are at the heart of democracy, they do not allow citizens to participate except by giving thumbs up or down. Some argue that the referendum process has been largely co-opted by monied interests able to influence electoral outcomes through sheer spending.^[15] In any case, elections may be a necessary condition of citizen participation in democracy, but are not sufficient in any sense. They also are not terribly relevant in community and economic development locally where most activities are project based and not the proper object of elections.

Hearings

Public hearings are the most common form of citizen participation in practice, at least locally. Virtually every unit of local government must hold hearings when plans are developed, projects are approved or amended, or budgets are proposed or revised. In many cases, federal, state, and local units of government may mandate hearings. Department of Housing and Urban

Development requires hearings on its Consolidated Plan, states require a hearing on matching funds tied to federal funding, and local governments may require hearings on federal and state funding allocated to the local budget, for example. Although the most frequently used form, hearings could be the least effective vehicle for citizen input. Typically, hearings are poorly attended and citizen comment is likely not representative, even when millions of proposed expenditures on economic and community development funding are at stake. Hearings are also risky for public officials because they are impossible to control—anyone can say just about anything, all before the mass media. Most officials can recount horror stories about how an angry citizen unexpectedly derailed a “safe” project in a hearing. The setting encourages posturing and discourages dialog and new thinking. For most hearings on economic and community development projects, public officials do not want fully developed projects changed or rejected in final stages after a great deal of effort has been expended. Perhaps this is why public officials view hearings as a pro forma requirement to get out of the way.

Advocacy Group Influence

Since the 1960s scholars (e.g., David Truman’s, *The Governmental Process*) have pointed out that interest groups have come to dominate citizen participation processes, usually around a narrow set of issues or programs that directly concern their members. For instance, directors of state-level community development agencies, such as the Council for State Community and Economic Development Agencies, lobby HUD on community and economic development issues, on everything from lead abatement in housing projects to management information systems used in reporting block grant expenditures. Although advocacy group input is important—these groups often have the expertise and information necessary to make good policy decisions—they may dominate citizen participation processes so much so that the process becomes lopsided. At HUD, for example, only two groups are mandated to be included through outreach in citizen participation processes in HUD’s CDBG grant—labor unions and the disabled community. All other groups must rely on their own devices to be heard.

Surveys and Focus Groups

Increasingly, communities are turning to surveys and focus groups as a preferred mode of citizen input (e.g., Ref.^[16]). Surveys, by telephone, mail, e-mail, group distribution, or in person, afford policy makers the opportunity to elicit large amounts of information

from representative groups of people at relatively low cost. Their disadvantage is that they are highly structured and not especially rich in the information they produce. Focus groups—small groups of people whose interaction yields rich information—often supplement survey information as a mode of input. An issue with surveys and focus groups is that they have become a kind of barometer used by public officials in decision making. In other words, decision makers decide based on trends in polls and focus groups. However, polls and focus group data may tap fickle opinions that can vary greatly in a short period of time. This is the case in Boston's \$15-billion "Big Dig" transportation/economic development project since the 1990s (www.bigdig.com). Public opinion support ebbed and flowed as bridges, highways, and tunnels appeared, while neighborhoods were disrupted; billions in cost overruns were reported; and dust, noise, and water pollution become commonplace.

Meetings/Workshops/Retreats

Meetings, workshops, and retreats are increasingly popular as ways to involve citizens in governmental decision making. These modes are most often used to gather information from citizens or provide them with it, greatly limiting their utility. Even so, these methods are especially useful in economic development where maps, models, and other visual aids are necessary.

Neighborhood/Community/Citizen Advisory Boards

Some communities formalize citizen input into programs or policy areas by creating special boards that offer input into planning processes. Boards do not have decision-making authority (these should not be confused with zoning or planning boards, which do have authority to make decisions). Boards typically strive to be representative of communities or neighborhoods by including one or more "stakeholders" from each group likely to be affected. The problem with

boards is that they cannot really be representative of neighborhoods, except in some nominal way. Board members also tend to have different values than either elected officials or the general public.^[17]

Group Facilitation

Group facilitation modes have been around for decades, but seem to be enjoying a renaissance in the last few years.^[18] Most methods have in common that citizens are chosen to participate in a process over time in which they reach consensus on problems and solutions (see Table 1 for a list of large group process methods). Public officials may participate in groups as members. The latest innovations in group methods have to do with increasing dramatically the number of participants to give their deliberations more credibility and to increase diversity of opinion. A shortcoming of group methodologies is that on the whole they have never undergone widespread scientific evaluation: What works and why? Are group methods superior to other methods? It's unclear whether the numerous techniques available are really different or just boast different "brand names."

Complex Voting/Computers/Internet

E-government is a high priority at the federal level, as well as at state and local agencies. At present, e-government focuses on the development of web sites to disseminate information to the public and e-mail links to elicit citizen feedback.^[19] Fourteen counties in northwestern Georgia, for example, linked together in the Growth Management Initiative web site to provide a forum on growth/antigrowth issues in a project funded by the Appalachian Regional Commission (www.arc.gov). Although common, these methodologies do not yet take full advantage of new technology. High-speed commuters, sophisticated decision-making software, and Internet access could revolutionize citizen participation processes. Citizens working at terminals, for instance, could participate in inexpensive sophisticated simulations and decision-making games and activities.^[20] However, even this method of citizen participation can be problematic. No matter how simple or user friendly, some individuals may be excluded as participants.

CITIZEN PARTICIPATION PROCESSES IN ACTION

Despite the varied options available to public officials to improve access to government, there is wide

variation among communities in the extent to which they promote citizen participation opportunities. We believe that most communities offer minimal options; consider HUD's programs. As required by law, all entitlement communities must have at least two hearings related to the Consolidated Planning process. Many communities create citizen advisory boards, composed either of neighborhood residents or community representatives, including advocacy groups, citizen groups, nonprofit agencies, and the like. Many communities conduct surveys or focus groups to elicit citizen input. These can take many forms, ranging from narrow attempts to identify specific needs to more global looks at community development issues. Judging from HUD's Best Practice Awards program in the recent past, the latter activities are uncommon enough to enjoy the status of "best practices" (see HUD web site, "Blue Ribbon Practices in Community Development").

Richmond, California, for example, received a citation for best practice in citizen participation, stated as:

The City undertook a number of activities to expand and enhance citizen participation in the Consolidated Planning process. The City formed a Consolidated Plan Advisory Task Force that was made up of citizens, including Public Housing Authority residents and members of neighborhood councils. The Task Force reviewed drafts of the Plan and provided suggestions for improving the document. In addition, the staff of the Task Force brought together an inter-departmental working group and a variety of other agencies.

Columbus, Ohio's efforts under CDBG, by contrast, are exemplary. They distributed 10,000 surveys, door hangers, and fliers. They visited dozens of nonprofit, social service agencies, and public places (e.g., shopping malls) to elicit input. They set up community information hotlines; held numerous community forums, inviting citizens to attend by letter invitation; sent out direct mailings; and provided information to the mass media.

ISSUES

Because citizen participation is not straightforward in any sense, the following issues will always be of concern.

Defining Stakeholders

Most modes of citizen participation depend on targeting certain kinds of stakeholders who will participate.

But how should "stakeholders" be defined? An obvious way is to determine who is most affected by development activity, then bring them to the table. Who is most affected is always relative. Is it persons directly or indirectly affected? Are those who are slightly affected but intense considered, and consequently some will be excluded or included "inappropriately" in the process? Are taxpayers who will be asked to pay the bill stakeholders? Is impact enough or should it take into account severity of impact? The list of qualifications is endless. Once defined, how should stakeholders be identified? Should stakeholders those in certain demographic groups (e.g., age, race, language, ethnicity, income), residents of an area, or both. Definitions lead to more or less inclusion or exclusion. For example, HUD encourages communities to establish neighborhood strategy areas to address the needs of the poor. However, there are few areas with relatively large homogenous populations. Rather there is usually a mix of low- and moderate-income people, and even high-income people occasionally, all with a "stake" in development.

Decision-Making Authority

Many advocates want to see citizen participation processes have more "teeth" when it comes to implementation,^[21] but this is a double-edged sword. Why should citizens participate if their deliberations are not taken seriously? The other side of the coin is that elected and appointed officials are in office to make decisions. If they do badly, then citizens might vote them out. Laws and customs requiring citizen participation processes greatly favor the latter. An untenable situation exists when citizens devote inordinate amounts of time to providing input only to find it rejected. Some public officials desire to change this. In Seattle, Mayor Paul Schell inaugurated his "city of choices" initiative in which citizens provide early input on economic and community development issues that are then implemented by the city. Public officials gave citizens in Eugene, Oregon, control over small grants for community/economic development as a start in citizen empowerment.

Bad Advice

Public officials often eschew citizen participation processes because they want to avoid bad advice, especially publicly given. Although this seems reasonable on its face, it denies citizens their right to be heard—often and vociferously. It also is highly paternalistic, assuming that elites are much more likely to be "right." An emerging trend in this field is the notion that public officials are unreasonably afraid of

the public mostly because these officials have not received the training necessary to manage citizen participation processes effectively or to their advantage. Bramson advocates training public officials in the art and science of engaging citizens in a dialog, under the assumption that public officials have unfounded fears about engagement that might be overcome through learning and training.^[22]

Necessity to Triangulate Methods

Importantly, although there are numerous ways to engage citizens in the workings of government, employing only a handful of methods is not sufficient to fulfill the requirements of democracy. Different methods reach only selected people, but equally important, different methods when applied to the same people sometimes yield differing results. A survey and focus group methodology applied to residents of a neighborhood can easily produce different, perhaps conflicting, results. The dilemma for public officials is what methods to choose and how to interpret results. The best approach is to engage in as many methods as possible then reconcile disparate results where appropriate by bringing in additional information or consulting experts, or gathering additional input. However, this can be expensive and time consuming, not to mention complicated.

E-government

E-government, even in its most sophisticated and technologically advanced aspects, for many tends to be viewed as another way to facilitate citizen input. Although this is the case, e-government, according to columnist Neal Peirce, should not be considered a convenience, but rather a way to personalize government and make it more responsive, even for people of little wealth or influence.^[23] Viewed in this way, it could become essential as an expression of a properly functioning government. However, it will take considerable effort to move from convenience to responsiveness.

Planning v. Participation

Some argue that citizen participation and planning processes are in continual tension, so much so that the former is the Achilles heel of the latter.^[24] Citizen participation improves democratic processes, while planning mostly involves negotiation; relies on formal processes, while planning is much more informal; and is inclusive and routinized, while planning is selective, changing, and flexible. Citizen participation is, by

definition, transparent, while planning may occur, for legitimate reasons, behind closed doors. The implication is that effective citizen participation may lead to ineffective planning.

Evaluation

In spite of mandates for and the prevalence of citizen participation activities across the United States, few have ever been formally evaluated (e.g., Ref.^[25]). In part, public officials do not see the need to evaluate citizen participation processes, believing that investing in evaluation reduces funding available for programs, and may not want to know what works and what does not. These arguments against evaluation are unfounded. Evaluation can help to determine what works and what does not so that funding from all sources can be better spent. If performance-based management, grounded in goals, objectives, and outcomes is meaningful for program implementation, then evaluation of citizen participation processes would be critical in determining all phases of the policy process—design, implementation, evaluation, and feedback.^[26,27] Most federal funding and a great deal of state funding allows for and encourages expenditures for administrative costs, including evaluation generally and citizen participation specifically. Communities spend a lot on administration: why not channel it into evaluation. Public officials may not want to be held accountable, but if they are not, change will likely not occur. Citizen participation is the engine of change and must be done effectively—good or bad.

Inappropriate Citizen Input

Some argue that a few policy issues defy any rational use of citizen participation processes. These issues tend to be those that are complex, time sensitive, secret, or proprietary. The EPA exempts many of its policy issues from citizen input because administrators do not believe that people are sophisticated enough to understand the science and that people in any case would not have sufficient time to review and absorb documents necessary to acquire the scientific knowledge. The Defense Department, State Department, Federal Bureau of Investigation, Central Intelligence Agency, and numerous other agencies may exclude citizen involvement because of the sensitive nature of the policies (e.g., war and peace) being deliberated. All agencies may face time pressures on some policies (e.g., natural disasters) that preclude public comment. Aside from national security issues, exempting citizens for expediency's sake from input is likely overstated.

Promoting the Idea of Citizen Participation

Assuming that expanding and deepening citizen participation opportunities is desirable, who should take the lead in making it reality? Foundations and government agencies can fund demonstration projects to draw attention to the issue (www.pew-partnership.org). Universities, foundations, advocacy and professional groups, and government can publish best practice information for wide dissemination (e.g., www.hud.gov). Federal agencies can provide grantees, say under CDBG, with incentives to undertake citizen participation activities. Federal agencies or Congress could expand regulations to require greater participation opportunities. Perhaps what is also needed is a national, federally funded organization charged with promoting citizen participation nationwide. It is ironic that no such agency now exists, considering that America is a beacon for democratic practices, yet itself has a considerable way to go. The U.S. funds such an agency—Institute of Peace—for countries in transition, but not for our own country (www.usip.org).

CONCLUSION

Citizen participation is essential in any democracy, but must continue to be nurtured. Renewed interest in citizen input makes this a propitious time to experiment with methods to expand and deepen opportunities for citizens to interact with their government on economic and community development issues, and also other agendas. With computers, software, and the Internet the options are limitless, but a concerted effort in government and the public must occur.

Economic Development, Community Organizations and

Herbert J. Rubin

Department of Sociology, Northern Illinois University, DeKalb, Illinois, U.S.A.

INTRODUCTION

In conventional economic development programs, locales rely upon a variety of incentives to compete with one another to attract upscale office, research, and commercial properties to downtowns and to suburban commercial, industrial, and research parks. As a consequence of these economic development efforts, public wealth is transferred to established firms, while the economic needs of older, industrial, inner-city neighborhoods already harmed by structural changes in the economy are neglected.^[1,2] Scholars and activists argue that an alternative approach toward economic development—one in which concerns with social equity, of helping the poor and poor neighborhoods—predominates.^[3,4]

Unfortunately, the administrative complexities of implementing equity economic development within disadvantaged neighborhoods can be daunting. Projects tend to be small, provide little publicity for elected officials, and are undertaken in the neighborhoods with which most public officials are least familiar. In addition, in inner-city neighborhoods, individuals face numerous social problems that complicate the efforts to bring about economic repair.

To bring about equity in economic development, activist scholars suggest following a “community option in urban policy” through which “local services and redistributive subsidies, along with decision-making authority and accountability, might be decentralized...from public to community-based organizations.”^[5] With the community option, the public sector is not directly involved in programs of neighborhood repair, but instead it facilitates those economic development efforts chosen by community members and implemented by community-based development organizations (CBDOs). Such an approach can succeed. The National Congress for Community Economic Development, the trade association for CBDOs, notes that community organizations have already developed 71 million square feet of commercial and industrial space, lent \$1.9 billion to business enterprises, and created 247,000 full-time jobs mostly benefiting poor communities and their residents.^[6]

TYPES OF CBDOS

Community-based development organizations are organizations responsible to a neighborhood or constituency group of disadvantaged individuals, usually but not always incorporated as non-profits, whose stated mission is to economically improve neighborhoods of deprivation in ways that benefit current residents and individuals in need. A wide array of community-based development organizations undertake equity economic development work.

Many *neighborhood organizations* and *block associations* include economic development efforts as part of their ongoing community organizing efforts. These non-profit and volunteer organizations encourage city hall to provide infrastructure repairs or to increase services (e.g., garbage pickup, frequency of public transit) needed to retain existing businesses in the neighborhoods, join coalitions to advocate for neighborhood projects, and encourage the formation of specialized organizations that focus on economic development work. In several progressive cities, government have worked with neighborhood planning organizations to obtain citizen input into economic development efforts. In Minneapolis, for instance, neighborhood organizations are responsible for the local plans that city line agencies follow in their renewal efforts. In Boston, the Dudley Street Neighborhood Initiative has prepared for its own neighborhood and city redevelopment plan. In several dozen other locales, comprehensive community initiatives (CCIS) set up by foundation-city-neighborhood partnerships to coordinate social programs, housing efforts, and infrastructure renewal to improve the community environment in ways that will create jobs or attract businesses.^[7]

In contrast to neighborhood organizations, planning groups, CCIs, community development corporations (CDCs), and community development financial institutions (CDFIs) focus their entire efforts on economic development and housing projects. Community development corporations are community-based organizations that undertake capital-intensive, physical development projects, such as building affordable housing, setting up commercial properties, and

promoting industrial renewal. Although most of their work focuses on housing renewal, many CDCs also act as neighborhood economic developers. Community Development Corporations are structured as non-profits that can receive grant money, but are also chartered as quasicapitalistic organizations that can participate in commercial, housing, and industrial development work. Community development corporations can become stock holders, partners, or owners in for-profit ventures; acquire debt; and manage firms. In addition, CDCs act as a neighborhood business advocates, run training programs that help people to improve their job skills or learn how to set up a business. To complement their efforts in housing and economic development, CDCs collaborate with social service agencies to help individuals combat personal, family, or economic problems that limit their economic activities.^[6] Another cluster of community-based-organizations, CDFIs, focus their efforts on providing capital needed for economic renewal within poor neighborhoods. The array of CDFIs include community credit unions, community venture capital development funds, community development banks, and microenterprise funds that collectively act as financial intermediaries within poor neighborhoods.^[8]

PHILOSOPHIES OF COMMUNITY-BASED DEVELOPMENT

How do the efforts of community-based development organizations differ from those of conventional economic developers? To begin, the work of CBDOs is guided by a shared organic theory^[9] that promotes the idea that economic development is about empowering the poor, not merely about doing projects. Redevelopment projects initiated by CBDOs explicitly attempt to increase social equity in ways that benefit those most in need. Promoting dead end, unskilled jobs does not bring about social equity; neither do high-tech projects that displace the poor and gentrify the neighborhoods. Instead, in their efforts to make sure that the poor benefit from economic development efforts, a CBDO would set up a training program to prepare community members for the skilled positions offered by firms that are helped by the CBDOs. For instance, in Kansas City, a CBDO helped a telephone company to set up a back office facility in an inner-city neighborhood that employed community members who received the training necessary to upgrade their skills to the level needed by the company.

As a second component of the organic theory, CBDO-sponsored economic development projects are intended to increase capital flow within poor neighborhoods. When firms that expand in the neighborhood hire community members, wages earned are recycled

as employees purchase goods in locally owned stores. Community-based development organizations have helped to develop supermarkets in neighborhoods that lacked convenient and affordable shopping, insisting that the supermarkets both train and employ community members. Or, a CBDO might assist a local business that provides insulation to homes, enabling community members to save money on utility money, money that is exported from the community, and to spend it in neighborhood stores.

Third, economic development is not done in isolation but instead becomes part of broader, programs of holistic social repair. Efforts to improve schools or provide day care are incorporated within the broader economic development agenda. Without better schools, employees are not prepared for jobs; for single mothers to be able to leave home and work, day care is needed. Women are more likely to be victims of poverty than are men, so many CBDOs establish programs to aid female entrepreneurs obtain capital or learn how to convert a skills or talents into a microenterprise business. Because businesses fear crime; crime watch and antidrug programs become part of the CBDO's broader economic development agenda. The housing build by CDCs creates a stable residential environment for the poor, while luring back the working class. In turn, the residents of the new, affordable housing form a market that encourages commercial ventures to return to the neighborhood. In regional efforts, CBDOs join with environmentalists to promote smart-growth programs that restore inner-city communities, helping community residents and reducing urban sprawl.^[10]

TECHNIQUES OF COMMUNITY-BASED ECONOMIC RENEWAL

In guiding the economic renewal of poor neighborhoods, CBDOs follow five overlapping approaches that vary from directly sponsoring entrepreneurial, capitalistic projects to community-organizing efforts meant to pressure government not to abandon poor communities.

As entrepreneurial capitalistic investors, CBDOs themselves establish profit-making enterprises, usually those supplying goods or services lacking within poor communities. In undertaking such efforts, the CBDO will first obtain public or foundation support to pay for the social costs of remediation—acquiring and repairing an abandoned property, cleaning up a brownfield, removing abandoned vehicles. Then, with the land improvements accomplished, the CBDO will by itself or in partnership with conventional firms develop a commercial project on the restored site. For instance, the Kansas City CDC rehabilitates abandoned inner-city sites, one so derelict that it was

used as a set for a postatomic war movie, and then builds inner-city shopping malls often owned and managed by the CDC itself. In a disadvantaged Newark neighborhood, New Communities Corporation (in partnership with a grocery chain) built a full-service super market on a previously derelict lot; other CBDOs have started firms to process and recycle waste materials found in the older industrial neighborhoods into usable products. People in poor communities are consumers of social and medical services for which they often have to leave the neighborhood to receive. Community-based development organizations, such as Bethel in Chicago, will set up social service agencies—medical clinics, for instance, that provide needed services within the community while also training community members to work in these agencies. As social service providers, such CBDOs themselves become a major community employer. As quasicapitalists investor, CDFIs endeavor to expand the capital available in poor communities, setting up development banks that directly invest in neighborhood projects or forming community development credit unions that allow community members both to deposit their earnings and to receive loans.

With catalytic economic development projects, CBDOs encourage government to provide the incentives that enable for-profit firms to expand their efforts within neighborhoods of need. For instance, as neighborhood shopping strips disappeared, poor communities found themselves devoid of economic centers that provided needed goods and services and symbolized economic vitality. Acting as chambers of commerce, CBDOs form business investment districts that obtain public resources to restore such shopping strips. Community-based development organizations have initiated transportation-oriented development projects (TODs) in which government is pressured to improve a transit node and, in doing so, rebuild in ways that encourage stores to locate near this high traffic generator. By setting up industrial or commercial incubators, CBDOs catalyze economic renewal. In incubator projects, a CBDO obtains a subsidy to convert an older building, often an abandoned industrial plant, into affordable space for start-up firms, both from the neighborhood itself and those that will employ community members. At times, funds are even available to hire a successful business person to act as a mentor for start-up companies. In other catalytic efforts, CBDOs help to form worker cooperatives in which individuals learn skills, market products, and collectively own their firms. In Alaska, for instance, indigenous people have set up a Musk Ox Cooperative to process and sell the exotic wool of that Arctic animal.^[11] Community development financial institutions provide loans (that mainstream financial institutions refuse to make available) to

conventional entrepreneurs willing to invest in neighborhoods of need, while revolving loan funds are established to provide the small amount of seed capital required to set up microenterprises. Community-based development organizations will teach neighborhood capitalists how to prepare business plans and pro formas that can then be used in obtaining investment capital, while introducing them to loan officers at banks.

Most CBDOs recognize that to repair the economic damage in poor communities, efforts are needed to expand social and human capital. Poor people often lack both training and capital to start a business or to obtain the specialized education needed for better employment. To encourage this expansion in human capital, CBDOs link training and education efforts to individual development account programs (IDAs). While community members further their education or undertake apprenticeship training, money is put aside for them in an escrowed account. On completion of the training, people receive the lump sums to be used as investment capital either in a business or in further education. Individuals from poor communities lose wealth by being victimized by exploitative predatory lenders. Community development financial institutions establish financial literacy programs, teaching people how to negotiate the increasingly complicated financial system and to avoid losing their limited capital to unscrupulous lenders.

Community-based development organizations expand social capital by linking people to each other. Appalachian Center for Economic Networks (ACENET) in Appalachian Ohio set up flexible manufacturing networks that linked small manufacturers, designers, and marketers to promote products, while Esperanza Unida in Milwaukee brought together older experienced community members to train unemployed youth as mechanics. In Chicago, the Jane Addams Resources Corporation responds to requests by neighborhood companies to help workers the companies already employ to update the skills needed to enable the companies to survive in a changing economy.^[12] After the major change in the mid-1990s in welfare laws, CBDOs expanded their efforts to provide training and job access to the welfare poor. For instance, in Texas, Project Quest run by a CBDO provides potential employees with the specific training requested by firms, virtually guaranteeing future work.^[13] Social service agencies can expand needed social capital. For instance, day care, especially services that are open during the irregular shifts that the poor are forced to work, create jobs within the community for those who provide the service, while allowing others to take jobs away from home. Increased neighborhood pride also expands social capital. Several CBDOs have initiated projects that celebrate a community's culture,

such as the Jazz Museum and Black Baseball Museum established by a CBDO in Kansas City.

As advocates for neighborhood economic development, CBDOs provide an assertive voice that speaks for the economic needs of poor communities. Community-based development organizations set up “early warning systems” to shout out to the public sector when established businesses threaten to leave inner-city neighborhoods, often because of the lack of city services. Community-based development organizations join with local labor alliances, such as in the Calumet Project in Indiana, to pressure companies not to abandon poor neighborhoods.^[11] Community-based organizations such as BREAD in Columbus, Ohio, pressure city officials to set up transit centers that enable those from the inner city to commute to suburban jobs.^[10]

Working in citywide coalitions, CBDOs advocate for first-source hiring programs that mandate that companies that receive public subsidies must hire community members, often people trained by the CBDO. In living wage campaigns, CBDOs join with other community activists to insist that no public dollars be provided to firms unless the companies pay wages that at least match the family poverty level. Advocacy coalitions such as Chicago’s Neighborhood Capital Budget Group have brought together CBDOs and neighborhood activist organizations to campaign to ensure that neighborhoods, not just downtown, receive funds for infra-structure repairs.

GOVERNMENT POLICIES IN SUPPORT OF CBDOs

How can public policies and the actions of public officials be redirected to help the community-based development in this movement? To begin, public officials must recognize that heavily subsidized, grandiose, downtown projects do little to help the poor. Instead, they must accept that economic development is about creating social redress and that CBDOs play a crucial part in bringing about economic equity.

Public subsidies to establish economic development trust funds can help to pay for the seed money for projects in poor communities, as does capital to set up revolving loan funds. In poor communities, land ends up in public ownership because of tax forfeitures. The public sector can donate this land to CBDOs for economic development work, but before doing so paying for the remediation that many of these brownfields require. In places such as in the Dudley neighborhood in Boston^[12] or in Chicago during the progressive Mayor Washington administration, government delegated authority to community groups for planning, land use, and zoning, and seed money for start-up

firms,^[14] enabling communities to better control their own development. Local government salaries must recognize that CBDOs rarely make sufficient profit to pay for their core operating expenses (e.g., salaries of ongoing employees, office space) and should use community development block grant, or tax increment financing funds, to provide a substantial proportion of the core operating expense of CBDOs.

National policies, too, could be introduced or enhanced to help the community economic development movement. The Office of Community Services in the Department of Health and Human Services administers a small grant program that provides capital investments to neighborhood economic development projects that have leveraged a significant private sector investments. This program must be continued and expanded. Public funding helps to pay the administrative costs of CDFIs, and enables these financial intermediaries to work on the smaller, overhead-intensive, investment projects needed to stimulate neighborhood business growth. Federal programs such as the New Markets Tax Credit that provide tax credits that encourage both for-profits and CBDO-for-profit partnerships to invest in poor communities need to be expanded. Most important, federal regulators must enforce the Community Reinvestment Act (CRA) that mandates banks to reinvest in poor communities, both for housing and economic development projects. New federal regulations are needed that require the increasing array of non-bank financial institutions to provide capital to communities of need.

Recognizing that they need help, activists within the community redevelopment movement, working with foundations, have set up support organizations that provide technical assistance and political advocacy for community developers. These organizations include trade associations, technical assistance providers, financial intermediaries, training academies, specialized consultants, and accounting and legal firms that concentrate on community renewal programs, and increasingly include academic institutions that offer programs in community redevelopment. Expanded public funding of these support organizations would dramatically increase the knowledge available on community economic development.

Economic Development, Financing

William L. Waugh Jr.

*Department of Public Administration and Urban Studies, Georgia State University,
Atlanta, Georgia, U.S.A.*

INTRODUCTION

Economic development is a policy priority for most local, regional, and central governments. Economic development is a means to reduce unemployment, increase tax bases, leverage other resources from the community, and curry public favor and support. When economic development slows, stagnates, or declines, it has an adverse effect on the community and political and economic leaders are held responsible. Therefore, the competition for new and expanding businesses can be intense and economic development programs may include a broad range of incentives to lure firms from other communities and to cultivate new firms locally. Financing economic development is a crucial concern and one that raises fundamental issues concerning who should pay for government programs, and how much should and can be invested.

DIRECT AND INDIRECT FINANCING

The financing of economic development programs may be direct in terms of investments of public monies in specific firms or sites, or indirect in terms of encouraging private sector investment. To some extent, there is an expectation that economic development will be guided and funded by those who reap the most direct benefit, private firms and individuals. However, governments guide choices and invest public resources to ensure that economic development serves the best interests of the community. In fact, many governments have pursued development with little consideration given to the social and economic impact on their communities, but such unfocused approaches are much less common today. To increase the likelihood of appropriate or desired kinds of development, communities typically offer incentives to locate, relocate, or expand in their communities. Incentive programs may include economic or financial incentives, along with other kinds of incentives. Financial incentives provide direct or indirect support. For example, governments may invest public monies in specific businesses as low-interest loans, or they may invest monies in training and infrastructure thereby permitting firms to use their money for other purposes.

The unavailability of adequate financing has been a major impediment to economic development in many jurisdictions. As a private sector issue, financing has largely focused on the cultivation of venture capital when traditional financing (i.e., bank loans) is unavailable. As a public sector issue, the financing of economic development has been through direct and indirect means. Governments have invested public monies directly in economic development efforts (e.g., providing loans to new and expanding businesses and providing access to pools of money such as public pension funds). They have also invested indirectly—offering tax abatements to reduce the financial burden of property and other taxes; issuing bonds to finance infrastructure and facilities; providing grants usually for specific purposes, such as training; assisting with debt financing, such as providing loan guarantees to help reduce interest rates; and offering more direct financial assistance in exchange for royalty payments.^[1]

Revolving Loan Funds

One of the most direct means of financing economic development with public money is to create a revolving loan fund. Loans are made available for start-ups, expansions, and other needs. As loans are repaid, the money is returned to the fund and made available for new businesses.

Loan Guarantee Programs

Rather than making money available through a public loan program, governments can provide guarantees to banks and other financial institutions that loans made to businesses locating in an industrial park or enterprise zone will be repaid even if the firm fails. Loan guarantee programs are useful when traditional lenders consider the risk of business failure too high for them.

TAX INCENTIVES

Tax incentives have been one of the more popular means of encouraging economic development, and

they are widely assumed to have a significant impact on the site selection and/or expansion decisions of businesses. The popularity of tax incentives has characterized local and state development programs for several decades, despite the number of studies that demonstrate their marginal impact. Tax incentives generally take three forms: 1) broad-based incentives; 2) targeted incentives; and 3) selectively applied incentives. The broad-based incentives are offered to any and all businesses that choose sites within a jurisdiction, make particular investments, or provide jobs of a particular kind or number. The government offers tax credits, exemptions, and/or deductions in exchange for investment, new jobs, research and development, and/or depreciation of equipment and/or other assets. Targeted incentives are offered for specific kinds of firms, such as firms choosing to locate in areas of high unemployment or in free enterprise zones or so-called high-tech or manufacturing firms. Communities may attempt to lure “clean” industries, such as movie making, hospitality or tourism, research, and education.^[2-4]

Property Tax Abatements

For local governments, in particular, property tax abatements can provide substantial financial relief for new businesses. Local governments generally do not have the financial wherewithal to create revolving funds and to make large investments in infrastructure and human resources, but they do have authority to levy property taxes. Reducing or eliminating property taxes for a period of time, sometimes for 10 or more years, can be a significant incentive for new businesses.^[5] State laws may also permit exemptions from inventory taxes through the establishment of “free ports.”

Also, economic development authorities, such as community development corporations, can purchase sites and build facilities and lease them to firms without the firms being liable for property taxes. They can also assist in securing loans for start-up and other needs, provide technical assistance, and act as an intermediary in dealing the regulatory agencies.

Tax Increment Financing

Tax increment financing has been a popular means of funding economic development because it is essentially a product of that development. Additional property taxes that result from the development in an enterprise zone or development district are paid to the general-purpose (town or city or county) government or special-purpose (school district) government and placed into a fund to finance improvements to the zone or district.^[6,7]

Industrial Revenue Bonds

The broadly focused approach has been characterized by the use of incentives, such as industrial revenue bonds, subsidies for compliance with pollution control regulations, property tax abatements, loan guarantees, accelerated depreciation of business assets, and corporate income tax exemptions.^[8]

Free Enterprise Zones

In the 1980s, “free enterprise zones” were the fashion and many still exist in the United States. “Free enterprise zone” programs are characterized by the designation of an area for development and the provision of various incentives for businesses locating within the zone. Property tax abatements, public investments in infrastructure improvements and job training, increased police protection, loan guarantees, tax credits for hiring residents of the zone, and other benefits are offered to lure businesses to the zone and to reward those that remain.

INDIRECT PUBLIC INVESTMENT

Infrastructure Improvements

To some extent, public investment in infrastructure, including the creation of industrial and research parks, provide indirect financing for economic development. The investments can reduce start-up and operating costs to business and can facilitate growth.

Technical Assistance Programs

Programs to provide technical assistance with marketing, export regulations, and other crucial capacities, and management training to improve internal operations, may also be considered indirect financing. Such programs increase the likelihood of success and, thereby, increase the likelihood of funding by banks and other venture capital sources.

Land Banks

Some cities have created land banks to assist firms in acquiring properties for development. Abandoned, tax delinquent, donated, and transferred properties are put into the land bank. The bank assures that the titles are clarified, waives tax liability, and sells the property to developers. The land bank can be used to put together parcels for large development projects, such as manufacturing plants and condominium complexes.

The bank can reduce the cost of property to developers and facilitate the process of land acquisition by assuring that large parcels can be acquired without having to deal with many different property owners.^[9]

LEVERAGING PRIVATE FINANCING

Perhaps the most obvious and less risky approach to economic development is through leveraging private investment. Economic development can be financed through the encouragement of traditional bank financing and through foundation grants. Community commitment to development can increase the likelihood of success among participating firms. Banks and foundations may judge that the community commitment will increase the likelihood of success. Similarly, government officials and private entrepreneurs can cultivate venture capital from private investors.

Community Improvement Districts

Private investment is also encouraged through the creation of community improvement districts. Development within the districts is facilitated by public-private arrangements and funded directly by a system of self-taxation. Public investment is generally in the form of enhanced public services, including public safety, and infrastructure improvements.^[10]

CONCLUSION

The trend is toward broad incentive packages that are responsive to the needs of both the community and the participating firms. In the state of Georgia, for example, the state offers job tax credits, investment tax credits, retraining tax credits, child care tax credits, sales tax exemptions, and freeport (property) tax exemptions.^[11] The stakes are high in economic development efforts. There is much risk in direct investments of public money because of the high failure rate of new firms and at least some risk in indirect investments in such things as infrastructure improvements that may be firm- or industry-specific because firms may choose to leave for reasons beyond the control of the local government. In short, communities may be left with millions of dollars in bond debt for improvements that the next firm may not find useful or desirable. To address that problem, Ledebur and Woodward suggested that governments evaluate development incentives carefully and assure that they are cost effective. When firms do not live up to their responsibilities, governments should be

prepared to reduce or eliminate public subsidies for non-performance.^[12]

The trend has also been toward more creative forms of financing to overcome constitutional and statutory limits on taxing, spending, and borrowing (debt) authority. Local governments have few sources of revenue and limited political autonomy, except in some larger cities and counties. State governments, too, have limits on how they can raise and spend revenues. The use of general obligation bonds may be severely limited and there is tremendous political opposition to new taxes regardless of their purpose. These are the constraints within which economic development authorities operate.^[13]

INTRODUCTION

Immigration for decades has interested economists, sociologists, and historians, at least in part because America is a nation of immigrants. Only recently has immigration attracted much attention from economic development researchers, policy makers, and practitioners. Even though immigration is a huge economic policy issue in America, little solid empirical evidence exists to inform debate, and the information that does exist tends to be contradictory. Yet there is enough information available to cobble together insights around the following questions:

- Immigrants arrive in the United States from around the world: which groups are likely to become entrepreneurial and why?
- Immigrants affect local economies in various ways—good and bad: what are these effects, and why do they occur?
- What are the policy implications facing local economic development decision makers?

We focus mostly on self-employment among immigrant groups because this is central to economic development. We do not address the importance of immigrants to the labor force—immigrants are critical in filling jobs in lesser skilled and, in some cases, higher skilled occupations—because this is another policy domain, better addressed elsewhere. Before discussing these questions, we provide an overview of trends in immigration.

IMMIGRATION TO AMERICA

Commentators have christened the decade of the 1990s as the *Second Great Migration*, the first occurring at the turn of the twentieth century.^[1] In the past decade, about 9 million legal immigrants arrived, a number

unprecedented since the early 1900s when 8.8 million migrants came to America. In fiscal year 2000 alone, the Immigration and Naturalization Service (INS) legally admitted 849,807 immigrants into the United States. The number of foreign born, according to the 2000 Census, is now 31,107,889, or 11.1% of the population. If children of immigrants born in the United States are included, the immigrant population becomes 20.4%. Immigrants account for 37% of U.S. population growth, 50% if calculations include their American-born children.

States receiving most immigrants in 2000 were California (217,753), New York (106,061), Florida (98,391), Texas (63,840), New Jersey (40,013), Illinois (36,180), and Massachusetts (23,483). Immigrant groups tend to migrate to places having large populations from similar cultures. Chinese cluster in California and New York; Cubans and Haitians in Miami; Indians, Filipinos, and Salvadorians in California; and Mexicans in California, Texas, Arizona, and Florida. U.S. Census data show that 95% of immigrants live in urban areas, and that 65% live in just 10 cities, probably because immigrants receive a better reception in cities, can access more services, and have better opportunities.

Immigrants come from all over the world, but some countries contribute a much greater share. In 2000, Mexico (173,919), China (45,652), Philippines (42,474), India (42,046), Vietnam (26,747), Nicaragua (24,029), El Salvador (22,578), and Cuba (20,831) were major contributors. This represents a substantial shift away from European and Canadian origins, where economies are in good shape, toward Latin American and Asian countries, where prosperity is limited.

Of those admitted to the United States in 2000, few (189,357) reported having an occupation. But 94% of working-age immigrants were in the labor force, as compared with 91% of natives. Some 28%, or 237,841 immigrants, were 19 years of age or younger, making them on average much younger than the native population. One-half (54.4%) of all immigrants were married. About one-third arrived with less than a

high school education, but 29% had a college degree. Those with no occupation, no family, and little education will have difficulty becoming self-employed.

Anywhere from 7.1 to 8.5 million immigrants are illegal aliens. Two-fifths entered the United States legally, lost their legal status, and remained here as illegals. About one-half of illegals are Mexicans. Illegal aliens will find it much more difficult to find work, let alone successful self-employment.

WHO BECOMES SELF-EMPLOYED?

Self-Employment Theory

From an economic development perspective, one would want to know why some groups become productive members of communities through self-employment, whereas others arriving in the United States do not. There are three widely invoked models to explain immigrant new business formation—*middlemen minority*,^[2] *ethnic enclave*,^[3] and *reactive cultural*^[4] theory—all of which focus on *supply-side*, meaning those who produce goods and services, and, comparisons of intergroup differences.^[4]

Middlemen minority theory holds that some immigrants enter majority society only for commercial reasons where they serve as middlemen between well-off producers with goods to sell and poorer consumers desiring to buy them. They remain isolated or detached from majority society because they eventually intend to return home. Korean grocers in Los Angeles, for example, are middlemen between white producers and distributors of produce and poor African Americans in distressed neighborhoods. Ethnic enclave theory asserts that successful immigrant entrepreneurs tend to locate in clearly bounded geographic areas where their culture, language, networks, access to labor and capital, and vertically and horizontally integrated markets give them a comparative economic advantage over those in the larger economy. Cubans, once densely concentrated in Miami's "Little Havana," served as a model of this characterization. Reactive cultural theory (and its predecessor, cultural theory) emphasizes trust, solidarity, and mutuality among immigrant groups who pool capital for investment in small businesses, and coordinate social and economic activities. Japanese immigrants to America in the years prior to World War II used ethnic solidarity and ethnic resources to establish and manage small businesses.^[5]

Although these theories persist in professional and popular literature, they have been roundly criticized, and even debunked (e.g., Refs.^[5]). Middlemen theory overlooks the fact that many immigrants do not intend to return home. Ethnic enclaves cannot explain how immigrants initially started businesses, seemingly only

explaining what happened much later in the business formation process when resources had already become available. In addition, researchers have found few, if any, ethnic enclaves, because economies are much more diverse, less spatially isolated, and less integrated than this narrow model suggests. Cultural theory overemphasizes cultural solidarity, failing to take into account class differences among immigrants. Upper-class immigrants have access to scarce resources, especially capital, not available to everyone in that culture. Cuban refugees fleeing Castro's regime in 1959–1960 were well off, whereas Mariel Boatlift refugees, composed of many criminals and institutionalized populations, of the 1980s were much less prosperous. The former groups took over Miami's economy; the latter were left out.

The most convincing explanation for successful entrepreneurship is that immigrants to the United States, or anywhere else for that matter, must possess the capacity either to create wealth themselves (or to obtain work that allows them to be independent or to eventually become so), and they must locate at or migrate to a place that provides economic opportunities. Successful immigrants are those whose capacity matches opportunity—*interactionism* theory.^[4,6] Taiwanese, having math, computer, and engineering skills, came to America to participate in the "dot.com" revolution.

Other theories try to explain why immigrants become self-employed. The two leading contenders have yet to gather convincing empirical support, although both persist in the literature.^[7] One is the *blocked mobility* theory—that immigrants facing discrimination or barriers in labor markets are forced into self-employment as the only alternative to unemployment or welfare. Discrimination takes many forms—racial, linguistic, cultural, and religious. But this cannot explain why larger numbers (9 in 10) succeed as workers, and why some immigrants facing barriers never break out. The other is the *predisposition* theory—that some groups are predisposed to self-employment because they were highly entrepreneurial in their home countries and desire to continue the tradition. But this theory cannot account for such phenomenon as the success of recent Eastern European and Russian immigrants who had no business start-up experience.

Ethnic Businesses

A study by Razin and Light^[4] shed light on ethnic self-employment in 16 of the largest metropolitan areas. The rate of self-employment was highest in Sunbelt and western metropolitan regions characterized by economic and cultural diversity: Miami, Los Angeles, San Francisco, San Diego, and Seattle. Lowest rates were in declining manufacturing regions: Detroit,

Cleveland, Chicago, and Philadelphia, and in the nation's capital, Washington, DC. Immigrant self-employed, as a percentage of the immigrant population, are prevalent in central cities, 10.3%; suburbs, 12.5%; and nonmetro areas, 7.9%.

The higher the rate of self-employment among immigrants, the higher the rate of self-employment overall in the labor force; that is, entrepreneurial places breed entrepreneurial behavior across a wide spectrum. Similarly, the higher the level of immigrant self-employment, the higher the level of income within immigrant groups.

Greeks and Koreans were consistently self-employed in cities across the country. Other "conspicuously" self-employed groups include Middle Eastern and North Africans, among them Iranians and Israelis. Dutch, Hungarian, Czech, and Polish self-employed are dispersed nationwide. Some immigrant groups dominate selected cities. Cubans monopolize Miami, probably more than any other immigrant group controls an American city.

The least entrepreneurial seem to be people from the Caribbean and Philippines. Mexican and Puerto Rican immigrants have lower levels of self-employment, but some argue that they are undercounted because they work in the underground economy as street vendors, handy men, gardeners, babysitters, and the like.^[8] But many analysts would reject these activities as they do not really represent self-employment, but causal, part-time labor.

Capacity for Self-Employment

Factors affecting self-employment capacity are generally well-known and apply to immigrant populations. Immigrants having business experience, appropriate skills or education, access to networks (e.g., professional, family, or groups) able to provide support, values or cultural attributes contributing to wealth creation, and access to capital tend to have a greater propensity for successful self-employment.

English

The ability to speak English and its relationship to self-employment has not been studied. Findings for the labor force may generalize to the self-employed, but they are mixed; some finding English language to be a major factor, others not so. Generally, those who speak English improve their earnings over non-English speakers, while those in jobs not requiring English or those living in areas not dominated by English speakers are somewhat less affected.^[9] It is likely that speaking a language that fits requirements of the market is an important factor and that being bilingual cannot

hurt business prospects. Generally, as time passes, immigrants master some English and their children tend to have much less difficulty. There is, of course, a continuing debate in this country about how and when to immerse immigrant children in an English-only curriculum.

Education

Education is the foundation for success in most societies.^[9] Those with an American education or its equivalent tend to do better than those not so fortunate, at least in the American market. For example, it is no accident that a high proportion of Indians immigrating to the United States are physicians or have PhDs; their skills are in demand.

Family ties

For immigrants, family is a major factor in the success of small- or microbusiness development. Family-owned businesses with no paid employees account for more than three-fourths of all immigrant enterprises.^[10]

The family can be viewed as a network of obligations that embodies the social, economic and cultural investments made prior to immigration, and that immigrants draw on and continue to invest in during the process of adaptation. The family endows each of its members with the backing of collectively-owned capital, a credential that entitles members to credit Thus, the family comprises a social network that can be effectively harnessed to achieve collective goals.

It is also the case that married people are much more likely to operate businesses than single people. But as immigrant businesses continue to develop or advance, family resources (e.g., financial, information, and counsel) tend to decline precipitously over time.^[5]

Social capital

After the family, ties with the broader ethnic community become important. These networks, referred to as *social capital*, are sources of business information, including markets, supplies, and opportunity. These networks, often discussed in the context of enclaves, are powerful resources. Networks, for example, so dominate business relationships that they even affect *intracommunal transfers* of businesses. One study in Los Angeles found that Koreans tended to sell their businesses to Koreans, and Hispanics to Hispanics, even though other native buyers were available.

Start-up capital

Obtaining start-up capital is an issue for most businesses.^[11] Immigrants largely obtain start-up or

expansion capital from friends, relatives, or acquaintances. Capital obtained is generally in small amounts. Once businesses begin to grow, immigrants seek funding from formal sources (e.g., banks, investors), often their countrymen. Capital may originate overseas or locally. In a study of Taiwanese entrepreneurs, 57% reported obtaining start-up capital from their homelands.^[12] In a study of Korean entrepreneurs, researchers found that Korean suppliers extended credit terms, lower prices, and easy access to information.^[5] Successive waves of Cubans fleeing Castro's government were offered *character loans*—no collateral required—by wealthy Cuban immigrant bankers who were willing to invest in refugees.^[13] Indian entrepreneurs in high-tech centers (e.g., Silicon Valley in California, Route 128 in Boston) are highly organized into self-employed networks that can raise millions for new business startups.^[11]

Market Opportunity

To be successful, ethnic entrepreneurs must be able to take advantage of market opportunities—*demand-side* factors. This translates into concentrated economic activity, economic linkages, and globalization.

Economic sector

Ethnic self-employed, regardless of where they originate from, are likely to start restaurants or drinking places. These places serve fellow immigrants and natives with a penchant for “foreign” cuisine. Also, construction companies are popular in most areas. Many worked construction in their home country or acquired skills as laborers, often unskilled, in this country. Many are nonunion shops, making them less costly and more competitive. But some immigrant groups specialize, often quite successfully. Taiwanese and Indians dominate, given their relatively small numbers, the high-tech, info-tech, hardware and software, and communications industries, nationally and internationally (see sections below). These cultures produce people with math, computer, and engineering skills. They come to the United States, receive even more specialized education, then start up or work for high-tech firms.

Linkages

Just as some immigrants exploit networks to enhance their capacity domestically, *transnational networks* or *communities*—cross-border business relationships—have opened up markets considerably over the past few decades.^[14] Saxenian studied immigrant entrepreneurs in California's high-tech region, Silicon Valley. She found that one-half of Chinese and Indian immigrants set up subsidiaries, joint ventures, subcontracts,

and/or other business operations in their home country. Half of those starting new businesses did so with two or more cofounders from their home countries. So prevalent are Chinese entrepreneurs in Monterey Park, California, who travel incessantly on business that they have been dubbed “astronauts.” Similarly, Chinese immigrants in Queens are widely known to have raised capital for businesses from contacts in Hong Kong and Taiwan.

Globalization

Globalization's effects on local economic development and immigration are only just now beginning to be understood.^[15] One factor facilitating international migration is the *liberalization*—removing barriers—of trade. Labor is free to move in search of job opportunities as economies open up. In advanced economies, governments have an interest in opening up their markets to imports from less advanced economies. This allows poorer countries to create wealth through exports that in turn allows them to accept imports and keeps workers at home, gainfully employed. The North American Free Trade Agreement (NAFTA) of 1993 between Mexico, Canada, and the United States was an attempt to remove most trade barriers and in the process stem the tide of immigration.

WHAT ARE THE IMPACTS?

Local policy makers want to know how immigrant economic activity affects economic development and how social factors affect economies. In spite of the increasing prevalence of immigrant populations in America, both positive and negative consequences of immigrant economic activity are little supported by solid research, greatly misunderstood or misrepresented, and highly controversial.

Economic Development Impacts

Immigrant entrepreneurs create jobs, build wealth (both private and public), pay taxes, build communities and local economies, and help needy relatives back home. But some also displace native-born Americans; exploit workers from their own culture; participate in the hidden, illegal, or underground economy; and engage in criminal behavior and corruption, in the process retarding community building. It is important not to stereotype people. No group is entirely positive or negative, and we suspect that most people contribute positively whether they are immigrants or natives. It is also important not to exaggerate contributions, either positive or negative.

Growth

At the macro level, recent immigrants increased the value of U.S. gross domestic product (GDP) from \$6 billion to \$20 billion, depending on the study.

Even though relatively modest as a proportion of a multitrillion dollar economy, the amount that immigrants have contributed to economic growth is a matter of controversy in the literature, in part having to do with who should be considered an immigrant? Many studies consider foreign-born people living in the United States to be immigrants, but their American-born children to be natives. Other studies include, or at least do not explicitly exclude, second and even third generations of immigrant parents in the growth calculation, arguing that subsequent generations would not have been entrepreneurial but for their parents.

In 1997, using narrow definitions, self-employment was equally prevalent among natives, 11.8%, and recent immigrants, 11.3%. Immigrants are neither more nor less likely to be self-employed than natives. Using somewhat broader definitions, according to the U.S. Small Business Administration (SBA), between 1988 and 1998 numbers of self-employed Asians rose by 56.5%, Hispanics by 30.1%, and Whites by 1.1%. Whites account for 90.4% of self-employed people. The growth in self-employment of 3.9% nationwide, then, is based on immigrant, as broadly defined, small-business activity.

Data, over time and across generations, show that immigrants contribute significantly to the economy. The SBA estimates that in 1997, Asian self-employed people generated \$275 billion in revenues and employed 1,917,244 workers, whereas Hispanics produced \$184 billion and employed 1,492,773 workers. Like most small businesses, the lion's share, 87%, of immigrant businesses employ 10 workers or less. Some immigrant groups contribute economically despite their small numbers. In a study of Silicon Valley high-tech firms, Saxenian^[14] found that 24% had either Chinese or Indian executives. About 2000 firms were managed by Chinese entrepreneurs and another 774 firms by Indians. These companies had \$16.8 billion in sales and employed 58,000 workers. Companies averaged between \$200,000 and \$300,000 in sales per employee.

In spite of their contributions to economies, immigrant economic activity has been criticized by some observers.

Remittances

Remittances are transfer payments made by immigrants living in the United States to relatives living in their country of origin. Some critics worry over money being sent overseas. A report on President Bush's visit to Miami in May 2002 by National Public Radio

estimated that Cuban exiles in South Florida send about \$500 million to Cuba annually. Castro's government receives more money from remittances than from exports of sugar and nickel, and net payments for tourism. The Inter-American Development Bank estimates that immigrants will send about \$300 billion home over the next 10 years. The World Bank estimates that Latin America and the Caribbean receive about \$15 billion in remittances annually.

According to the World Bank, immigrants earning less than \$20,000 annually send as much as \$3000 home each year. Remittances slow economic progress for those compelled to send money home. But the longer immigrants remain in the United States, the less likely they are to continue sending money home.

Some consider the decline in U.S. foreign aid to developing countries in recent years to be more than compensated for by remittance transfer payments. Ironically, according to studies by the World Bank, remittances do not reach very poor people; those better off tend to receive transfer payments. As a consequence, remittances and foreign aid may not be a comparable trade-off.

Self-employment activity in transnational communities yields important economic development benefits for developing countries that may in turn benefit America. Residents of Ticuani, Mexico, for example, needed a new town water system, a facility their local government could not provide.^[16] Residents petitioned relatives in Brooklyn who in turn formed a committee, referred to as a *home town association*, to raise funding, referred to as a *community remittance*, for the water plant. Provision of the new water plant only occurred because of the continued linkage between Mexican-American entrepreneurs and villagers. Potential positive benefits of transfer payments are that future business development ties may be forged, but such linkages have not been studied.

NAFTA

Critics of NAFTA argue that immigration has not abated and that jobs have been lost in America. Although accurate figures are unavailable, as many as 1 million U.S. jobs, actual and potential, may have been eliminated to NAFTA since the 1990s.^[15] Job loss went relatively unnoticed because of the unprecedented growth in the American economy over the decade. Nonetheless, some communities and states felt NAFTA job loss much more than other.

Intergroup competition

Self-employment activity by immigrants might take away opportunities for natives, African Americans being most at risk because they may compete directly with immigrants in some communities. Immigrants working

together to erect barriers prevent natives from firmly competing. Fairley and Meyer,^[17] in a study of 132 largest metro areas, found that immigrant self-employed appear to displace natives, keeping them from starting new businesses. They found that immigrant self-employed did not displace African Americans overall. But a study by the National Academy of Sciences found some displacement for African Americans living in areas with high concentrations of immigrants. Presence of immigrant self-employed did not affect earnings of natives.

Immigrants might displace or impede self-employment for other immigrants. Having a common language, for example, does not guarantee that economic benefits will accrue. In Miami, although Spanish-speaking Cubans dominate, Spanish-speaking Mexicans and other Latinos have been excluded from the larger Cuban economy for cultural reasons.^[18]

Low wages

Since the 1990s, immigrant earnings have steadily declined relative to natives, with natives earning one-third more than immigrants. This is largely because recently arrived immigrants are unskilled and poorly educated compared with their predecessors. Being unskilled, they are forced to work for less. This depresses the wages of native unskilled labor that must compete with immigrants willing to work for less, but drives up wages for skilled workers who become scarcer. It takes about 16 to 20 years for an immigrant to reach wage parity with a native, after controlling on education and English fluency.^[1]

Studies are mixed as to whether immigrant self-employed exploit fellow immigrants by paying them low wages. Some argue that immigrants take advantage of recent arrivals because they lack education, language skills, experience, and capital to either make it on their own or to work for higher wages. Where immigrant populations are concentrated, workers become vulnerable to exploitation. Others argue that immigrant workers eventually do as well as natives, and in many cases better (e.g., Taiwanese). In the worse case, highly concentrated areas act as incubators, helping to launch people into better jobs as they acquire skills, and in many cases into self-employment as they accumulate experience and capital. Likely there is some truth in both observations. But it is certain that migrant farm workers, illegal aliens, and unpaid family members may not always prosper in America.

Hidden economy

Many people believe that some immigrant groups are prone to illegal activity, either because they come from a culture that condones such behavior or because

they adopt this activity out of necessity. Immigrants, especially illegals, from poor countries may be forced into the *hidden* or *underground* economy just to get a start in America. Miami is awash with “handymen” from Latin America who operate home repair businesses, some quite large, all outside the view of the tax collector and business regulators. Many of these businesses produce low-quality work. When the supply of cheap labor dried up after the Mariel Boatlift, Cuban entrepreneurs in the garment industry “contracted” with Cuban immigrants to do “homework” for low wages, no benefits, and employment instability.^[13]

The hidden economy is large, but there are no good, reliable estimates. And, it is not possible to parcel out underground activity among natives, foreigners and immigrants. One study of the informal economy in Hialeah, Florida, a city with a high concentration of Cuban immigrants, estimated that there was a \$300 million off-the-books economy in operation.^[13]

Criminal Activity

Immigrant populations are “popularly” associated with crime and corruption.^[13] *Proposition 187* in California, for example, asserts that the people of California have suffered personal injury and damage caused by the criminal conduct of illegal aliens in the state. In 1999, cities spent about \$1.5 billion incarcerating illegal aliens for criminal activity. In Miami, many immigrant businesses are deeply tied to the illegal drug trade, either as fronts for money laundering or as investments by “drug lords” in legitimate businesses. Many consider Miami the drug capital of the world, taking in \$50 billion annually. Eventually, illegal drug money ends up in off-shore banks where it cannot be accounted for. In 1979, the Federal Reserve Bank in South Florida had a cash surplus of \$3.2 billion, an amount representing 77% of cash surplus nationally. Immigrants from former Soviet block countries have fallen easily into criminal activity. The Russian mafia is now prominent in the United States and indeed worldwide, where they exploit networks once dominated or created by the KGB.

Even though crime among immigrants may be perceived as prevalent, research shows that recent inflows of immigrants have had no effect on crime rates in cities where they are heavily concentrated.^[19] Youth born abroad were significantly less likely to be involved in crime than native youth.

Social Impacts

Immigrant economic activity also creates positive and negative social impacts in communities that in turn affect economics.

Ethnic contributions

No one would disagree with the proposition that immigrants have enriched American culture. Indeed, if there is an American culture, then it is an amalgamation of the contributions of disparate ethnic groups. This is a positive legacy, but there are possible negative consequences.

Ethnic conflict

Immigrant populations either dispersed across the country and assimilated, isolated themselves in enclave neighborhoods or communities, or took over communities once dominated by native-born Americans. Cubans in Miami and Taiwanese in Los Angeles are illustrative of the latter. Cuban refugees descended on Miami in 1959, after Castro took over Cuba in a Communist coup. This takeover was followed by the 1980s Mariel Boatlift. Now, in 2002, Cubans make up 30% of the population. Many Cubans chose not to assimilate, maintaining Spanish as the language of business and private life, preserving Cuban culture including preservation of the Santería religion, and remaining isolated in large enclaves.^[13] Taiwanese took over large portions of Los Angeles not by gradually moving from the central cities to better neighborhoods, then to the suburbs, but by leap frogging to the suburbs directly.^[12] Their wealth allowed them to bypass the usual migration patterns prevalent among other immigrant groups.

When immigrant populations take over communities, they tend to preserve their own culture sometimes at the expense of those already there. In Miami, Cuban cultural change fostered an *English First* movement whose goal was to quell the rise in Spanish speaking. When that and other counterattacks on Cuban culture failed, Anglos began moving north in large numbers. This in turn caused many Cubans to further eschew assimilation.

Taiwanese immigrants formed “Little Taipei” in Monterey Park, California. Because of their wealth, home and commercial property prices began to skyrocket. Taiwanese were criticized for speculating in land—“The Taiwan Syndrome”—they intend to sell later. This practice has so driven up land prices that high-tech workers cannot afford to live there, creating a labor shortage. Anglos also blame Taiwanese for unplanned development, traffic congestion, and loss of community. Anglo businesses have gradually fled, as have many of its original residents.

It should be noted that the history of the United States is one in which one immigrant group successfully displaces another, either from abroad or internally. In Miami, Jews were replaced by Cubans who are now being replaced by Central Americans. Who knows what group will emerge next?

Ghettos

More often than not, poor immigrants, especially illegals, are forced either into distressed neighborhoods where housing is inexpensive or into more prosperous neighborhoods where multiple families share single-family dwellings. “Little Haiti” in Miami is a poor neighborhood dominated by Haitians and Dominicans. By contrast, the City of Miami Beach, the playground of the idle rich, also houses poor families in single rooms who survive by pooling resources. When the City of Miami faced a fiscal crisis in 1996, officials set out to identify illegal residences and collect taxes.^[13] About 4500 illegal residences were found and \$2.1 million in property taxes collected. High concentrations of poor people make neighborhoods depressed until they acquire resources either to move on to better accommodations or to revitalize it themselves, a rarer occurrence. But poor neighborhoods are the price societies pay to have inexpensive labor who produce low-cost goods and services.

Costs and Benefits

The problem with cost-benefit studies of immigration is that they are “questimates” with dubious assumptions and scant data yielding conflicting conclusions. Both pro- and anti-immigration advocates cite the same “definitive” National Academy of Sciences (NAS) report as evidence in favor of their conclusions, for example. Overall, NAS estimated that immigrant contributed between \$1 billion and \$10 billion in benefits to society, while suggesting that they cost \$15 billion to \$20 billion to taxpayers. In another study by the National Research Council, in 1997, immigrants made tax payments in excess of \$80,000 over the cost of services received. When only the first-generation immigrants are taken into account, recent immigrants consume more in services than they pay. Those who are poorly educated and unskilled tended to consume \$13,000 more in services than they paid in taxes. About 22% of immigrant households are on welfare, as compared with 15% for natives. Another study looking at gross domestic product (GDP) found that it cost native workers about \$72 billion annually or 1% of GDP.^[20] The only certainty about costs and benefits is their uncertainty. We agree with the following conclusion:^[21] “There may be costs for native workers in America, yet the gains to immigrant workers far outweigh them.”

LOCAL POLICY ISSUES

For economic development professionals, like it or not, immigrant populations necessitate a greater role

in, or at least an awareness of, national and even international factors (e.g., NAFTA), that now affect local economies. Likewise, greater attention must be devoted to cultural issues, social services, housing, and the like that accompany immigration; areas that have not traditionally been the province of economic development.

Within this broad context, what are the policy implications of immigration, self-employment, and economic development? Economic development professionals basically face the same issues as they would if only natives were involved, but with some twists. Should self-employed people be left to fend for themselves, or should the public sector assist them through technical assistance, training, or lending? If the public sector assists them, should immigrant businesses be targeted, or should they compete for services directly with natives? If immigrants are targeted, should immigrants control the services they receive?

Other articles in this encyclopedia address options for and benefits of facilitating economic development, so they need not be reviewed here. The real issue is targeting. If immigrant businesses represent culturally separate economic activity, then assistance to them must likewise be customized. Training Spanish speakers in English, for example, may not be effective. The best way to customize assistance is to provide funding and resources to ethnic communities and then allow them to meet their own needs. But, self-determination should occur within a broader city- or regionwide economic development strategy, of which an ethnic community is a part.

Economic Development, Infrastructure and

Robert Krol

Department of Economics, California State University, Northridge, California, U.S.A.

INTRODUCTION

An economy's infrastructure provides valuable services to private firms and individuals. Infrastructure investment can influence the growth, level, and spatial distribution of economic activity. The bulk of the research since the 1990s has focused on the impact of public capital investment on productivity and overall economic development.

Initial studies suggested that public capital had a large impact on U.S. economic activity. More recent studies found only a modest overall impact on the economy. The low net return to public capital investment reflects diminishing marginal returns to infrastructure construction, the spatial reallocation of economic activity, higher tax rates needed to finance projects, and reductions in agglomeration economies.

This article is organized in the following manner. First, U.S. infrastructure trends are reviewed. What follows is a discussion of how infrastructure influences the economy. Key empirical studies that examine the impact of public capital on the economy are reviewed. Special attention is given to reasons why the estimated net impact in recent studies is so small. Finally, policies to improve the efficiency of infrastructure provision and its use are discussed.

PUBLIC INFRASTRUCTURE TRENDS

This section discusses the composition and trends in the public infrastructure stock of the United States. To get a sense of public infrastructure trends, [Fig. 1](#) provides plots of a quantity index for federal-state & local fixed assets (the public capital stock) from 1960 to 1999. The non-military public capital stock data used in this section includes equipment and software, structures, highways and streets, conservation and development, sewer systems, water supply, and other structures. The data comes from the U.S. Department of Commerce *Fixed Assets and Consumer Durable Goods in the United States*.

Both indices trend upward over this period. The slowdown in federal infrastructure investment occurred in the late 1960s. This coincided with the completion of the interstate highway system. State and local infrastructure accumulation has not slowed significantly over this period.

[Table 1](#) provides information on the composition of non-military government fixed assets for selected years between 1960 and 1999. The shares do not change radically over the period. For the federal government, the exception was equipment and software, which more than doubled over the period. This is no surprise, as the government significantly increased its use of computers, beginning in the late 1980s and continuing into the 1990s. There is a noticeable decline in the federal conservation component over the period. Structures and highway's shares remained fairly stable during this period. The composition of state and local fixed assets appears more stable than for the federal government. Once again, the clear exception is the equipment and software component of state and local infrastructure.

State and local governments own the vast majority of the public infrastructure stock. As shown in [Table 1](#), the federal government owned approximately 18% of total non-military government fixed assets in 1960. By 1999, the federal government's share had declined to roughly 13%.

INFRASTRUCTURE'S IMPACT ON ECONOMIC ACTIVITY

Public infrastructure is made up of public goods typically subject to economies of scale, such as roads, sewage treatment facilities, and water supply systems. Increases in infrastructure can have a significant impact on economic activity in various ways. The effects on output can be direct and indirect.^[1] In the case of a direct effect, the infrastructure provides intermediate services to the private sector. For example, a new or wider road can reduce congestion, reducing travel time. Local businesses can now make more deliveries with the same number of trucks and drivers, resulting in higher output. Investments by firms in additional trucks would have produced the same result—an increase in the number of deliveries the firm is capable of making.

The indirect output effect works through the impact of greater infrastructure on the marginal product of private inputs hired by firms. If a complementary relationship exists between public capital and private inputs, increases in public capital result in a higher marginal product of private inputs. The marginal

Fig. 1 Public infrastructure stock.

product of the private inputs rises because they have more public capital to work with in the production process. The higher marginal product of private inputs raises the firm's demand for those inputs. Continuing with the road example, the improved road system makes existing trucks and drivers more productive. As a result, the firm buys more trucks and hires additional drivers, causing the firm's output to rise.

The previous example illustrated a complementary relationship between public and private capital. Alternatively, higher public capital can substitute for private capital, reducing private inputs in production. For example, a city can decide to produce electricity itself, rather than have it produced privately. In this case, public capital crowds out private capital. It may even reduce economic activity if government is a less efficient provider.

New infrastructure can influence the spatial distribution of economic activity in a region.^[2] The building

of a new road can cause businesses to relocate to take advantage of lower transportation costs and greater customer flows. The new road raises the marginal product of private inputs near it, creating an incentive for the private inputs to relocate closer to the road. Economic activity increases near the new road, but declines in areas away from the road. In this case, the road provides only localized benefits to firms near the road. As a result of spatial reallocation of economic activity, net output increases little in the region as a whole.

AGGREGATE AND REGIONAL EMPIRICAL STUDIES

This section reviews empirical studies that have played an important role in shaping the literature on infrastructure investment (see Ref.^[3] for more details). Much of the research in this area was stimulated by a controversial 1989 study by David Aschauer.^[4] Aschauer estimated an aggregate production function for the United States using annual data for the period from 1949 to 1985. He found public capital to have a large positive impact on total factor productivity and the productivity of private capital. In addition, he showed that the slowdown in the accumulation of public capital during the 1970s contributed significantly to the overall decline in U.S. productivity growth during the 1970s and 1980s.

John Tatom^[5] questioned Aschauer's results on three counts. First, Aschauer ignored significant time trends in the data; this could lead to a spurious finding of a relationship between public capital and

Table 1 Composition of infrastructure stock

Federal/total	0.183	0.161	0.146	0.138	0.13

productivity when none is present. Second, Aschauer ignored significant energy price changes that might have affected productivity during the sample period. Tatom found that including energy prices in the model and adding time trends reduced the measured impact of public capital on productivity by one-half. Tatom also provided evidence that some of the variables in the model are not stationary. Because of this, the model should be estimated in first differences. When Tatom estimated the model in first differences, public capital is no longer significant.

John Fernald^[6] reexamined the link between public capital and productivity. Fernald used a growth accounting approach to assess the impact of the growth in highway construction on U.S. industry-level productivity growth for the period from 1953 to 1989. He tested whether the increase in the highway capital stock had a disproportional impact on productivity growth in industries that are vehicle intensive. He found this to be true.

His results explained the productivity slowdown in the United States in the 1970s. Road construction was unusually productive before 1973, but not since that time; road construction today provides below normal returns. In other words, building the interstate highway system was exceptionally productive, but a second one would not provide comparable returns.

Rather than focusing on aggregate measures, some researchers began examining the impact of public capital on the economy at the state and local levels. Analysis at the state level increases sample size, improving statistical inference. It also makes sense because decisions and ownership of the public capital stock are primarily at the state and local levels.

Alicia Munnell^[7] constructed estimates of state-level public capital to examine the relationship between infrastructure and economic development. Munnell estimated production functions using state level data for the period 1970 to 1986. She found that a 1% increase in a state's public capital stock raises per-capita real gross state product by 0.15 of a percent point. This estimate is smaller than some aggregate results, but is statistically significant.

Munnell's results were challenged by Holtz-Eakin^[8] and Krol.^[9] Both researchers pointed to the fact that Munnell failed to control for unobserved differences in state production functions. Ignoring these differences can significantly bias estimates of public capital productivity. Both Holtz-Eakin and Krol found that once unobserved production function differences are controlled for, public capital is generally no longer a significant determinant of productivity. These results question the widespread view that large increases in state infrastructure investment are an important source of state economic development.

Morrison and Schwartz^[10] focused on the manufacturing sector, examining the impact of additional infrastructure investment on regional manufacturing costs. Estimating cost functions for regions of the United States for the period from 1970 to 1987, they found that additional public capital significantly lowers manufacturing costs in all regions. An additional \$1 million worth of infrastructure lowered manufacturing costs by about \$160,000 to \$180,000 per year. But a positive marginal product is not enough in and of itself to justify additional investment; there must be a positive net return after the costs of financing the investment are considered.

Tax and Spatial Issues

The studies discussed in the previous section indicate that additional infrastructure investment will lead to only modest increases in productivity and output. Three factors contribute to muting the net affect of public capital on productivity and output. First, financing additional infrastructure can result in higher taxes and interest rates. Second, new infrastructure causes economic activity to be reallocated, resulting in small net regional increases in output. Third, because new highways lower transportation costs, spatial density falls, reducing agglomeration economies.

New infrastructure projects must be financed through taxation or borrowing. Taxes levied on private economic agents distort decisions, resulting in a less efficient allocation of resources. In addition, the higher taxes raise the cost to businesses in the economy. The higher costs due to greater taxation can offset the lower production costs associated with the benefits of additional infrastructure.

Borrowing funds in capital markets to finance an infrastructure project can raise interest rates (interest rate effects are likely to be modest in global capital markets). As in the tax example, this raises business costs that can offset the benefits derived from additional infrastructure. In both cases, the net effect on business costs and production may be close to zero.

Morrison and Schwartz^[10] and Seitz^[11] found evidence to support this conclusion. Morrison and Schwartz found the annual benefits to businesses from additional public investment (lower costs) to be less than the annual marginal costs of funds in most years. Seitz found any increase in manufacturing employment resulting from additional infrastructure to be offset by the negative employment effects of the higher taxes.

The spatial reallocation of resources that results from the construction of a new highway was examined Chandra and Thompson.^[12] They investigated this relationship for non-metropolitan counties with new highway constructed during the period between 1969

and 1993. Rather than estimating a production function, they instead estimate a county earnings function, controlling for national, regional, and local factors that influence economic activity.

They find that the construction of a new highway in a county draws economic activity away from adjacent counties. Earnings in counties where the highway was constructed rise relative to counties that do not receive a new highway. Total earnings are 6% to 8% higher in the long run in the counties that get a new highway. Total earnings fall 1% to 3% in adjacent counties. Services and retail rise 5% to 8% in the county with the new highway and fall 8% to 11% in the adjacent county. They conclude the net effect of the new highway is about zero.

Boarnet^[12] confirmed this result, looking at California counties during the period from 1969 to 1988. He found negative spillovers in the case of the construction of new highways. He found the construction of a new highway to be positively related to within-county output, but negatively related to adjacent-county output. These two studies confirmed the idea that highway construction provides mostly localized benefits, with limited aggregate effects.

Furthermore, the construction of a new highway can reduce productivity because it can lower the benefits derived from agglomeration economies. By lowering transportation costs, the incentive for businesses to locate near one another falls. As a result, firms are in less of a position to capture the local geographic externalities that arise with agglomeration economies.

Ciccone and Hall^[13] found that if you double employment density in a state, average labor productivity rises by 6%. This supports the link between density and productivity. Haughwout^[14] found lower benefits to densely populated urban areas from highway construction. This result links highway construction and the associated lower transportation costs to reduced agglomeration economies. It appears that highway construction can reduce agglomeration economies, which lowers productivity and output growth.

Improving the Provision of Infrastructure

This section examines how infrastructure policy reforms can improve the efficiency associated with the construction and use of highways. Highways and roads represent one of the largest civilian public capital goods in the United States. Winston,^[15] and Boarnet and Haughwout,^[16] discussed how changing the way we finance and price our highways and roads can lead to large net welfare gains. These policy reforms would also moderate the demand for additional highway construction.

Highway construction is financed primarily using funds from the Federal Highway Trust Fund. In most cases, 80% of the funds used to build a new highway come from the federal government. The justification for the federal government's major role in financing highways was the presence of significant spillover benefits captured by individuals living outside the area where a road is built. However, the studies discussed in the last section indicated that highway benefits tend to be highly local.^[2,12] As a result, a case can be made for the elimination of federal financing of highway construction (repealing the federal gas tax and refunding the Highway Trust Funds to state and local governments).

Federal financing raises concerns because it introduces biases toward excessive highway construction. Federal funds focus primarily on construction, rather than maintenance. Funding programs ignore the higher return to road maintenance, compared with the low return on road construction. The reason for this bias is believed to be political. Voters reward elected officials for opening a new spur of a highway, but tend to take regular maintenance to an existing road for granted.

In addition, Boarnet and Haughwout^[15] pointed out that financing new highway projects with pooled tax revenues results in non-economic projects being funded. In many cases, the local benefits individuals capture from a new road exceed local costs. However, this does not make the project economic because the local benefits are often less than the total cost of building the road. As a result, total welfare is reduced when the road is built using federal funds. Instead, if local decision makers are required to finance their own roads, only those that can pass a full cost-benefit analysis will be constructed.

Congestion on many urban highways creates political pressure to build more roads. This approach has done little to solve the congestion problem. Congestion indicates the price of using the highway is too low. An alternative to the costly "build your way out of congestion" approach is to move to an efficient pricing system. More efficient use of existing highways would significantly reduce the need for additional highway construction.

Today, in the United States, a flat gas tax is used to finance highways. This tax does not solve peak-load congestion problems, nor does it accurately reflect the pavement wear associated with using roads. Instead, a toll can be levied directly on users of the highway. Efficient tolls are higher during rush hours. This gives drivers an incentive to take into account the longer commuting time associated with increasing highway congestion. Tolls can be administered electronically to minimize the inconvenience of payment for road users. The potential net welfare gain from imposing congestion tolls in the United States was

estimated to be almost \$4 billion per year in 1998 dollars.^[17]

Not only can highway construction be offset by cheaper maintenance spending, but also maintenance expenditures can be lowered by a tax that reduces highway damage. The current gasoline tax worsens highway wear and tear by trucks. Because the tax is on a per-gallon basis, trucks are built using fewer axles to improve mileage. However, highway damage depends on weight per axle, not total vehicle weight. As a result, the current tax system leads to greater highway damage than one based on a toll system that factors in weight per axle.^[15]

Road maintenance can also be forestalled by building thicker roads and highways. Winston^[15] argued that the adoption of efficient pricing and building thicker roads has a benefit-to-cost ratio of 4. This suggests that these reforms are economic and would result in a net improvement in welfare, if implemented.

On a less optimistic note, Winston^[17] argued that entrenched special interest groups, the construction industry, and public employee unions make serious transportation policy reform unlikely. The only way to get the needed reform is to privatize the construction, operation, and maintenance of the transportation system. He argued that market incentives are the only way to correct for government failure, and to improve the efficiency and quality of service.

CONCLUSION

In this article, I have argued that public infrastructure has both direct and indirect effects on the marginal products of private inputs. If the relationship between public and private inputs is complementary, public capital investment can raise productivity, employment, and output. When public and private inputs are substitutes, the impact of additional public capital on output is weaker.

The empirical evidence suggests that additional public infrastructure has only a modest impact on economic activity. The small impact is the result of diminishing marginal returns to public capital, the spatial reallocation of economic activity, higher taxation to finance the project, and reductions in agglomeration economies.

With respect to highways, many observers have pointed to alternatives to costly highway construction. Net welfare can be increased by using congestion pricing, setting user fees that more accurately reflect road

damage, building thicker roads, and by using cost-benefit analysis in project evaluation.

Economic Development, State Government Administration of

Keith Boeckelman

Department of Political Science, Western Illinois University, Macomb, Illinois, U.S.A.

INTRODUCTION

Throughout much of U.S. history, economic development has been a critical state function. Activity in this area dates to colonial times, when states first began to offer land grants, loans, and tax exemptions to subsidize industry.^[1] During the nineteenth century, states used massive infrastructure investments, such as the Erie Canal, to foster growth. After a post-Civil War period of federal dominance in the economic realm, development issues reemerged as a concern for state policy makers during the twentieth century. Since the 1970s, economic development issues have been at or near the top of most states' policy agendas. Three approaches to economic development, known as the first, second, and third waves, characterize the contemporary era. Each is summarized and evaluated below. Following this discussion, current state efforts are examined and future trends are speculated.

It is easier to describe the various approaches to economic development than it is to determine exactly what states are doing in this area or whether their efforts have the desired impact. The fact that many programs exist off budget, use intergovernmental grants, or operate through public-private partnerships complicates description. Evaluating the results of economic development programs is also notoriously difficult. States have open economies subject to a large number of national and international variables. Isolating the impact of policies on the economy is therefore a tricky proposition. In addition, factors that supposedly affect economic development, such as labor costs, are in turn affected by levels of economic development, making it difficult to ascertain what is causing what. These complications can frustrate both elected officials and practitioners in their efforts to develop coherent and effective policies.

FIRST-WAVE ECONOMIC DEVELOPMENT POLICIES

First-wave economic development efforts, also referred to as the "supply-side approach" or "locational

policies," adopt a business recruitment model. These policies try to entice manufacturing plants to locate in a state by reducing taxes, wage rates, construction and infrastructure expenditures, or other costs. Tax incentives are the most common and widely publicized first-wave policies. They typically excuse businesses from corporate income or property taxes, or reduce levies on firms that engage in economically beneficial activities, such as buying new equipment or creating jobs in the state.^[2] Other common first-wave programs include industrial development bonds, right-to-work laws, and enterprise zones. State or local governments use the former to finance the construction or purchase of industrial buildings. Right-to-work laws forbid closed-shop provisions thus weakening the collective bargaining power of unions in order to depress wage rates. Finally, enterprise zones target various tax and other incentives to putatively depressed parts of a state.

Southern states pioneered first-wave policies, beginning in the 1920s.^[3] At about the same time, these states began to create economic development agencies to spearhead business recruitment efforts. By the late 1970s, however, economic difficulties in the Northeast and Midwest led to a nationalization of first-wave policies. This trend was perhaps most evident in the rivalry to attract foreign auto plants, such as Volkswagen, Mitsubishi, and Mercedes Benz. The competition for jobs in lean economic times led to a climate of desperation where incentive programs escalated into an "arms race" as states matched and exceeded the deals their neighbors offered.^[4]

The impact of first-wave economic development policies has been a matter of substantial debate, particularly with respect to the question of whether tax policies affect a state's economy. The answer seems to depend, at least in part, on research methodology. Studies based on interviews of corporate decision makers suggest that tax incentives play a negligible role in determining where businesses locate.^[5] At best, taxes may determine which states are eliminated from contention in the early stages of the decision-making process. For the finalists in the location sweepstakes, however, factors such as transportation

and labor costs become more important in determining which state ultimately wins.^[6]

Econometric studies, however, show a more significant role for tax policy. Overall levels appear to be especially important, although targeted incentives matter in some instances, according to this research. Specifically, high tax rates are likely to reduce employment, gross state product, manufacturing investment, and the number of business locations. Tax incentives are most important in affecting where capital-intensive manufacturers move.^[7] Yet, the number of jobs affected by tax policy is usually rather small.

Any analysis of incentive programs must also note that they often distort a state's tax system by treating similar businesses unequally, because some receive breaks while others do not. Furthermore, they are regressive because profitable companies receive the majority of concessions. In addition, widespread use of incentive programs complicates tax administration, as laws are likely to change more frequently. Tax incentives can also have negative consequences that spill over a state's borders and create a negative-sum game for the nation as a whole. In other words, the money that states spend attracting businesses are a waste of national resources because the plants would locate somewhere in the United States anyway. Thus, if all states increase incentives to respond to the competitive "arms race," they not only lose revenue but they also do not create new competitive advantages.

Economic development programs that focus on labor costs, such as right-to-work laws, affect plant location decisions, particularly for those firms that do not need to be near specific markets or suppliers.^[6] Obviously, however, such policies attract relatively low-wage jobs. Existing studies suggest that enterprise zone programs tend to target businesses that would operate in the area anyway, and rarely hire neighborhood residents.^[8] Evaluations of industrial bond programs show that about 60% of the projects they fund would have occurred anyway.^[2]

SECOND-WAVE ECONOMIC DEVELOPMENT POLICIES

Second-wave policies, also sometimes known as "demand-side" or "entrepreneurial" approaches, began to appear in the 1980s. They emerged due to concerns about the cost and effectiveness of tax incentive programs, as well as the perception that the jobs created by first-wave initiatives were of low quality. These programs emphasize nurturing existing local businesses and promoting entrepreneurial activity, rather than trying to attract companies from outside the state. Resembling Japanese-style industrial

policy, at least superficially, the state government's role can include targeting investment to specific regions and industries or fostering public-private partnerships.

Specific examples of second-wave policies include high-technology initiatives, venture capital efforts, and export development programs. High-technology programs have two basic goals. Some focus on promoting hi-tech jobs in general because officials view this sector as having great potential for growth. Other initiatives attempt to preserve the viability of existing industries through technological improvements. Texas' Advanced Research Program and Advanced Technology Program are examples of the first type, while the Ben Franklin Partnership in Pennsylvania typifies the second approach. Many states administer their high-technology programs through public research universities in order to draw on the expertise of science and engineering faculty.

Venture capital programs provide loans to small, entrepreneurial businesses that may not have access to funds through traditional methods. State pension funds often serve as a source of capital for such programs. Export development initiatives assist firms in developing export markets overseas. About 40 states maintain offices abroad to administer these programs. A few states have also tried to bolster economic performance by restructuring labor-management relations or targeting industries outside the high-technology realm, but these programs have been less widely adopted.

Because they are of more recent vintage, there are fewer independent evaluations of second-wave policies than of the first wave. Existing studies suggest that high-technology business incubator programs that provide space and shared services, such as secretarial and accounting assistance, are effective. Export development initiatives appear to have a greater direct economic impact than do venture capital efforts or university-based technology programs.^[9] The public-private partnerships that many states have created to administer second-wave policies raise unique accountability issues. For example, it is not clear whether such entities must obey "freedom of information" or "sunshine" laws that govern more typical state agencies.^[10]

THIRD-WAVE ECONOMIC DEVELOPMENT POLICIES

Doubts about the effectiveness of both first- and second-wave policies led to a new approach beginning in the early 1990s. "Third-wave" initiatives reflect a retreat from direct economic management in favor

of more general “capacity-building” activities. Specifically, states began to offer different programs and to organize them in new ways. Programmatically, the third wave emphasizes fundamentals, such as infrastructure, educational improvements, and job training. Organizationally, this approach favors giving non-profits some responsibility for economic development administration and cutting back on direct state spending. It also emphasizes greater coordination between state and local governments, and among officials in a particular region.^[11] Studies of the impact of third-wave policies suggest that funding highway infrastructure raises state incomes, but not necessarily employment levels, while educational spending has little impact.^[12] The organizational innovations associated with the third wave are difficult to measure and evaluate.^[11]

STATE ECONOMIC DEVELOPMENT POLICY TODAY AND IN THE FUTURE

The appearance of a new wave of economic development policies does not necessarily wash away its predecessors. Thus, most states use program elements of all three approaches discussed in this article. As noted, measuring levels of state commitment to the various waves of economic development is difficult, in part because so much activity occurs off budget. Nevertheless, it appears that states devote the greatest amount of resources to first-wave programs, which continued to grow at least through the 1990s.^[13] This continuing dominance reflects two political advantages that the later approaches to economic development cannot match. First, supporters of first-wave efforts are often powerful business interest groups. By contrast, second-wave policies such as technology initiatives tend to have few organized beneficiaries, while they foster opposition from labor unions who see few program benefits accruing to relatively uneducated production workers. Second, it is easy for the public to draw a causal connection between a tax incentive followed by a plant location, while the benefits of second- or third-wave policies are rarely as visible.

Despite their continued popularity, there have been increasing concerns about the possible misuse of first-wave programs, especially tax incentives. State officials fear that the arms race mentality results in temptations to “give away the store” by offering packages that exceed job benefits. For example, Alabama’s offered about \$300 million to entice Mercedes Benz to come to the state at a cost per job of about \$200,000 for the 1500 positions created. In addition, states have little recourse when companies receiving incentives fail to deliver on the promised job benefits.

States have adopted various policies in response to these concerns. Perhaps the most common are “clawback laws” that require companies to pay back all or part of incentive packages if the promised number of jobs do not materialize. States are often unwilling to enforce such provisions, however, particularly if they run the risk of antagonizing local industries who are in financial trouble. Meanwhile, the general public is largely oblivious to the cost of tax incentives, perhaps because they are not part of the normal budget process. In fact, many states do not know how much they spend on incentives.^[12] Another, albeit less used, alternative to protect the public interest is to require cost-benefit analyses before offering incentives. Finally, some states have adopted “non-aggression pacts,” whereby they collectively agree to limit their use of incentives. These agreements have usually failed, however, with some pacts lasting only a few months. Efforts to get the federal government to intervene to deescalate the incentive arms race have also been unsuccessful.

Even during the robust economic times of the late 1990s, state interest in economic development did not appear to wane. Thus, it is unlikely to do so in the current, more uncertain, climate. It is not clear if states will stick with existing strategies, or opt for new approaches leading to a fourth wave of activity. Some have suggested that the next logical step for state economic development policy is to address economic inequality issues.^[14] One example of this approach would be to integrate technology development programs with efforts to train former welfare recipients for new jobs. A few states already use their economic development agencies to implement the Temporary Assistance for Needy Families program associated with the 1996 welfare reform law. Getting involved in redistributive policy brings political headaches that economic development officials may want to avoid, however, so it is not clear how far this trend will go.

Economic Development: Governance Concepts and Issues

Kuotsai Tom Liou

Department of Public Administration, University of Central Florida, Orlando, Florida, U.S.A.

INTRODUCTION

This article examines the importance of governance in the process of economic development. The article first provides a literature review about the role of government in promoting economic development and major concepts of good governance emphasized in recent studies. Then, the focus is on three policy changes and issues related to the topic of governance and economic development: 1) regulatory reform; 2) privatization policy; and 3) decentralization policy. To conclude discussions about the continuing arguments about the role of government and reforms, the increasing importance of local governments, and the contribution of non-governmental or non-profit organizations in economic development are presented.

OVERVIEW

Government has traditionally played an important role in the process of economic development. From the perspective of public policy analysis, the importance of government to economic development is primarily based on three inter-related roles, functions, or activities. First, government plays a pivotal policy role in identifying and formulating important development policies and programs to promote economic growth and social change. Next, government serves a critical managerial role in assuring the successful institutional development and reform to implement many identified development policies and programs. Last, government provides a supporting role in maintaining positive and stable political and social environments to provide the opportunity and time for the success of development policies and programs.

The study of governance is important to economic development researchers and policy makers. For researchers, the challenge is to systematically collect objective data from different countries and regions to test, verify, or create various development concepts, strategies, and theories. For policy makers, the challenge is to consider different environmental factors in their countries and to design an appropriate model of governmental intervention through the analysis of many development theories, strategies, and experiences. The interaction of researchers and policy makers is critical

to the success of economic development because of the significant consequence of negative development results.

FROM GOVERNMENT INTERVENTION TO GOVERNANCE COORDINATION

The important role of government in the modern economic system has been well recognized and accepted in the literature of public finance, development economics, and political economy. For example, with regard to specific government functions and activities in the market economy, Adam Smith emphasized three duties of the government (state): 1) protecting the society from violence and invasion by other societies; 2) establishing an exact administration of justice; and 3) erecting and maintaining certain public works and institutions.^[1] From the public finance perspective, Musgrave and Musgrave promoted three functions of government: 1) the allocation of social and other goods that the market will not of itself provide; 2) the equitable distribution of income and wealth; and 3) the stabilization of unemployment and control of inflation.^[2] Stern summarized the related literature by identifying five different arguments for governmental intervention in the economy. They were as follows: 1) a concern for market failure (arising from sources such as externalities, public goods, and imperfect information); 2) a concern to prevent or reduce poverty and improve income distribution; 3) the assertion of a right to certain facilities or goods (e.g., education, health, and housing); 4) the importance of paternalism (e.g., relating to education, pensions, and drugs); and 5) the rights of future generations (e.g., concerns about the environment).^[3] The importance of government role in economic development can be discussed in the following two areas of government intervention and governance coordination.

Government Intervention

The issue of state or government involvement in economic growth has been further emphasized and debated in the literature related to economic development. First, the neoclassical arguments of development emphasize the role of foreign trade and investment and the importance of a free market in stimulating

competition during the development process.^[4-7] They claim that the problems of LDCs result from extensive government intervention in promoting import-substitution policies that limit the scope of industrialization. They argue that one of the major factors contributing to the success of East Asia's newly industrialized countries is the adoption of export-oriented policies that encourage the process of technological adaptation and entrepreneurial maturation. They recognize the role of state in the process of development but emphasize a passive and limited role of government in such activities as maintaining stability and providing physical infrastructure.

Next, statist arguments of development indicate that the successful experience of newly industrialized countries is related not only to the operation of the free market but also to the active role of government in directing public and private resources to change the structure of their economy.^[8-11] For example, many of the successful newly industrialized countries emphasize a general incentive policy to encourage the accumulation of production factors (tax measures and research and development) and an industrial targeting policy to promote the growth of particular industries (e.g., subsidizing credit or import protection).

Considering both the market and the state arguments, Aoki, Kim, and Fujiwara promoted a market-enhancing view, which emphasized the role of government policy to facilitate or complement private-sector coordination.^[12] They maintained that the previous approaches viewed the market and government as the only alternative and as mutually exclusive substitutes, and that the market-enhancing approach stressed the mechanisms whereby government policy is directed at improving the ability of the private sector to solve coordination problems and overcome other market imperfections. One example of the mechanisms is the important role of government-private-sector intermediaries (e.g., deliberation councils and national wages council) in facilitating information change to avoid possible market coordination failures and in realizing an efficient allocation of credit under the condition of information asymmetry.

Many studies of economic structure adjustments in developing countries and economic reforms or transitions in postsocialist nations also address the issue of governmental involvement in economic development. With regard to structural adjustments, for example, researchers emphasize the importance of the administrative and political functions of the state in the successful implementation of an adjustment program or a reform policy.^[13,14] Similarly, many studies of economic transitions in postsocialist countries emphasize the issue of stabilization in the process of economic transformation and identify the important role and

involvement of government to assure the success of the transition.^[14-17] In summary, Liou identified five major roles of government in the process of China's post-Mao economic reforms, including: 1) government as a promoter of economic growth (i.e., formulating and implementing growth policies); 2) government as a manager of the economy (i.e., managing fiscal and monetary policies); 3) government as a distributor of income (i.e., distributing resources between different regions and among different social groups); 4) government as a regulator of industry (i.e., regulating for social and economic reasons); and 5) government as a protector of citizens and business (i.e., protecting citizens and business from foreign attacks as well as criminal and illegal activities).^[18]

Governance Coordination

Since the 1990s, many international aid organizations have recognized the problems of governance in their efforts to promote economic and social development in many developing countries.^[19] The governance problems come from two sources: the abuse of public funds by local elite groups and the ignorance of local political problems by the international donors. The donor organizations believe that good governance is necessary for economic development in these countries. They promote good governance concept and emphasize the need for governance reform in these countries.

Despite its popularity, the concept of good governance has been related to different definitions and elements. World Bank, for example, indicated that governance refers to the exercise of the power of the state in managing a country's social and economic resources, as well as the related mechanisms for public accountability, rule of law, transparency, and citizen participation. They identify four specific elements of governance: 1) accountability (i.e., officials being answerable for government behavior), 2) participation (i.e., the involvement of citizens in the development process), 3) predictability (i.e., legal environment being conducive to development), and 4) transparency (i.e., the availability of information to the public and the clarification of government rules, regulations, and decisions).^[20,21]

Pierre and Peters explained that governance is about government's changing role in society and its changing capacity to pursue collective interests under severe external and internal constraints. They also identified four elements of governance: 1) the importance of networks (i.e., the use of networks to dominate public policy); 2) from control to influence (i.e., government's influence through a continual process of bargaining and persuasion); 3) blending public and private resources (i.e., the importance of network framework);

and 4) use of multiple instruments (in developing and implementing public policies).^[22,23]

Besides these basic concepts and definitions, Shepherd pointed out the importance of other governance areas to economic and social development, including, for example: public expenditure patterns and revenue growth, local institutional development and rural local development, inclusiveness and access into sector reforms, the elimination of bad government, and the incorporation of civic society and Non-Government organizations.^[24] Similarly, Kliksberg also emphasized other public management capacity to support economic and social development, including: the importance of coordination between economic and social policy, the improvement in intraorganizational coordination, the need for decentralization, the potential of participation, and the renewal of organizational structure.^[25]

In sum, the governance approach to economic development changes the traditional dominant role of government operation and welcomes the participation of private and non-governmental organizations and alternative methods of operation. Network coordination between government agencies and these organizations is one of the major requirements for the success of economic development.

CHANGES IN REGULATION, PRIVATIZATION, AND DECENTRALIZATION POLICIES

To assure the success of economic growth, many researchers of economic development recognized the importance of an efficient and ethical public management system in developing and implementing sound development policies and programs, as well as the need to reform the public sector to overcome many unethical and inefficient bureaucratic dysfunctions and problems.^[26] To achieve these goals, recent reform policies have emphasized not only reforms or changes of the civil service system, public budgetary system, and state-owned enterprises (SOEs), but also restructuring and adjustment policies in market liberalization, privatization, deregulation, and decentralization. The policy measures emphasized in recent government reforms have broadened the traditional concerns of improving management and operational issues in public organizations to a new focus on good governance for successful development. The policy changes of regulatory reform, privatization, and decentralization are furthered explained as follows.

Regulatory Reform

Public policy researchers have noticed that governments often pursue their policy objectives through

regulation policies and use them to replace traditional public finance instruments.^[27] Government regulation refers to any attempt by the government to control the behavior of citizens, corporations, or subgovernments.^[28] Regulation may consist of such categories as economic regulation, social regulation, and administrative regulation.^[29,30] Economic regulation focuses on direct government intervention in corporations and market decisions, such as pricing, competition, and market entry or exit. Social regulation is related to government protection of citizen and social values, such as health, safety, environment, and social cohesion. Administrative regulation has to do with government formalities and paperwork. The instruments used in these regulation policies include, for example, laws, orders, and rules issued by all levels of government.^[30]

The pervasive use of regulation and the growth of regulatory cost have resulted in many suggestions for regulatory reforms. The purpose of regulatory reform is to improve the quality of regulations in terms of enhancing performance, reducing costs, or finding alternative policy tools. The reform activities range from revising a single regulation to scrapping and rebuilding an entire regulatory system (policies, processes, and institutions). Deregulation is part of the overall regulatory reform, which refers to complete or partial elimination of regulation in a sector to improve economic performance.^[30]

With regard to economic development, regulatory reforms are especially useful in promoting economic growth, firm competitiveness, and consumer welfare. Reform activities for industry development focus on the removal of such barriers or burdens as rigidities, disincentives, and market distortions, and the promotion of competition, entrepreneurship, technological innovation, productivity, structural adjustment, and other important market issues. Reforms that emphasize the increase of the transparency and the reduction of red tape and paperwork are also valuable for investors and ordinary citizens because of the time saved on information communication and collection.^[30]

Privatization Policy

The second major policy change in governance is the increase of privatization policies emphasized by policy makers in developed and developing countries. The word “privatization” has been used in many different ways in relation to public-sector reforms. In the broadest sense, it refers to a whole range of reformative actions designed to subject administrative activity to the disciplines of the marketplace; in other cases, it may be specialized as acts of selling government-owned

enterprises, assets, or shareholdings.^[31–33] In the United States, policy makers and public managers emphasize the use of privatization policy to deal with the problem of fiscal retrenchment (due to such changes as tax revolt, “Reaganomics,” etc.) and continued service demand. Privatization policies consist of such options as contracting out (outsourcing), franchising, local (service) shedding, public–private partnerships, grants, subsidies, vouchers, asset divestment, competitive contracting, volunteer services, and total privatization.

The arguments for privation policies are based on some beliefs, such as government should not provide services or products when these services or products are available in the private market; government is better when it is smaller; private firms are more efficient than government agencies; and private managers are better than public administrators. Specifically, privatization policy offers such advantages as improving government operations, meeting short-term project needs, lowering the costs involved in service delivery, adjusting for resource limitations, and improving service quality.^[34] The potential problem associated with privatization policy is the increasing dangers of sector blurring and the twilight zone, where individuals fall into a situation in which they will receive less than optimal treatment as citizens receiving services from government or as customers from private firms.^[35,36] It is believed that substantial benefits and significant values and protections may be lost in the transition from government to the private sector.^[34,36,37]

Finally, privatization policy has also been emphasized in many developing or economic-transforming countries.^[38–41] For these countries, privatization policy is closely related to the policy of reforming SOE. As a part of economic liberalization measures, privatizing SOE is designed to improve the operation of SOE (maximizing benefits, reducing cost, or enhancing effectiveness) and to reduce the role of government in the market economy. Privatization of SOE consists of such measures as contracting out, restraining and redeveloping labor, denationalizing and disinvesting, imposing budgetary constraints, promoting marketization, and introducing competition.

Decentralization Policy

The last major change in governance is the importance of decentralization policies in many developed and developing countries.^[42–44] In the United States, decentralization policies were emphasized as a result of the huge federal budget deficit, the cutback of federal aid, and the Reagan federalism philosophy. In many developing countries, decentralization policies were

adopted because of the emphasis on structural adjustment policies by international assistance organizations (the World Bank and the International Monetary Fund). The structural adjustment policies call for, among other things, decentralization of national government administration and reduction of the central government’s control over or intervention in the economy.^[45,46]

Decentralization has been defined as the transfer of responsibility for planning, management, and the raising and allocation of resources from the central government and its agencies to field units of government agencies; subordinate units or levels of government; semiautonomous public authorities or corporations; area-wide, regional, or functional authorities; or non-governmental private or voluntary organizations.^[47] Researchers have debated the advantages and problems of the decentralization policy.^[42–44] On the one hand, they recognize that advantages of decentralization policy include emphasizing administrative responsiveness, increasing political participation, and promoting democratic principles.^[42–44] On the other hand, they notice that decentralization policy may generate such problems as increasing disparities among regions, jeopardizing economic and social stability, and affecting administrative efficiency.^[48] They maintain that these problems may result from the lack of resources and information at the local level, and the low administrative skills, training, and educations among local public employees.

To implement decentralization policy, it is important for policy makers to consider the decentralization from a comprehensive strategic planning perspective. The strategic planning perspective emphasizes important policy components, such as understanding political, social–economic, and institutional environments of central and local governments; analyzing constraints and opportunities of these governments; considering policy scope and nature; developing an action plan of decentralization; and focusing on capacity building and empowerment. The component of capacity building is especially important, as it includes such areas as institutional, personnel, fiscal, and information capacity building.

CHALLENGES AND IMPLICATIONS

The previous review of governance concepts and policy changes provides the background information for the following discussion of major challenges in the study of governance and economic development. Three issues are especially important here: 1) the need of government and reform; 2) the importance of regional or local government; and 3) the contribution of non-governmental or non-profit organizations.

The Need of Government and Reform

Economic development researchers are continually debating the role of government in the process of economic development. The market approach of development emphasizes the role of international trade and investment and the importance of a free market in stimulating competition during the development process. The statist approach stresses the active role of government in directing public and private resources to change the structure of their economy. A third market-enhancing approach considers advantages of the market and the state approaches and promotes the role of government policy to facilitate or complement private-sector coordination and overcome other market imperfections.

The recent experience of the Asian financial crisis has not resolved the different arguments about the issue of governance. The causes of and cures for the Asian financial crisis are directly or indirectly related to the government policy and managerial activities that are important to economic development.^[49–53] On the one hand, political leaders and governmental officials have been questioned about such problems as excessive governmental intervention, lack of sound regulation, and supervision of financial sectors, as well as unethical and illegal government–business connections. On the other hand, suggestions to resolve financial crisis call for governmental action in strengthening central banks; establishing a prudent banking regulation system; and reforming administrative, political, and legal systems.

The lesson learned from these different arguments is that government continues to play an important role and government reforms are needed to assure the success of economic development. The challenges for policymakers are not only to understand different arguments of governance but also to design their own development model, which considers the balance of public and private sectors and the trade-off between market and government failure. In other words, they have to promote some specific development policies to coordinate resources in public and private sectors in order to deal with market failure problems and to compete in the global economic system. The development model must consider the reform of public management system to overcome many traditional bureaucratic problems and to promote important development values such as efficiency, equity, and accountability.

The Importance of Regional or Local Governments

The impact of decentralization policy and other changes in governance policy has resulted in the

increasing role of regional (or state) and local governments in promoting economic development programs and activities. In the United States, state and local governments have expanded their efforts in economic development policies and programs to deal with fiscal problems and new challenges.^[54–59] On the one hand, local governments have experienced continuing fiscal difficulties and challenges, such as the increasing difficulties in raising adequate revenues (because of the impact of tax revolts) and the increasing demand for public services (because of the cutback of federal social programs). On the other hand, local officials have become actively involved in economic development promotion activities, because they recognized many business development opportunities resulting from changes in the advancement of communication technology and the globalization of the world economy. The formal change refers to the development of telecommunication systems and web-based Internet services, which significantly reduce the barriers of time and distance among business communities. The latter change has to do with the end of the Cold War and the development of many postsocialist countries, which provides additional businesses and markets for local economy growth.

Researchers of regional economic development have supported the involvement of state and local governments in promoting business development. For example, Bartik used the market failure approach to explain the importance of a regional economic development policy.^[60] This approach has strengths, such as allowing a wise use of government resources, because it focuses on what private markets are unable to do, and leading to goals that are measurable in the common currency of dollar benefits. The limitations of the market failure approach consist of the lack of precise information about the magnitude of some non-market benefits, no consideration of distributional effects of regional economic development policies, and overlooking the benefits and costs of one region's policies in relation to other regions. In the absence of federal government involvement, however, Bartik believed that encouraging regional governments to pursue regional efficient policies is likely, on average, to increase the efficiency of the national economy.^[60]

The economic development strategies emphasized by state and local governments vary depending on the environment of their communities and the different goals of their economic development plan. In general, four types of development strategies have been adopted: 1) subsidizing traditional inputs such as capital (e.g., direct loans and loan guarantees, tax-exempt bond financing, and development corporations), land (e.g., land banking and site development provision), and labor (e.g., low cost/mass production, and high quality/lean production); 2) lowering political costs

of doing business, including tax abatements and incentives and limitations on the regulatory environment; 3) promoting entrepreneurial activities of market development (e.g., export promotion, research, and dissemination) and business services (e.g., policy planning, research and development, and support and consortia); and 4) developing attractive social amenities (e.g., arts and environment) and improving distressed areas (e.g., enterprise zones).^[61] All of these strategies are directly or indirectly based on or related to policy or managerial issues of governance.

The Contribution of Non-Governmental or Non-Profit Organizations

Many market-oriented policy changes, such as deregulation and privatization, have resulted in the rise and contribution of non-governmental or non-profit organizations in the delivery of public goods and services.^[62–66] In many developing countries, policy makers emphasize the development of these organizations as service providers because of their proximity to the persons served (establishing a long-term relationship with the communities); their cost effectiveness (using volunteers and relying on donations); and their flexibility, innovativeness, dedication, and responsiveness.^[62–66]

With regard to economic development, researchers have recognized the important contribution of these organizations to economic growth and social development. For example, in the United States, Rubin emphasized the importance of community-based development organizations (CBDOs) to promote economic development.^[67] As neighborhood-based non-profit organizations, CBDOs help many distressed communities to receive financial support, build affordable housing, provide job-related training activities, and create many employment opportunities. Similarly, Bhatt and Tang examined the development of group-based microfinance to promote economic development in many developing countries.^[68] Recognizing many problems associated with developmental finance in developing countries, they pointed out the contributions of group-based lending programs to help the poor generate income and employment opportunities as well as to encourage grassroots participation and empowerment in disadvantaged communities.

Despite their popularity, many non-governmental or non-profit organizations experience problems such as lacking managerial skills, facing uncertain financing and erratic regulation, encountering fragmentation and no coordination, and falling short on standards of transparency and accountability. To overcome these problems, researchers emphasized the importance of forming partnerships between public development agencies, non-governmental organizations, and private

voluntary organizations on the one hand, and investing in capacity and institution building on the other hand to improve the effectiveness of their organization management.^[67]

CONCLUSION

Government continues to plan an important role in the process of economic development. This article has reviewed major literature related to traditional governmental intervention theories and new governance concepts. It has also examined major policy changes in the areas of deregulation, privatization, and decentralization. The scope of recent policy changes emphasizes not only structural or process changes within the governance system but also the interaction between government and market. The market-oriented reform policies have significant impact on future economic development programs. The importance of local governments and the contribution of non-profit or non-governmental organizations to economic development will certainly change the traditional arguments related to the issue of governance and economic development. Future research on new changes of these organizations will contribute to the overall literature of economic development.

Economic Development: International

Cal Clark

Department of Political Science, Auburn University, Auburn, Alabama, U.S.A.

INTRODUCTION

Issues of international development have given rise to two important sets of policy debates over the postwar era. The first involves how to best promote national development. During the second half of the twentieth century, several distinct stages evolved, beginning with a consensus that was followed by a series of heated debates. Economic development practices in the United States constitute the second major policy domain linked to international development. Until the 1980s, economic developmental strategies within the United States had little concern or connection with international development, but this has changed radically since then, both because globalization has had a major impact on the American economy and because there is growing recognition of parallels in the central issues and dilemmas.

INTERNATIONAL ECONOMIC DEVELOPMENT STRATEGIES

For the first two decades of the postwar era, there was general consensus that economic development in the form of industrialization was highly desirable and that the economic, social, and political dimensions of development were generally reinforcing. This *modernization theory* assumed that the western experience constituted the universally valid path to development. Thus, it advocated the creation of western economic and political institutions (e.g., capitalism and democracy) in the developing world, as well as the replacement of traditional societies and cultures by modern values, which would promote economic and political change. While the modernization approach advocated westernization and capitalism, its developmental economics generally presumed that the state had to play a leading role in the industrialization of “late developers.”^[1]

In terms of economic development itself, growth is relatively limited in agricultural societies, but once a nation achieves the *take off* of industrialization, productivity and consequently GNP growth accelerate, as sketched in Fig. 1.^[2] This figure also shows that the nature of industrialization has changed dramatically during the 19th and 20th centuries in terms of what industry was the most advanced or technological

driver: first textiles, then iron and steel, then automobiles, and most recently high-tech and advanced electronics. Conventionally, it was assumed that the growth of the tertiary or service economy that succeeds industry in this model would result in decelerating productivity gains and economic growth, as indicated by line 1 in Fig. 1. However, the recent surge in the high-tech and information industries has led to the argument that these new technologies have generated another upswing in productivity and growth (denoted by line 2 in Fig. 1) that has been labeled the new economy.^[3] This also spotlights the increasing centrality of what has been termed *the creative class* for sustaining development in postindustrial societies.^[4]

By the late 1960s, the continuing impoverishment of much of the Third World indicated that development was far from as simple and automatic as the modernization school was wont to assume. Consequently, it came under sharp challenge by *dependency theory*, which argued that the capitalist economic relations advocated by the dominant paradigm actually prevented and perverted development in much of the developing world due to the market power exercised by corporations in the industrial core.^[5,6] The strident debate between these two schools of thought waned during the 1980s, though, when economic failure in the Soviet bloc and many statist economies discredited the dependency approach.

The winding down of the debate between the dependency and modernization schools produced two very different theoretical reactions that, in turn, set off a new debate about the political economy of development. On the one hand, laissez-faire economics became something of an orthodoxy in many parts of the development community—among economists, political leaders in the industrialized world, aid donors (e.g., the World Bank and International Monetary Fund), and many reformers in the Third World itself. In contrast, the most dynamic and successful region in the global economy (i.e., East Asia) pointed in exactly the opposite direction because of the strong state leadership there in promoting economic upgrading by aggressive industrial policy. Thus, the advocates of laissez-faire were soon under strong challenge from the proponents of the developmental state model. The cleavage between the laissez-faire and developmental state models, in essence, can be viewed as a

Fig. 1 Changes in leading economic activity and the rate of productivity and GNP growth. Line signifies rate of annual GNP and productivity growth. Line 1 represents conventional theory; line 2 represents the theory of the new economy. (From Ref.^[12], p. 155.)

splintering of the original consensus in modernization theory that capitalism and state economic leadership could be combined productively. Rather, one side in this debate believed that the market should rule, while the other side stressed the importance of a nation's industrial policy.^[7]

In addition, a new sharp controversy erupted in the late 1990s, this time between the advocates and critics of globalization or the rapidly growing economic interdependence (i.e., trade and capital flows, and the activities of multinational corporations) across national borders that has marked the late 20th century. Both the scholarly and the popular discussion of globalization are quite polarized. For some, globalization suggests that the new millennium (the 21st century) will actually live up to its name with greater prosperity in many nations, less hierarchic relations in the business world, the spread of democracy in an historic third wave, and many fewer threats to world peace in a global village. Conversely, others view globalization as the primary driving force behind alarmingly regressive change. In particular, they cite the growing inequality and social turmoil in the developed world, the exploitation of developing nations, and the subversion of indigenous cultures and values by coca-cola capitalism, all stemming from the decreased ability of governments to protect the public interest from corporate policy.^[8-10] Although far from being resolved, the debate over globalization highlights Schumpeter's

key insight that economic development involves creative destruction.^[11] New industries arise but only as old ones are destroyed, creating massive costs of adjustment and social turmoil. Certainly, the faster pace of creative destruction associated with globalization is creating a massive challenge for many governments.

ECONOMIC DEVELOPMENT POLICY IN THE UNITED STATES

Since the 1980s, the growing exposure of the U.S. economy to international competition, popularly termed globalization, has brought momentous changes affecting the American economy, society, and lifestyles. The social and economic changes associated with globalization have certainly been substantial and, in some ways, unsettling. In the 1950s and 1960s, the United States clearly had the most productive and competitive economy in the world based on mass production techniques of standardized goods. During the 1970s and 1980s, in contrast, America's leading economic position came under challenge for two interconnected reasons. First, the transportation and communications revolutions made it easier to locate mass production factories away from the existing industrial centers to take advantage of lower wages. Second, affluence made consumers increasingly eager to buy more specialized and higher-quality goods than the traditional mass production

techniques could fashion. The recession of the early 1990s, in particular, raised fears about America's ability to retain its industrial leadership and prosperous lifestyle. By the mid-1990s, however, many U.S. corporations had responded quite well to this challenge, reorganizing themselves to promote high-quality and high-tech production and moving into advanced and sophisticated service industries, although more recently even some of these sectors have fallen victim to significant outsourcing. Moreover, this transformation from an Industrial Age to an Information Age economy has done little, if anything, to help many of the communities and workers who had depended on the traditional industries for their well being.^[8,9,12–15]

The governmental response to the challenge of globalization differed dramatically between the national and state–local levels. The United States has long had a tradition or public philosophy of limited government, which has resulted in a government that is smaller and weaker than almost any other country in the developed world.^[16] This laissez-faire tradition, therefore, militated against a turn to industrial policy to help reinvigorate the nation's international competitiveness and manage the considerable transformation of the American economy that was under way. In fact, the federal government took quite limited action. In ironic contrast, however, almost all state and many local governments made an explicit commitment to promoting their communities' economic development,

in almost polar opposition to the laissez-faire approach of national policy. This is ironic because the federal government is seen as more liberal than most state and local ones and, thus, would be expected to pursue more interventionist economic policies.^[17]

State and local economic development activities and programs span a wide gamut, although two principal types or strategies can be discerned, as summarized in Table 1. The first represents the traditional strategy of attracting new investment through lowering the cost of doing business in a given locality either by subsidizing firms' inputs (e.g., capital, land, and labor) or by limiting the political costs of doing business (e.g., minimizing taxes and regulation). Because these incentives were generally targeted at large mass production industries, the strategy of using them came to be called (somewhat sarcastically) smoke-stack chasing. The other, newer strategy, which might be termed promoting entrepreneurship, seeks to stimulate business expansion and creation by developing new markets, by providing services that enhance business operations (e.g., human capital development, support for research and development), or by offering a community with attractive amenities.^[12,18–21]

An initial wave of state–local economic activism began in the years before World War II and continued for the first decade or so after the war. The central thrust of this wave was a drive by poorer and less industrial regions, primarily the South, to catch up

Table 1 Changing models of state–local economic development policy

	Smoke-stack chasing	Promoting entrepreneurship
Theory of growth	Growth is promoted by lowering the factor costs of production by government subsidies of capital and land and by low taxes.	Growth is promoted by discovering, expanding, developing, or creating new markets for local goods and services.
Focus of efforts	1. Stimulate relocation of large, established firms. 2. Government supports low-risk enterprises. 3. Any firm is a suitable target for aid.	1. Stimulate new and small business formation and expansion. 2. Government nurtures high-risk enterprises and activities. 3. Use strategic criteria for aid.
Desirable firms	Large existing ones	New start-ups, small firm, high tech, environmentally friendly
Desirable labor force	Low-cost labor	Skilled and flexible
Primary government contribution	Low-cost land and tax subsidies	Access to advanced technology and finance capital
Governments role	Government should follow and support private decisions about where to invest, what businesses will be profitable, and what producers will sell—basically laissez-faire	Government should help to identify investment opportunities for the private sector (i.e., new markets, products, and industries)—movement to create public–private partnerships
Location assets	Comparative advantage based on physical assets	Comparative advantage from social and environmental amenities
Market focus	Local and regional	National and international

with the more affluent parts of the nation. It focused on the conventional strategies of subsidizing business inputs and lowering political costs. The South's ability to lure industry from the Northeast and Midwest proved so successful by the 1950s that the old industrial heartland decided to fight fire with fire by emulating the South's locational incentives. By the early 1960s, the Northeast and Midwest had matched, if not surpassed, the South in incentive policies. A new wave in state and local economic development policy commenced during the 1970s and 1980s in response to the growing economic stress generated by America's shift in the global economy and by the declining amounts of federal aid. Traditional locational incentives assumed a major role in this offensive, but there was a turn to promoting entrepreneurship strategies, in large part because globalization was luring most of the smoke stacks out of the country altogether. This change in development strategy did not turn out to be necessarily permanent, as the recession of the early 1990s brought a renewed emphasis on competitive smoke-stack chasing.^[4,12,19–23]

CONCLUSION

The policy issues outlined in the last two sections remain unsettled as the 21st century opens. Globalization, for example, has certainly been a double-edged sword in regard to its impact on the United States, as the new technologies that are driving it both undercut the nation's position in traditional industries and create the foundation for a new economic surge in the high-tech and advanced services sectors, in line with the image of creative destruction. In terms of policy, the commitment of the United States to a relatively small government and laissez-faire policies has created a paradox for reacting to the challenges of globalization. Business is able to be flexible and innovative, allowing the United States to become the world leader in most of the emerging Information Age industries. However, the country is constrained in its attempts to improve education, build new infrastructure, and retrain workers whose skills have become obsolete, all vital tasks for retraining competitiveness at the top of the international product cycle, leaving the U.S.'s future competitiveness as something of an open-ended question.^[4]

Economic Efficiency

Brian E. Dollery

School of Economics, University of New England, Armidale, New South Wales, Australia

Joe L. Wallis

Department of Economics, University of Otago, Dunedin, New Zealand

INTRODUCTION

Economic efficiency is defined in three main ways in economic discourse. First, technical or productive efficiency refers to the use of resources in the technologically most efficient manner. Obtaining the maximum possible output(s) from a given set of inputs, or technically efficient production, was first defined with precision by Farrell^[1] and approximates what laypeople commonly conceive of as “best practice” in production. A somewhat looser term, covering the social and technological dimensions of productive activity, was subsequently developed by Leibenstein^[2] and took the name “X-inefficiency.” Leibenstein^[2] argued that although X-inefficiency (sometimes also termed organizational slack) derives primarily from a lack of motivation by productive agents, factors such as the incomplete specification of labor contracts, incomplete knowledge of production functions, and the lack of complete markets for some inputs, including market information, can also explain the existence of X-inefficiency. The second measure of economic efficiency, known as allocative efficiency, refers to the efficient distribution of productive resources among alternative uses so as to produce the optimal mix of output. In the jargon of economics, under conditions of “perfect competition,” the optimal output mix arises through consumers responding to prices that reflect the true costs of production, or “marginal costs.” Allocative efficiency thus involves an interaction between the productive capacity and consumption activity of society. Dynamic or intertemporal efficiency represents the third way of defining economic efficiency. The notion of dynamic efficiency can be traced to Joseph Schumpeter’s^[3] emphasis on innovation and his argument that the perfectly competitive conditions of allocative and productive efficiency were not necessarily the most conducive to long-term innovation and economic growth. In contrast to productive efficiency and allocative efficiency, dynamic efficiency is a much less precise concept with no universally agreed upon formal definition. In general terms, dynamic efficiency refers to the economically efficient

usage of scarce resources through time, and thus, it embraces allocative and productive efficiency in an intertemporal dimension.

BACKGROUND INFORMATION

Economics is said to be founded on the acultural and ahistorical principle of relative scarcity. In this sense, relative scarcity characteristically refers to the universal relationship between limited means and unlimited wants representative of the human condition. Available means or resources are thus scarce relative to the various ends to which they can be devoted, which necessarily implies economizing in the allocation and use of scarce resources. If means were unlimited, or human wants limited, then efficiency in the use of resources would not be necessary. But, given the pervasive existence of relative scarcity in the real world, the efficient employment of limited productive means to fulfill unlimited consumption wants becomes a critical issue. It is thus clear that the concept of efficiency plays a central role in economic analysis and economic discourse.

Interaction between “rational maximizing economic agents” occurs within the context of exchange relationships, with the market mechanism acting as the basic coordinating structure. Although economics focuses on voluntary interaction in exchange relationships, it is important to emphasize that other coordinating mechanisms coexist with exchange relationships in human society. Kenneth Boulding,^[4] in his *Economics*, distinguishes between three broad groups of social organizers. First, the “threat system,” based on interaction of the type “you do something I want, or I will do something you do not want,” underlies the existence of organized government, thus providing for the existence and enforcement of property rights and other legal entitlements and obligations. Second, the “integrative system” embraces such things as love and hate, altruism, affection, and so forth, and consequently, generates social structures like the family, community, and nation, which serve to foster and

legitimize the operations of the threat and exchange systems. Finally, and in direct contrast to the threat system, the “exchange system” is based on mutual gain epitomized by interaction of the type “you do something for me, and I will do something for you.” Exchange or market relationships are thus premised on the twin notions of voluntarism and mutual benefit.

Given the historical existence of market interaction involving the voluntary transfer of property rights between buyers and sellers, economic theory must explain why exchange relationships arise and endure. In essence, it is argued that rational maximizing economic agents exchange property rights through the market mechanism, because they benefit from such exchange. Mutual benefits occur due to the gains from trade accruing to all market participants as a consequence of the law of comparative advantage. The law of comparative advantage holds that individuals, firms, and nations can raise their incomes by specializing in that sphere of economic activity where they possess a greater degree of relative (and not absolute) efficiency, and by exchanging property rights for the output of other economic agents specializing in areas where they, in turn, possess a greater degree of relative efficiency.

While microeconomic theory is centrally concerned with the behavioral implications of the universal existence of relative scarcity, microeconomic policy focuses on measures designed to reduce the extent of scarcity and to alter the burden of scarcity among members of society. Put differently, microeconomic policy seeks to diminish the degree of relative scarcity by improving economic efficiency and to redistribute the burden of scarcity by modifying income differences between individuals. For example, the program of privatization in the United Kingdom, public sector reform in New Zealand, and airline deregulation in Australia represent cases of efficiency—enhancing microeconomic policies. By way of contrast, federal government efforts aimed at the equalization of the financial capacities of the various provinces and territories in Canadian fiscal federalism, drought relief programs in South Africa, and unemployment benefit systems in Western Europe, are instances of microeconomic policy interventions directed at redistributing the burden of scarcity among different individuals and groups in society. Thus, whereas microeconomic theory attempts to explain how markets work, microeconomic policy deals with how well markets can work.

Economic efficiency is defined in the following three main ways in economic discourse.

PRODUCTIVE EFFICIENCY

First, technical or productive efficiency refers to the use of resources in the technologically most efficient

manner. Obtaining the maximum possible output(s) from a given set of inputs, or technically efficient production, was first defined with precision by Farrell^[1] and approximates what laypeople commonly conceive of as “best practice” in production. A somewhat looser term, covering the social and technological dimensions of productive activity, was subsequently developed by Leibenstein^[2] and took the name “X-inefficiency.” Leibenstein^[2] argued that although X-inefficiency (sometimes also termed organizational slack) derives primarily from a lack of motivation by productive agents, factors such as the incomplete specification of labor contracts, incomplete knowledge of production functions, and the lack of complete markets for some inputs, including market information, can also explain the existence of X-inefficiency.

Regardless of whether we accept productive efficiency or the broader concept of X-inefficiency, this notion of economic efficiency is insufficient, because the efficient production of goods does not consider the consumption desires of society. It is pointless to produce goods efficiently if people would rather consume some other combination of goods. Accordingly, additional measures of economic efficiency are necessary.

ALLOCATIVE EFFICIENCY

The second measure of economic efficiency, known as allocative efficiency, refers to the efficient distribution of productive resources among alternative uses so as to produce the optimal mix of output. In the jargon of economics, under conditions of “perfect competition,” the optimal output mix arises through consumers responding to prices that reflect the true costs of production, or “marginal costs.” Allocative efficiency thus involves an interaction between the productive capacity and consumption activity of society.

Historically, economic theory has been chiefly concerned with allocative efficiency, and only in recent times, has attention been focused on productive or X-inefficiency. Perhaps the main reason for this is the central position traditionally occupied by the perfectly competitive model in neoclassical theory. Under perfect competition, market forces ensure an absence of X-inefficiency, because, with decreasing returns, firms must produce at the minimum point of long-run average cost. Any producer that exhibits X-inefficiency will thus not pass the “survival of the fittest” test.

A major accomplishment of economic theory resides in the establishment and refinement of the properties of allocative efficiency. Two approaches to the problem of allocative efficiency have been developed.

Pigouvian Approach

First, the partial equilibrium or Marshallian approach represents the primary method of studying particular markets in isolation. This technique examines the equilibrium conditions in a single market on the assumption that the prices of all other commodities and factors of production are given. It is evident that a partial equilibrium approach does not allow for feedback effects between markets. In practice, the partial equilibrium or Marshallian approach is especially suitable for markets with output that is not a significant item in total expenditure or highly substitutable for any other single commodity.

In terms of the Marshallian approach, the conditions for allocative efficiency were first specified by Pigou.^[5] In essence, Pigou argued that allocative efficiency occurred when the benefit to society of consuming some good or service exactly equaled its cost to society. In technical language, allocative efficiency for private goods occurs where marginal social benefit equals marginal social cost; that is, no divergence between private and social benefits and costs exists. In intuitive terms, this means that the resultant price and quantity accurately reflect the degree of relative scarcity for this good or service.

Paretian Approach

The second major approach to the problem of allocative deficiency is the general equilibrium or Walrasian approach, which examines equilibrium conditions in all markets simultaneously. Because all markets are analyzed at the same time, interrelationships between markets and feedback effects occupy a central position in the general equilibrium approach.

Whether a partial or general equilibrium approach should be employed depends largely on the problem at hand. For instance, if the primary concern is a proposed policy change that has a direct impact on many sectors of the economy simultaneously, then a general equilibrium approach is clearly appropriate. An example of this kind of problem would be the introduction of, or modifications to, general sales tax. On the other hand, if the main concern was a proposed policy change that has a direct effect on only one sector, then a partial equilibrium analysis would probably suffice. Excise taxes on items such as cigarettes and liquor constitute examples of this type of problem.

In terms of the general equilibrium or Walrasian approach, the conditions for allocative efficiency are somewhat more complex. In fact, allocative efficiency in the general equilibrium context requires the simultaneous concurrence of three conditions. First, economic efficiency in production must occur such that

no intersectoral reallocation of resources can increase the output of any economic good without decreasing the output of some other economic good. In economic jargon, this means that the marginal rates of technical efficiency of input factors must be equal in all production sectors at current factor market prices. Second, economic efficiency in consumption must occur such that no interpersonal reallocation of commodities can increase the well-being (or utility) of some consumer without decreasing the well-being of some other consumer. In technical terms, the marginal rates of substitution for all goods and services must be equal for all consumers at prevailing market prices. And finally, overall economic efficiency in production and consumption requires an optimal conformity between economic efficiency in production and economic efficiency in consumption, such that a change in the composition of output cannot increase the utility (or satisfaction derived from consumption) of some consumer without decreasing the utility of some other consumer. In technical language, a given set of market-determined prices will equal the marginal rate of transformation in production and the common marginal rates of substitution in consumption. If these three conditions are met, then society is said to have achieved high-level optimality in the sense that allocative efficiency occurs in all spheres of economic activity.

Walrasian general equilibrium is said to be Pareto efficient in the sense that it is impossible to improve anyone's welfare by altering production or consumption without impairing someone else's welfare. The concept of Pareto efficiency derives from the work of Vilfredo Pareto,^[6] in his 1906 *Manual of Political Economy*, and forms the basis of much of contemporary welfare economics. A central proposition of neo-classical welfare economics holds that if all prices are market determined, then a Pareto-efficient general equilibrium will ensue. In other words, the operation of competitive markets in a capitalist economy automatically ensures that allocative efficiency will occur in all markets. No corrective intervention by governments can improve upon this outcome, because it is already Pareto efficient.

DYNAMIC OR INTERTEMPORAL EFFICIENCY

Dynamic or intertemporal efficiency represents the third way of defining economic efficiency. The notion of dynamic efficiency can be traced to Joseph Schumpeter's^[3] emphasis on innovation and his argument that the perfectly competitive conditions of allocative and productive efficiency were not necessarily the most conducive to long-term innovation and economic growth. In contrast to productive efficiency and allocative efficiency, dynamic efficiency is a much less

precise concept with no universally agreed upon formal definition. In general terms, dynamic efficiency refers to the economically efficient usage of scarce resources through time, and thus, it embraces allocative and productive efficiency in an intertemporal dimension. Sometimes, the concept of dynamic efficiency is given more specific meaning in the literature. For instance, the macroeconomic debate on the optimal rate of saving, or the decision to postpone some part of current consumption to a future date, has been referred to as intertemporal efficiency. Similarly, the comparative institutions approach, often associated with New Institutional Economics, focuses on the efficiency of alternative institutional arrangements at exhausting the welfare gains attendant upon exchange relationships.^[7]

Economic Theories of Public Leadership

INTRODUCTION

The concentration of the operational authority over public organizations in the hands of chief executives (CEs) is a striking feature of the new public management (NPM) that has emerged from about two decades of public sector reform in English-speaking nations. This article is concerned with the extent to which the new-styled CEs should be expected to exercise leadership and management.

NEW PUBLIC MANAGEMENT AND ORGANIZATIONAL LEADERSHIP

Although there are variations in the way NPM has been applied in different countries, it generally moves away from a traditional, highly prescriptive, administrative framework by emphasizing the importance of “hands-on” professional management and the “freedom to manage,” the introduction of performance appraisal with explicit performance standards, and a greater use of output controls with their stress on results rather than procedures.

The restructuring required to implement these doctrines has often been radical as large bureaucratic structures have been broken up into “single-objective, trackable and manageable units”^[1] within which it is easier to match resources to defined tasks and to shift from controlling input to monitoring output. This reflects a fundamental realignment of the core administrative values that are embodied in organizational design. According to Hood,^[1] the quest to implement the doctrines of NPM may advance what he calls the “sigma-type” cluster of administrative values that highlight “economy” and “parsimony,” even where this makes it more difficult to realize “theta-type” values of “honesty” and “fairness,” and “lambda-type” values of “security” and “resilience.”

Numerous researchers have pointed out that NPM has been influenced as much by economic theories as by management theories. For example, Hood^[1] argued

that the core doctrines of NPM are derived from a “marriage of two different streams of ideas”—economics, especially new institutional economics and public choice theory, with their emphasis on contractual solutions to agency problems in the public sector, and “managerialism,” with its emphasis on a “professional management” that is “portable,” “paramount,” “discretionary,” “central,” and “indispensable.”

The compatibility of these two streams stems from the way economic contractualism seeks to depoliticize the CE’s role so that they can be “freed to manage” through the application to public organizations of “best practices” developed in the private sector. If economic theory sees the public sector as a vertical chain of principal–agent relationships, then the goal of NPM-style reforms is to delineate accountability for “outcomes,” “outputs,” and “inputs.” This process has been carried furthest in New Zealand where the State Sector Act of 1988 made Cabinet ministers accountable for “outcomes” so that they would have to contract with specific agents, including the CEs of government departments, to supply the “outputs” they deemed necessary to achieve these “outcomes.” The CEs could then be made accountable for the delivery of these outputs, but given the discretion to manage their inputs and delivery mechanisms in the manner they deemed to be most efficient. Through successive funding cuts it was hoped that these CEs would be placed under relentless pressure to save costs by restructuring their organizations.

The staff redundancies in the organizations being restructured have often been substantial. However, the costs incurred by redundant staff, in retraining for and seeking new jobs, and by the state, in providing them with income support while they are unemployed, are typically not internalized by the CEs of the restructured organizations. These officials are more likely to take into account the transaction costs involved in establishing the contractual and accounting systems designed to make them accountable for the efficiency with which they deliver specified “outputs.” To rationalize the restructuring required to implement NPM, they can draw on both economic theories and

managerialism to argue that a shift to NPM enables their organizations to potentially realize “productivity gains” with a net present value that exceeds these transactions costs.

Managerialism does, however, differ from economic theories in terms of the way it relates these productivity gains to the quality of leadership exercised by the CEs responsible for transforming public organizations according to NPM principles. Although economists have traditionally neglected the study of leadership, managerialists have been able to draw from extensive studies in management and organizational behavior that have identified leadership as having a significant impact on organizational performance, particularly during periods of discontinuous organizational change.^[2]

In surveying this literature, Bryman^[3] pointed out that there are as many definitions as there are theories of organizational leadership. This is because leadership is a multifaceted phenomenon so that the definition can often do no more than highlight the aspects of the phenomenon that the subsequent theorizing sets out to elaborate. We recognize this by advancing a definition of leadership that brings together the political and social aspects that are the subject of a range of other leadership theories. We then show how economic theory can be modified to explain the social influence aspect. We then argue, by way of conclusion, that there is a need to look beyond economics to explain the irreducibly political dimension of leadership in order to assess the contractualist view that the role of the CE should be depoliticized.

THEORIZING FROM DEFINITIONS OF LEADERSHIP

Many writers on organizational leadership seek to define this phenomenon in a way that distinguishes it from “management.” Two aspects of leadership are often highlighted. The first is reflected in the oft-quoted slogan that “management is about doing things right while leadership is about doing the right thing.” This focuses on the judgment-making aspect of leadership. To exercise leadership in these terms, a CE must make judgments that affect the direction of an organization’s development. Interpretive studies of leadership^[4] stress the political dimension of this judgment-making process. They depict leaders as making these judgments through their involvement in the multidimensional processes of social interaction through which acceptable meanings of issues, events, and actions are created and sustained.

Second, many writers conceive leadership as a distinctive type of social influence relationship. To lead

is to influence, guide, engage a following, and build their commitment to realize a particular vision. According to Tichy and Devanna,^[5] leadership involves pulling an organization into the future “by creating a positive view of what the organization can become and simultaneously providing emotional support for individuals during the transition process.”

For CEs to be said to be exercising leadership in this way, they must be striving to influence the intrinsic and not just the extrinsic motivation of actual and potential followers. As CEs, they will be in a position to exercise “reward power” by using extrinsic rewards to induce subordinates to perform the tasks they set them, or “coercive power” by administering a set of extrinsic penalties for non-compliance with their directions. They cannot be said to be exercising leadership *per se* if they choose to exercise only these forms of power. Leadership more essentially involves influencing the intrinsic motivation of followers, through processes of “internalization” when they amplify values and beliefs that are shared by both leaders and followers, and “identification” when they engage in behaviors that reinforce and strengthen the sense of personal identification and loyalty that followers place in them.

Comparative studies have often found these processes to be more advanced in private than in traditional public organizations. For example, a Canadian study by Zussman and Jabes^[6] found that the percentage of middle managers who reported that their chief executive officers provided leadership in these ways was significantly lower in public organizations than private organizations, and that the level of public service leadership falls off much more rapidly as one goes down the organization than is the case in the private sector. The implication of these studies is that the implementation of NPM may give the CEs of public organizations the opportunity to close this “leadership gap” by adopting private sector best practices.

In this article, we attempt to elaborate a definition of leadership that brings both its political and social influence aspects together. Accordingly, we propose that a CE can be said to be exercising leadership when this official makes judgments about the direction in which an organization should be moving in a way that engages the hopes of its members to a degree that induces them to strive together to move the organization in this direction. We also propose that economic theory can only make a contribution to understanding this concept of leadership if it is initially assumed that the judgment about organizational direction has already been made. This assumption can later be relaxed when we consider the implications the judgment-making process has for the politics-administration dichotomy.

THE ENACTMENT PROCESS

Once leaders have made a judgment about the direction in which they want to steer the organization, they will need to engage its members by calling them together, at all levels of the organization, to consider how they are to enact their leaders' judgment and advance their quest. This enactment process can therefore set in motion interactions that can take the form of "expression games." According to Goffman,^[7] these involve "senders" who express themselves in particular ways and "receivers" who take in and react to such expressions, forming an impression of the "senders." The expression games generated by the enactment process can give participants the opportunity to express the hope they have placed in the leader's quest.

The CEs of large public organizations will typically only be able to engage directly in such expression games in interactions that bring together actors at higher levels of the organization. These interactions can, however, serve two functions. First, they can give the CEs the opportunity to model the behavior they expect of "followers." Second, they can give other participants the opportunity to identify themselves as such followers. A "follower" in this context is someone whose hopes are aligned with those of the leader. To a varying degree, such followers can look to the leader to strengthen their hopes. The leaders can also look to those followers who leave an impression of their trustworthiness to reproduce these expression games in interactions at lower levels of the organization.

Through the reproduction of these expression games, the enactment process may be accompanied by a diffusion of leadership and a development of a following at all these levels. To understand why this may have a significant impact on the organization's culture and performance, we need to examine the motivational effect of the hopes that are evoked and influenced through this process.

AN ECONOMIC THEORY OF HOPE AND LEADERSHIP

The traditional reluctance of economists to study the social influence aspect of leadership may have been based on the perception that, in seeking to influence followers, leaders are trying to change their preferences. The study of leadership would therefore seem to be out of bounds to the majority of economists who subscribe to the convention that economic analysis should either 1) take the preferences of individuals as given and not look inside the "black box" within which they are formed and transformed; or 2) assume that they are stable and explain apparent preference

change in terms of adjustments in the shadow prices of inputs in household production functions.^[8]

However, attempts have been made by Hermalin^[9] and Casson^[10] to analyze how leaders can influence followers by inducing them to internalize the externalities of their discretionary effort decisions. Hermalin^[9] argued that situations of asymmetric information may ironically give leaders the opportunity to alleviate the weak incentives followers have to supply effort to a team when they cannot be compensated according to their individual contributions. In these situations, leadership by example may be interpreted as a signal that leaders have better information about the value of effort devoted to their common activity so that "the harder the leader works, the harder the followers work."

This model is, to some extent, complemented by an earlier one^[10] in which the effect on individual utility functions of the emotions of shame and guilt followers experience when they fail to internalize effort externalities, is susceptible to "moral manipulation" through rhetoric the leader addresses to the group as a whole. Casson went on to show how leaders can compare the net benefits of raising the intensity of moral manipulation with those associated with more intense monitoring in a group in which individuals have varying "moral sensitivities."

In our view, neither model lays an adequate foundation to explain how CEs can influence the hopes that followers place in their quest to move the organization in a particular direction. The general approach Elster^[11] recommended in his article, "The Emotions and Economic Theory," may be more helpful in this regard. Elster basically argued that economists should reject this simple cost-benefit approach to modeling the effect of the emotions on behavior in favor of one, derived from cognitive dissonance theory, that views an emotion as a particular type of action tendency engendered by antecedent beliefs and the investment of emotional energy.

This perspective may explain why the members of an organization who have focused their hopes on advancing a quest to realize a particular vision may have an action tendency to interact in a way that reinforces their beliefs and enhances their emotional energy. These hopes will be based on beliefs that the advancement of the quest is "neither impossible nor inevitable" and that it is "worthwhile" or "important" in the sense that it is worthy of pursuit in a special way incommensurable with other goals.

If one cannot hope without holding a belief in the worth and possibility of advancing the quest that is the object of hope, it would seem that to hope is to locate oneself in a "space of questions" about both these beliefs and the authenticity of one's claims to hold them. These questions may give rise to a

dissonance that can only be alleviated by engaging in interactions with actors who can both supply clearer, more articulate reasons for holding the beliefs that trigger hope and opportunities to authenticate these beliefs by striving to advance the quest in which this hope is placed. Leader–follower relationships will thus emerge in groups where one person, the leader, plays a focal role in supplying such “reasons” and “opportunities.”

The extent to which the process of enacting the judgments of a CE engages the hopes of an organization’s members may thus be gauged in terms of the way it draws leader–follower groups into a network that penetrates every level of the organization. To understand how the expression games pursued in such groups can enhance the capacity of their members to supply effort toward advancing the CE’s quest, it may be helpful to refer to Collins’^[12] theory of “Emotional Energy as the Common Denominator in Rational Social Action.”

Collins focuses on the reinforcement and strengthening of emotional energy that occurs when “interaction rituals” (IRs) pass thresholds of “boundedness” and “density.” Leader–follower expression games may pass the threshold of boundedness when they give participants the opportunity to express an observable “passion” to advance shared hopes. Where such interactions also pass the “threshold of density” such that the participants are close enough for a sufficient period of time to ensure that they can be moved by one another’s passion, the participating group’s focus of attention and common emotional mood is likely to go through a short-term cycle of increase and mutual stimulation until a point of emotional satiation is reached. The interaction will leave each participant with an “energetic afterglow” that “gradually decreases over time” so that individuals have an incentive to reinvest their emotional energy in subsequent interactions. It may therefore accumulate across IRs so that “an individual may build up a long-term fund of confidence and enthusiasm by repeated participation in successful IRs.”^[12]

The leader–follower expression GAMES that are set in motion during an enactment process may thus significantly boost the emotional energy reserves of followers throughout the organization. This concept of leadership differs from that advanced by Hermalin and Casson in that it emphasizes the influence of leadership on the capacity rather than the willingness of an organization’s members to supply effort in excess of that for which they can be monitored and compensated. As economic theories, all three concepts tend to ignore the complexities involved in the irreducibly political process of judgment making. The implications of this neglect in assessing the leadership role of CEs must be considered by way of conclusion to this article.

CONCLUSION: THE POLITICAL DIMENSION OF PUBLIC SECTOR LEADERSHIP

The process that is resolved when a CE makes a judgment about organizational development would seem to involve the type of “autonomous politics” that, according to Barber,^[13] characterizes occasions when “some *action of public* consequence becomes *necessary* and when men must thus make a *public choice* that is *reasonable* in the face of *conflict* despite the *absence of an independent ground*” (original emphasis). Moreover, to the extent that this judgment sets in motion an enactment process than transforms the culture of an organization by focusing the hopes of its members on advancing a particular quest, it would seem that there is an irreducibly political dimension to the leadership that steers this process.

This is because there are likely to be competing perspectives on the appropriate culture for a public organization and no independent grounds for judging between them. It would therefore not be reasonable for a CE to make a judgment in this regard without striving to appreciate the divergent perspectives different stakeholders bring to this issue and giving them an adequate opportunity to make case for the values, interests, and perspectives they are seeking to advance.

Significantly, the tenure of a CE may become unsustainable, particularly where they are not entitled to a renewal of fixed-term contracts, when these judgments erode their relations of trust with portfolio ministers. These relationships are likely to be based on mutual impressions of reasonableness. They are clearly more personal and less “arms length” than typical contractual relationships. The view that contractualist reforms of NPM can revive the traditional politic–administration dichotomy therefore seems to break down in the analysis of the leadership role of the CEs of public organizations. This role cannot be exercised outside a political relationship of mutual trust between these CEs and their principals. The political dimension of organizational leadership in the public sector must thus ensure it has to be collectively supplied.

Economics, Transaction Cost

Glenn A. Daley

RAND Graduate School, Santa Monica, California, U.S.A.

INTRODUCTION

Transaction cost economics (TCE) is the study of how markets and organizations are affected by the costs of creating and maintaining economic relationships, apart from the production costs of goods and services. The initial concept of TCE was formulated by Ronald H. Coase in 1937,^[1] but only developed into a distinct field of study since the early 1970s, in the works of Oliver E. Williamson^[2] and others. It has become a cornerstone of the new institutional economics. Starting with the study of transaction costs as economic phenomena, TCE has developed into a broad discipline for the study of governance in organizational and social terms, not just traditionally economic terms.^[2]

THEORY OF TCE

It is obvious that transaction costs affect economic choices. However, there is disagreement among economists about the generalizations of TCE regarding organizational and institutional effects. There are also difficulties in defining transaction costs precisely and measuring their aggregate level in a firm or in the national economy. Thus, TCE is a developing field of study; its proponents continue working to refine the theory, test it empirically, and apply it to a widening variety of economic and organizational phenomena.

In a nutshell, the theory of TCE is that firms and other organizations, as well as social institutions and modes of governance, represent various adaptations to the existence of transaction costs. Further, TCE claims that the characteristics of transactions deeply affect the types of governance used in organizations and in society. This provides insight into economic behavior that is not easily explained within the models of classical economics, showing that seemingly inefficient practices might actually perform efficiency-promoting functions in a transaction cost framework. This approach has been applied to phenomena as diverse as contracting for uncut diamonds and theater bookings,^[3] the behavior of illicit drug dealers,^[4] and even vote trading in the U.S. Congress.^[5]

In his essay, Coase asked why firms exist at all, given the classical concept that economic efficiency is best achieved through the market pricing mechanism.^[1] A firm is characterized by the fact that it suspends the market pricing mechanism for its own internal relationships, while depending on the market in its external relationships. But what advantage is gained by suspending the market pricing mechanism internally? Why are these particular relationships internalized, whereas others are kept external? The classical notion of economies of scale does not adequately answer these questions. It is conceivable that even a large-scale production technology could be adopted by a “virtual” firm consisting solely of independent contractors, using rented capital equipment, and engaging in competitive market transactions with each other on a daily basis. We almost never see this happen, though, and the question is why not?

Coase’s answer was that there are costs to using the market pricing mechanism. A firm can reduce these costs through internalization and integration, producing a certain good or service in-house rather than buying it in the market. This raises another question: If internalization reduces costs, why isn’t everything produced by one giant firm? The answer is that integration brings its own penalties, such as increased costs of coordination and supervision, various other kinds of overhead, and the loss of flexibility due to maintaining a permanent workforce instead of hiring contractors by the day. Thus, what matters is finding the level of internalization that minimizes the net of transaction, integration, and production costs. As in much of economics, the emphasis is on comparing alternative choices at the margin, the “differential” transaction costs of a particular organizational structure or mode of governance, as compared with feasible alternatives.

The field of TCE currently faces a broad agenda of empirical research, both to measure different types of transaction costs and to test specific predictions of the theory. Because it is impossible to observe the costs of an alternative not chosen, it has been difficult to quantify differential transaction costs; much of the published literature consists of case studies rather than quantitative studies. But there is an increasing body of quantitative studies with fruitful results.

One such study by Masten, Meehan, and Snyder^[6] showed that organization costs represented about 14% of total costs for the acquisition of components by a naval shipbuilder, that internalization of the work currently performed by subcontractors would increase internal organization costs by about 70%, and subcontracting work currently performed internally would result in market organization costs almost triple the current costs. This suggests that the firm has found an optimal level of internalization. This study also confirmed that variations in the cost and governance characteristics of transactions were associated with the level of internalization of those transactions. The researchers found that integration decisions were motivated more by their effects on internal organization costs than by their effects on market mechanism costs. This empirical result supports a broader view of TCE as including not only direct market costs, but also all costs associated with alternative modes of organization.

WHAT ARE TRANSACTION COSTS, AND WHY DO THEY OCCUR?

The classical microeconomic model focuses on production costs—the capital, labor, and raw materials that go into creating goods and providing services. In contrast, transaction costs include the costs of locating and evaluating goods, buyers, and sellers; the costs of negotiating and making contracts; and the costs of monitoring and enforcing the terms of contracts over time. The idea of a transaction cost is easily seen in examples such as brokerage and banking fees, sales commissions, and the expense of hiring attorneys to review contracts. However, the concept also includes costs incurred in the process of creating and maintaining alternative arrangements for the governance of transactions.

Whereas classical economics treats management costs as a high-level labor input to production, TCE treats management and other integration costs as the costs of internal transactions. Integration costs (i.e., internal transaction costs) are distinct from the more obvious category of market-related transaction costs, and attempts have been made to measure them independently. But both categories must be considered. Internal transaction costs, including management, are substitutes for market costs; in other words, they are the costs of choosing integration rather than the market pricing mechanism as a mode for organizing economic activities. Thus, transaction costs are any costs that arise from the need to create and govern economic relationships between parties, whether they result directly from transactions or indirectly from the type of structure adopted to govern transactions.

Bounded Rationality and Opportunism

In the classical model, a transaction is a simple event. Both buyer and seller know everything they need to know. The choice of trading partners is based on price alone, but because competition forces the price to be the same for everyone, all sellers are interchangeable, and all buyers are interchangeable. Every good is purchased in separate transactions, with no bundling or tying together of goods. There are no linkages between transactions across time; tomorrow's purchase depends only on tomorrow's price and not on the terms of today's transaction. Both parties can specify exactly what they want from the exchange, and observe instantly whether it is satisfied. The transaction is concluded as money and goods change hands, so there is no need for enforcement after the fact. Due to all these features, the transaction is frictionless and costless.

These assumptions are clearly unrealistic for numerous reasons, but transaction cost economists emphasize two key problems. First is the fact that people are limited in their ability to know and control every detail necessary to achieve their intended outcomes. Where the classical model assumes human rationality, the new approach assumes only *bounded rationality*, a term introduced by Herbert Simon^[7] to indicate human fallibility in the context of rational intentions. Many transactions result in unsatisfactory outcomes because the parties cannot predict the future, know all the relevant facts, and control every detail; knowing this, buyers expect vendors to provide customer service departments, warranties, and return policies.

The second problem is that people tend to take advantage of situations for their own benefit, especially any ambiguity in the terms of an agreement or any lack of observation by the other parties to an agreement. This tendency is called *opportunism*. It includes fraud, deception, and misconduct, but it also includes the many subtle ways that people find to manipulate transactions for their own self-interest. An example is an employment relationship where employees are tempted to shirk responsibilities whenever a supervisor is not looking and an employer is tempted to pressure employees to work additional hours without claiming overtime.

These problems have been addressed to some extent by accommodating new assumptions into the classical model, leading to what is called the neoclassical model. For instance, instead of assuming that the buyer knows what is being purchased and receives it without risk, we say that the buyer has expectations about the utility to be received and adjusts demand in light of the risk. The new model also accommodates asymmetric information, where one of the parties cannot observe all relevant information about the good.

Examples include quality in the case of a complex good such as a used car, performance in the case of a service such as auto repair, and responsible behavior in the case of insured risks such as driving safety. Problems such as these are labeled *adverse selection*—the effect of unobserved information on market choices prior to the transaction—or *moral hazard*—the effect of unobservability on behavior after the transaction.

The neoclassical approach emphasizes structuring the terms of a transaction in advance so as to obtain the best expected return considering these risks. In employment and other performance contracts, the approach of structuring incentives to motivate the optimal response from other parties is called the *principal-agent* model. For example, an employment contract may include both a fixed wage and a variable bonus contingent upon the output of a work team; the bonus places part of the risk of non-performance on the employee, and thus creates an incentive not to shirk.

According to TCE, these elements of the neoclassical approach still do not solve many aspects of the problems of bounded rationality and opportunism, and inadequately describe the ways in which people adapt to these problems in the real world. Asymmetric information models address some but not all the difficulties of *observing* the performance of a contract. However, they do not address the difficulty of *specifying* the performance of a contract. Many economic relationships, such as construction contracts, depend on highly complex and uncertain plans for the future. In other cases, such as personal services, the expected outcome may be a highly subjective experience. In such cases, it may not be possible—or affordable—for a buyer to specify in perfect detail what would constitute the expected outcome of the transaction.

Incomplete Contracts

A contract that specifies every possible detail of its fulfillment and how that fulfillment will be recognized, so that there is no room for opportunism or unanticipated error, is called a *complete* contract. All other contracts are *incomplete*. It is obvious that we seldom do business using complete contracts. The purchase of a simple object that can be inspected at the time of the sale, perhaps an apple or a greeting card, is based on an unwritten complete contract. But where there are hidden qualities, even in something as simple as a bottle of soda or an article of clothing, we rely not on the completeness of contracts but on other aspects of the relationship. We consider such factors as our familiarity with the vendor, our recognition of a commercial brand, and our trust in the truth of labels. Even a lengthy contract for a major industrial project cannot

specify every eventuality; rather, it specifies a *process* for resolving unspecified issues during the life of the contract. In TCE, such dispute resolution processes, truth-in-labeling regulations, commercial brands, and ongoing vendor relationships are recognized as substitutes for complete contracts.

Contracts become even more complex and costly when they are connected to other transactions. This is clear when different goods must interact, such as computer hardware and software; critical elements of one contract may depend on the fulfillment of other contracts with different parties, multiplying the consequences of bounded rationality and opportunism. There is also interconnectedness in multiple transactions with the same partner. When a transaction is repeated many times, uncertainty is reduced and the contract becomes a matter of mutual understanding, making it costly to switch vendors even to obtain a lower price. The terms of contracts may be modified on the basis of expectations about later transactions, while the terms of subsequent contracts may be altered due to previous experiences, so that a transaction becomes part of a pattern of favors granted or withheld over time. Thus, the transacted price of a good or service can deviate considerably from the market price.

Asset Specificity

Another characteristic of transactions, closely related to the above characteristics of complexity and repetition, is called *asset specificity*. It describes the degree to which a good, service, vendor, or employee cannot be interchanged with other goods, services, vendors, or employees. At one level of specificity, semiconductor fabricating equipment cannot be interchanged with metalworking machine tools; at an even higher level, the dies used in manufacturing a firm's proprietary product cannot be exchanged with dies from other firms. With regard to employment contracts, an accountant cannot be interchanged with a mechanic. An accountant with many years of experience in a firm has knowledge that cannot be replaced even by hiring another accountant from outside. Furthermore, the accountant with such inside knowledge is more valuable to this particular employer than he or she would be to a different employer.

Clearly, the higher the degree of asset specificity, the greater the mutual dependence between the parties to a transaction. In such a dependent relationship, one or both of the parties would lose value by switching partners, and thus has an incentive to maintain the relationship. Because people are forward looking and rational, but aware of bounded rationality and opportunism, they will form contracts to balance the potential

cost of losing such relationships with the ongoing costs of maintaining the relationships. Both of these costs are high where asset specificity is high; both are low where asset specificity is low. Thus, the employment contract for a high-level systems engineer with knowledge of proprietary technologies involves higher transaction costs, and more complex organizational arrangements, than the contract for a janitor.

GOVERNANCE AND ORGANIZATIONS

As a result of bounded rationality and opportunism, we generally recognize that we cannot depend on commitments others make or expect others to depend on commitments we make. There are social settings where a person's word is taken as a dependable bond, but closer study reveals that members of such communities depend on cultural norms or institutions and their ongoing relationships with each other to guarantee these commitments. People use diverse and creative methods to establish the credibility of commitments in advance, perhaps by making visible, irreversible investments or by setting up structural impediments to opportunistic mind changing. These methods often involve behavior that does not fit well into a competitive market model. Identifying such non-market guarantees of commitments in our society is one of the major contributions of TCE and new institutional economics.

The neoclassical approach focuses on the incentives and uncertainties in the contract itself, and emphasizes the design of the contract prior to its adoption. It assumes that people attempt to solve the problems of uncertainty and motivation in the terms of the contract. However, even under carefully structured incentives, there will be incomplete contracts and windows for opportunism. The neoclassical model assumes that contracts are well specified and can be enforced in courts of law. Where even this remedy breaks down and the parties cannot find a way to make satisfactory enforceable contracts, there must be some kind of market failure. There will be no agreement and thus no market; or there will be an agreement with externalities in which some part of the burden of non-compliance falls on parties without their consent, and thus not captured within the agreed-upon price.

However, the TCE model acknowledges the incompleteness of contracts, placing them in the context of ongoing economic relationships. Thus, in addition to the incentive structure of the contract, it examines the nature of the ongoing relationship and describes how the contract is governed over time. Clearly, resolving conflicts through the courts is expensive, and most of the time we use less costly arrangements or institutions, such as personal negotiation, mediation, and

arbitration. Within a community of individuals or interacting organizations, much governance can be carried out through social influence, reputation effects, and informal rewards and punishments. Within a firm, governance of internal transactions can be carried out through direct supervision with explicit power to reward and punish.

In fact, one of the defining characteristics of a firm is the degree of control it has over its assets and its employees.^[8] This control is largely free from oversight by the legal system, much more so than in the case of external market transactions. This brings us back to Coase's initial question about the existence of firms. Now we can say that firms provide a structure for governance that is an alternative to the market system and the legal system. Internalization occurs when the total of transaction costs, including integration costs, governance costs, and the potential costs of unfulfilled contracts, can be reduced by bringing transactions inside the firm's control.

Although it focuses on the transaction, TCE provides a powerful tool for the analysis of organizations. A firm is not just a contract, it is a long-term organizational structure for making and governing contracts, one of the many types of arrangement available. In contrast to the principal-agent approach that focuses on designing a contract to optimize its expected outcomes, the TCE approach shows that the very choice of the organizational structure in which contracts are embedded is an adaptation to the incompleteness of contracts. This adaptation can be understood as optimizing the expected net of transaction costs, integration costs, governance costs, and the costs of unfulfilled contracts over a long-term sequence of many transactions.

Such adaptations are not limited to the polar extremes of hierarchical firm versus competitive market. Many large firms are not strictly hierarchical in practice; the study of management control systems provides insights into the practical task of governing transactions within firms to obtain the motivational advantages of market competition and incentives without losing the cooperative and transaction cost advantages of hierarchical organization.^[9] There is a broad range of hybrid types of governance combining various elements of hierarchical integration and competitive market pricing. Claude Menard^[10] outlined how labor arrangements in organizations may vary between quasimarkets and direct hierarchies, with other forms in between, depending on the nature of the transactions, especially their uncertainty and asset specificity.

In addition, different types of adaptation occur at different stages in the same contract. Before a long-term contract is awarded, the process of obtaining competitive bids is essentially a market process; at that stage, the bidders are more or less interchangeable, and

asset specificity has not yet become a concern. Where there are enough bidders and enough opportunities for them to compete, the price for the contract as a package will be determined by a market pricing mechanism. In what is called the *fundamental transformation*, the situation changes after the contract is awarded, and the winning bidder establishes an asset-specific long-term relationship requiring non-market forms of governance. This transformation clearly happens with large industrial contracts, and to a lesser extent when employees are hired. But transactions such as commodity purchases that lack the characteristics of uncertainty, complexity, and asset specificity do not go through the transformation; they remain governed by the market pricing mechanism and conform more closely to the standard economic models.

PUBLIC ADMINISTRATION AND PUBLIC POLICY IMPLICATIONS

Efficiency in Government

Transaction cost economics suggests that government agencies, as well as firms, are significantly molded by transaction cost effects. Government agencies can be viewed as governance arrangements for public goods transactions, an especially necessary type of governance because of the high incentives for opportunism, called “free riding” in this context. Public sector governance is also affected by asset specificity; many of the human skills and physical assets employed by government could not be interchanged with private sector skills and assets without some loss of value. In public administration, the creative use of marketlike incentives where appropriate can help to make agencies more efficient, but these must be tempered by awareness of the TCE reasons that markets do not work for all types of transactions.

In an era of government reform, devolution, and downsizing, it pays to study how outsourcing and governance decisions are made in the private sector. Major changes in the structure and practices of government organizations inevitably bring about changes in transaction costs. Identifying these costs, and comparing them between existing arrangements and alternative proposals, can make an important contribution to the evaluation of reorganization plans.

Efficiency in Markets

In classical and neoclassical welfare economics, a competitive market equilibrium is regarded as the gold standard of economic efficiency. In this view, any organizational arrangements, social institutions, or

economic practices that interfere with or fall short of such an outcome must to that extent be inefficient. For example, the traditional view of antitrust policy has been that unfamiliar or non-standard business practices must be anticompetitive in intent or effect, and thus inefficient. However, TCE has shown in theory and in several empirical studies of utility markets^[10] that surprising and unusual forms of business relationships, hard to account for with standard economic models, can often be explained and justified as efficiency-promoting adaptations to transaction costs and the need for governance of complex long-term relationships. Where this is true, prohibiting such practices through antitrust regulation might increase costs to the consumer, not the effect intended by the regulators.

The theoretical and empirical task of applying TCE to various contexts is unfinished. But the antitrust example indicates that at least some apparent market failures are actually adaptations to transaction costs. This suggests that policy makers should consider the economic functions served by existing institutions and relationships, which can then be taken into account in proposing or evaluating government interventions that might alter transaction cost structures.

However, government investments in public goods and externalities that reduce everyone’s transaction costs may contribute more to the general welfare than interventions in such apparent market failures. Transactions take place in the context of a society’s legal system, its information infrastructure, and its regulatory and tax burdens on business firms. Thus, policies that might increase transaction efficiency across the board include dispute resolution alternatives in the legal system, improved communication and access to information through technology such as the Internet, simplifications of reporting requirements for businesses, programs to retrain workers displaced by economic and technological change that makes their specific skills unneeded. In general, this approach suggests that consumer and business policies should—wherever possible—reduce rather than increase the uncertainty of transactions, and increase rather than reduce the flexibility of parties to govern their own contracts.

INTRODUCTION

Education policy includes the world of elementary and secondary, postsecondary, and early childhood education. It involves measures ranging from organization of traditional schooling to the setting of college tuition to the provision of programs intended to help nurture preschoolers. In this sense, education policy is the public policy area in which American government is most heavily invested. In 2001, all levels of government—federal, state, and local—spent well in excess of \$647 billion on educational provision. Approximately 60% of this amount is devoted to providing K–12 schooling, which serves 33.5 million children, while the remaining 40% of these funds are used to support college and university programs.

During the late 1990s and through 2002, the American public consistently listed education as one of its top two or three national concerns. This marked a sharp break with the nation's past, as schooling (and, by extension, education policy) had traditionally lagged near the bottom of the public's policy concerns. Education began to gain increased attention in the mid-1980s, and it began to move up the list of prominent public concerns during the late 1980s and early 1990s.

EDUCATION POLICY

The substance and shape of U.S. education policy has shifted radically over the course of the nation's history. Government involvement in educational provision was haphazard until the late nineteenth century, and systematic public provision of both K–12 schooling and higher education only took on their contemporary form during the first half of the twentieth century. Before that time, schooling remained primarily a locally funded and locally governed service that rarely attracted significant policy attention. Schools were only standardized at the state level, as sustained federal involvement in higher education did not begin until after World War II and did not begin in K–12

or preschool education until the launch of the Great Society programs in the mid-1960s. In fact, the U.S. Department of Education was not created until 1979. Given the scope and largely decentralized nature of public schooling, affecting change is often difficult. This is especially evident in light of the fact that the United States currently has over 15,000 local school districts and 50 state boards of education that coordinate their efforts with the Department of Education.

Brief History of Education Policy

From the nation's founding, education occupied a central place in the imagination of America's leaders. Founders like Benjamin Rush and Thomas Jefferson championed the importance of an educated citizenry, calling for a system of public schools and the creation of state-supported higher education. Throughout the colonial period and the early nineteenth century, however, education policy consisted of little more than the state supplying land for school houses and a small amount of money to support the operation of grammar schools.

The first important move toward what can more conventionally be understood as “education policy” was Horace Mann's crusade as President of the Massachusetts Board of Education (1837–1849) to reform the state's schools, enhance the caliber of teachers, and increase the level of instruction. Much of the support for Mann's effort, and for similar efforts elsewhere, was inspired by a desire to “Americanize” the new waves of immigrants populating the United States at that time. In fits and starts, such efforts proceeded across the nation in the latter half of the nineteenth century, as state after state adopted compulsory education programs that required children to attend at least some grammar school. Between 1890 and 1940, these measures were developed into an ongoing commitment to nearly universal education. The population of students attending school and graduating from the K–12 system grew at a dramatic rate, partially propelled by state provisions for compulsory attendance. Although the first such law was

passed in 1853, it was not until the turn of the century that an overwhelming majority of states had enacted such legislation.

During this time period, the federal government slowly began to increase its involvement in education policy. This began in 1862, when Congress passed the Morrill Act, a provision that earmarked land to support the construction of public universities across the nation. The act marked the first time the federal government sought to involve itself directly in schooling or education. At the K–12 level, the first significant federal efforts would not occur until 1917, when Congress provided fiscal incentives for vocational education in the form of the Smith–Hughes Act.

Different Forms of Education Policy

Education policy serves a broad range of student needs, encompassing much of a broader role outside traditional K–12 schooling and higher education. In the twentieth century, the federal government began to further address the needs of discrete populations by implementing new programs. Those detailed have been among the most popular and widely cited examples of such interventionism.

Early childhood

The federal government made its first foray into preschool education by establishing the Head Start program for disadvantaged preschool children under the Economic Opportunity Act of 1964. Aimed initially only at poor children, its purpose was to organize programs that would prepare preschool children for elementary school. Money was appropriated through the Office of Economic Opportunity, which made individual grants to cities and other localities to set up Head Start centers. In 1969, the program was transferred to the Department of Health and Human Services. It was later extended to children above the poverty level, whose parents, however, had to pay according to their income.

Special education

It was not until the late 1960s that education policy addressed the equalization of student opportunity throughout the United States. A new concern for persons with disabilities was addressed by the Johnson administration. The watershed in the development of these programs was the federal government's landmark legislation in 1975, entitled the Education for All Handicapped Children Act (EAHCA), which was incorporated into a new law, the Individuals with Disabilities Education Act (IDEA) of 1990. In 1997,

Congress reauthorized and amended IDEA, expanding the purpose of the law to emphasize outcome measures for preparing disabled children for employment and independent living rather than that of merely requiring access to public education.

Changing Governmental Role in Education Policy

The federal government initially served a distributory, rather than a regulatory, role in the American educational system. From the early nineteenth century, Congress issued state land grants to provide for common schools. In conjunction with the federal requirement that all states draft a constitution, this was the only role the federal government played in the establishment and administration of state-run school systems.

Education occupied a prominent place in state constitutions, yet schools were largely locally run. Many voters were distrustful of strong, centralized authority during the nineteenth century and resisted moves toward further state control. Throughout this era, educators sought to replace haphazard standards of teacher training and certification, supervision, and curriculum by consolidating school districts and extending state authority over public education. These efforts led primarily to symbolic efforts that were not standardized throughout the state educational system.

However, with the advent of the Progressive era in the early 1900s, greater standardization was achieved. School leaders used state laws to bureaucratize and centralize public schools. This push for change relied heavily on professional expertise rather than lay participation in decision making. Educators and their allies contended that a modern system of education demanded increased consolidation, standardization, and centralization. In light of this, state legislators enacted such changes in spite of public preference for a more locally run educational system. At this time, schools became more heavily bureaucratized, with state-mandated provisions for curriculum, teacher status, administrative organization, and consolidation.

Shift to centrally dictated outcomes, but increased operational freedom

One of the central reforms in education policy throughout the 1990s was a standards movement, which was implemented as states and school districts sought to enhance student achievement. Although earlier reform movements were characterized by either a “top-down” (i.e., mandates) or “bottom-up” (i.e., local control) approach, standards-based reform combines both approaches to enable states and districts to

define the focus and expectations for educational outcomes and to hold educators accountable for meeting these aims. This paradigm involves both a set of clearly defined student performance goals for schools to strive toward (usually content standards), and an accountability system that provides a set of incentives for schools or districts to achieve the standards and accompanying penalties for failing to move toward them (rewards and sanctions). Yet, it also provides districts and schools with greater autonomy to make decisions that they believe will improve instruction and student outcomes. Policy makers recognize that instructional improvement needs to be motivated and developed at the school and classroom level, and they are developing ways to give schools and teachers increased autonomy to make decisions that affect student learning.

New Trends in Education Policy

Accountability

Since the 1990s, a growing number of states have created comprehensive accountability systems designed to increase student learning in public schools. These accountability systems are based on “high-stakes” standardized testing of a state curriculum. Local educators face consequences based on how well their students do on these exams. They receive rewards for good student performance and are subject to interventions to rescue children from low-performing schools. This shift toward comprehensive accountability systems includes set goals for student achievement, specific outcome measures for these goals, incentives for educators who yield good student outcomes, and interventions for students who may be underperforming in so-called failing schools.

State policy makers have been reluctant to extend a great deal of flexibility to districts, and are increasing using high-stakes testing to measure student outcome and guide curricular decisions. States for many years have been accumulating testing requirements that their legislatures, state officials, or local administrators have chosen. As these outcome measures continue to be widely used in a growing number of states, assessment has been inextricably aligned with the centralized testing of student achievement with standardized instruments. Student performance goals were made more explicit so that testing could be more precisely focused, and efforts were made to align curricula with the testing.

School choice

As accountability measures are increasingly being used to determine how well public schools are serving

students, the issue of providing parents with options to ensure enhanced achievement has also taken flight. During the 1990s, school choice has become a pervasive topic in education policy, as over two-thirds of state legislatures passed provisions allowing the establishment of charter schools.

In 1994, federal charter school legislation was passed that exempts these institutions from state and local regulations that inhibit flexible management, yet provides that these schools be guided by public control. A charter school possesses much greater autonomy than a traditional public school. Charter schools are free from many district, state, and union regulations or requirements, including those governing curriculum, teaching methods, contracting for services and facilities, and the hiring of personnel. In exchange, charter schools are held accountable for student performance. Yet, although charter schools have moved to a national forum as a form of school reform, this movement has developed in different ways and at varying rates at the state and local level. The federal government has had only a limited role in the development of charter schools, leaving state charter legislation broad and varied. Such measures may constrain who is eligible to obtain a charter, how many such schools may operate, and to what measures of accountability these schools will be responsible.

A less widely implemented and more ardently contested method of school choice has been the proposed use of vouchers to allow parents to more actively guide their children's education and provide more options to those who could otherwise not afford private schooling. This means of school choice involves encouraging open competition within the school system so that schools are held directly accountable for meeting students' needs. Proponents argue that giving parents a tax credit and allowing them to use it to dictate their child's school of choice allows both schools the opportunity to change to attract students, and parents and students the opportunity to decide what educational opportunity best suits their needs. Voucher plans range from public plans, which would allow students to attend schools according to either inter- or intradistrict regulations to private plans, which would allow students to attend private or parochial schools.

Home schooling

A trend antithetical to the historical growth of compulsory schooling for all children has grown increasingly prominent. In the latter part of the 1990s, state legislatures increasingly amended state compulsory attendance laws to permit home schooling. Regulations on attendance, curriculum, and other requirements vary from state to state, as home schooling became

increasingly popular in the first years of the twenty-first century. The Department of Education estimated in 2001 that over 500,000 students were currently home schooled in the United States.

Tuition support/HOPE scholarship

The 1997 Taxpayer Relief Act provided two major provisions, which make pursuing higher education less financially burdensome, the Hope Scholarship Credit and the Lifetime Learning Credit. The Hope Scholarship Credit allows taxpayers to claim up to \$1500 per student for each of the first 2 years of study at an approved institution of higher learning. The Lifetime Learning Credit applies to those who are beyond the first 2 years of higher education or pursuing part-time enrichment to improve or upgrade their job skills. This provision provides families with a 20% tax credit for the first \$5000 of tuition and fees through 2002, and for the first \$10,000 thereafter.

CONCLUSION

The field of education policy has become a much more varied, contested process. New initiatives prove to play out differently among various states, as the government attempts to better serve the educational needs of

children in the United States. The current direction appears to be toward enhanced accountability for certain outcomes, while retaining a greater degree of choices for parents and students. The system of public education has grown from a provincial, non-mandated institution to a wide-ranging system that nearly every American experiences on a multitude of levels throughout their lives.

Education, State Administration of Primary and Secondary

Thomas C. Sutton

Department of Political Science, Baldwin-Wallace College, Berea, Ohio, U.S.A.

INTRODUCTION

The administration of primary and secondary public education in the United States is conducted primarily by state governments in conjunction with local school districts. All states with the exception of Hawaii employ the structure of local school districts as the direct administrators of public primary and secondary education. Local administration of public schools dates back to the seventeenth-century New England colonies, where communities would collect a property tax for the purpose of hiring a “tutor” to teach the children of the village and surrounding farms. The importance of public education has been emphasized by states since the Declaration of Independence, evidenced by the inclusion in all 50 state constitutions of a clause stipulating that the state government is responsible for ensuring the provision of a system of public education. The constitutional provision for each state established the legal responsibility of state governments for ensuring the effective administration of public education, either directly or through local school districts.^[1]

State involvement in public education has grown significantly during the twentieth century, driven in part by public calls for improvements to public education. With education being viewed as a key element of both civic engagement in a democratic society and as the basis for skill training necessary for gainful employment in a rapidly changing economy, American society has made many demands on school districts. New policy developments and mandates such as integration, the development of special education services for students with physical and learning disabilities, vocational education, improving curriculum and facilities, and increasing teacher preparedness have been developed usually as initiatives of state legislatures and administered through state departments and boards of education.

STATE AND LOCAL ADMINISTRATIVE STRUCTURES

Although local school districts usually predate the formation of states and state constitutions, they are considered to be legal extensions of state authority.

State administration of primary and secondary public education (herein referred to as public education) begins with the granting of charters allowing the formation of geographic units as school districts. School district boundaries conform with either county or municipal boundaries. School district residents elected representatives to a board of education, which is responsible for oversight of all administrative concerns of the district, including financial management, personnel, facilities, curriculum, and student conduct. School boards range in number from 3 to as many as 15 members who serve on a voluntary basis (some large municipal districts provide a small stipend) and are usually elected at large. Boards of education hire a superintendent who acts as the primary administrator of the district, and who in turn is responsible for hiring building principals; teachers; service staff, such as custodians, bus drivers, and secretaries; and supporting administrative staff to handle district finances, curriculum, and personnel issues.^[2]

Paralleling the local district model, states created boards of education responsible for the oversight of public education. State boards range from elected members representing state districts and at large seats to entities appointed by governors and legislators, to mixed boards of elected and appointed members. State boards oversee a state superintendent of public instruction who may be appointed by the board and/or the governor, or may be elected. The state superintendent directs a state department of education that is responsible for administering all state public education mandates, policies, and finances. Occasionally, such departments will have authority for a specific program removed due to concerns of accountability by legislators. An example of this is Ohio, which began a significant program of state funding for local school facility construction and repair in 1997, with the creation of a separate School Facilities Commission that reported directly to the governor and the state legislature.^[3]

Despite the somewhat unique structure within state government, it is often the governor rather than the board of education and/or superintendent who is the most prominent advocate for public education, especially in periods of reform. Governors of southern states took the lead in the 1980s, seeking to improve teacher compensation and training and school curriculum in the wake of the 1983 “Nation at Risk” report

issued by the National Commission on Excellence in Education. A second effort at reform was led by the National Governors Association in 1991, with its issuance of "Goals 2000," a set of benchmarks for student achievement and preparedness endorsed by President Bush as the blueprint for national policy priorities in public education.^[4]

At times, other statewide offices are involved in public education administration. State auditors may become involved through periodic examination of school district finances and intervention in districts with systems that are weak or in crisis. State attorneys general have often served as the lead defense counsel for states that have been sued for issues ranging from integration to provision of special education programs to school finance inequities. Secretaries of State oversee implementation of local elections and levy votes through county election boards, while lieutenant governors are often given responsibility for oversight of special education initiatives related to safety, such as reducing school violence and services for juvenile delinquents.

State legislatures play an important role in public education administration through their growing involvement in policy development and evaluation. State legislatures have passed statutes stipulating exact credit and course distribution requirements for high school diplomas; required degrees, coursework, internships, and testing for teachers and administrators; and mandatory proficiency testing as a graduation requirement, along with the formulas for state aid to local school districts. The activist role of governors and state legislatures is an important reason why state school boards and departments of education have been relegated to largely passive roles as implementers of policy.

SCHOOL FUNDING

School districts are funded through two primary sources: property taxes and state aid. Historically, property taxes served as the primary source of income for districts. Currently, the percentage of funding from property taxes ranges from 40% in Michigan and Kentucky to 70% in New Hampshire, Wyoming, and Vermont.^[5] Property taxes are levied as millage, which is a unit equaling one-tenth of one cent on each dollar of assessed property value. States allow a minimum of between 10 and 20 mills to be levied by districts without voter approval. Additional millage requires voter approval and is usually for a specific period of time, requiring periodic renewal votes. The rapid rise of property values in the 1970s led to a property tax revolt by voters exemplified by California's Proposition 13, which froze property taxes and required voters to approve all new increases, including changes to adjust for inflation. As a result, districts in states such as

California, New York, and Ohio frequently have new tax levies on the ballot that are necessary to pay for cost increases due to inflation rather than for improvements to the district's educational capacity.^[6]

States use various funding formulas to supplement local property taxes. The most common is the foundation aid formula, which attempts to guarantee a minimum per-pupil spending level for every district, adjusted for variations in local cost-of-doing-business factors. A few states use a foundation grant program, which provides flat grant amounts of varying levels determined by the size and property wealth of a district, as opposed to attempting to establish a minimum spending floor for every student.^[7]

The basis of funding in property taxation inevitably results in fiscal disparities between districts with low and high tax capacity and property wealth. These disparities have persisted despite growing levels of state aid, with districts in some states having as wide as a \$10,000 difference in spending per pupil between the poorest and richest public school districts. As a result, school districts began suing states in state courts, alleging that such disparities violated state constitutional guarantees of accessible public education. In 1973, the *San Antonio v. Rodriguez* case was appealed to the U.S. Supreme Court, seeking a ruling on whether funding disparities violated the due process and equal protection clauses of the Fourteenth Amendment. The court ruled that public education is not a guaranteed right under the U.S. Constitution, sending such cases back to state courts. Since the San Antonio decision, 38 states have experienced school finance litigation, with 23 state supreme courts ruling systems of school funding to be in violation of state constitutional provisions for accessible public education.^[8] Cases in some states have dragged on for years through multiple appeals and rehearings.

Urban school districts face special funding challenges. Higher poverty rates produce low residential property values as well as a higher percentage of students with special social and educational needs, incurring higher costs than suburban districts. Added to these factors are the higher costs of urban areas, the presence of strong teacher and service worker unions that drive up wage levels, all compounded by the endemic inefficiency of large administrative bureaucracies that are part and parcel of large urban districts.^[2] A few of the school funding litigation cases have specifically focused on the needs of urban districts, in particular, the New Jersey case of *Abbott v. Burke* (1985).^[9]

CURRICULUM AND PERSONNEL

States are responsible for setting standards for school district curriculum, teacher, and administrator

certification, and are often also involved in oversight of facilities. Curriculum is determined by state standards that mandate a set number of courses in each discipline at the secondary school level necessary to obtain a high school diploma. Primary school curriculum is usually measured by student achievement benchmarks for each grade, such as achieving literacy by fourth grade and arithmetic proficiency by fifth grade. Secondary level (grades 7–12) course credit is measured in Carnegie Units, which are determined by the number of minutes a course meets each week during the four quarters of a school term. States also set the number of days schools must meet each academic year, usually ranging from 175 to 200 days. Districts in many states determine start and end dates, as well as holiday schedules. States will allow a set number of cancelled days, beyond which days a district is closed must be made up by extending the school year or shortening vacation periods (a particularly nagging problem for northern state districts with frequent snowstorms).

States also administer certification for teachers and school administrators. Teachers are required to have a minimum of a Bachelor's degree in education, combined with field-specific coursework in the disciplines the teacher will be using in their career. Most states have shifted from permanent certification to certificates for periods of between 5 and 10 years, requiring teachers to achieve additional professional development to obtain continued certification. Professional development usually takes the form of graduate-level coursework. When combined with district pay schedules that pay incentives to earn graduate degrees, the result is that a majority of career teachers now hold Master's degrees in education. Administrators are usually drawn from teacher ranks. They are also required to earn a Master's degree or graduate certificate in education administration before becoming administrators. Education subfield degree specializations include special education, reading instruction, gifted and talented education, vocational education, counseling, curriculum development, and management.^[2]

Personnel issues include an impending shortage of teachers and administrators. High job stress, lower compensation than in other fields with equivalent educational requirements, and negative public perceptions of public education have contributed to the shortage, and are issues requiring response in order to effectively recruit and retain future teachers and administrators.

STUDENT ACCESSIBILITY AND SERVICES

Public schools are much more accessible than ever before. In 1954, the *Brown v. Board of Education* decision ushered in 30 years of desegregation orders applied to local school districts throughout the United

States. Although desegregation successfully tore down the system of separate and unequal schools within school districts, the success of tactics such as busing, mandatory student assignments to buildings, and magnet schools is mixed. Demographics of urban districts changed rapidly, leading to the situation in most urban areas of poorer urban districts with a majority of minority students surrounded by predominantly white, middle-class, suburban districts. As a result, providing strong public education to students who need it most continues to be a major challenge, compounded by the reflected demographic changes in state legislatures, which are less interested in spending more tax dollars on failing schools with fewer constituents.

Federal funding tied to mandates for provision of special education combined with the Americans with Disabilities Act of 1991 constitutes a mandate to states and local districts to provide special education to all eligible students. Such services are expensive, and are often not adequately funded by state and federal dollars. States usually operate a formula aid program that sends funding to local districts based on how many students require special education services. School district resources have been stretched in recent years by implementation of the philosophy of “mainstreaming,” which requires that special needs students receive services while attending regular classes with non-special needs students, rather than being taught in separate, specialized classrooms.

ISSUES OF ACCOUNTABILITY

Since the early 1990s, schools and teachers have been under increasing scrutiny over issues of accountability. State legislatures have responded by requiring proficiency testing at various levels of primary and secondary education. Many states require passing a high school proficiency test, usually taken in the ninth or tenth grade, to earn a high school diploma. A major concern has arisen over the social promotion of students who fail to achieve grade-level skill development, but are advanced with their age peers. States are experimenting with proficiency tests in the primary grades to measure literacy and math skill attainment. Students who fail these tests receive extra instruction or summer school, or may be held back until passing the tests.

Proficiency testing has been controversial. Proponents see testing as a way of uniformly measuring and guaranteeing minimum standards for student achievement, thus avoiding the stories of illiterate high school graduates. Opponents argue that proficiency testing limits curriculum, with teachers focusing on “teaching to the test.” Others are concerned that proficiency tests disproportionately affect minority students in

urban districts. President George W. Bush included proficiency testing at every grade level through tenth grade as a major component of his education reform package. The Bush plan is to provide incentives and support to help schools with low test passage rates to improve, but to remove the funding if a school district fails to show improvement after 3 years.

Critics of failing urban school districts advocate the use of vouchers and charter schools as ways to introduce competition into public education. Proponents believe that public schools will improve if faced with losing students and funding to private schools. Vouchers are public dollars given to poor families to use to pay for private school tuition. Voucher programs have been in place since the late 1990s in Milwaukee, Wisconsin; Cleveland, Ohio; and Florida.^[10] The use of public dollars to fund education at religious schools prompted a legal challenge under the First Amendment. The Cleveland voucher program will be heard by the U.S. Supreme Court during the 2001–2002 term. Charter schools are private schools chartered by the state for specialized education that are often exempted from regulations governing school districts, to encourage innovative curricula and teaching. Rather than paying for individual tuition at private schools, states subsidize the expenses of the entire charter school. Although appealing as a form of school choice, charter school evaluations in Ohio and other states have shown mixed results in terms of improving student achievement.

Efficiency

Hwang-Sun Kang

Department of Urban Management, Seoul Development Institute,
Seoul, Republic of Korea

INTRODUCTION

This article introduces the concept of efficiency and discusses the validity of the concept being used as the primary criterion of performance measurement in the public sector. From Wilson, the father of public administration in 1887 to Osborne and Gaebler, advocates of reinventing government in 1992, efficiency has been said to be the first ideology of public administration. Wilson pinpointed the role of government: government should be able to implement delegated tasks from the legislature. Efficiency is defined as the ratio of outputs to inputs. It describes the cost of resources used for an activity to achieve given outputs. This entry shows how the formula applies to prevalent management techniques such as cost–benefit analysis and data envelopment analysis. This entry introduces an argument related with efficiency. When a public policy is analyzed based on the ideology of efficiency, it is questionable if government performance could be measured by the definition of efficiency. Although the definition emphasizes final outputs of government activity, many scholars hold that it is extremely difficult to measure the final facet of government activities. It is neither desirable nor reasonable to measure government performance based on economic (monetary) efficiency. This article holds that there are two kinds of efficiency: technical efficiency and social efficiency. When government performance is evaluated based on the rationale of efficiency, those two concepts should be considered.

DEFINITION OF EFFICIENCY

From Wilson, the father of public administration in 1887, to Osborne and Gaebler, advocates of reinventing government in 1992, efficiency has been said to be the first ideology of public administration. Wilson pinpoints the role of government: government should be able to implement delegated tasks from the legislature. A motto of reinventing government: “Cost Less and Work Better,” also represents the underlying idea of the definition of efficiency.

Efficiency is defined as the ratio of outputs to input. It describes the cost of resources used for an activity to

achieve given outputs. Here, it should be noted that the numerator of the formula of efficiency should be the final outputs of government activity. For instance, “caseload per worker” is not an efficiency measure, because caseloads are not outputs.^[1]

Fig. 1 describes the definition of efficiency and its relationship with effectiveness. Ammons^[2] illustrated some examples of efficiency measures, indicating the difference from other related definitions (Table 1).

MANAGEMENT TOOLS BASED ON EFFICIENCY

Although the basic logic of efficiency is simple, it is the ultimate idea of many management techniques used in the public sector. Cost–benefit analysis that is one of the most traditional techniques of public-policy analysis is based on the simple formula of efficiency. Activity-based management skill imported from the private management arena is also using efficiency as its basic logic.

Another powerful skill newly emerging in the public sector, data envelopment analysis (DEA), adopts efficiency as its basic logic. Interestingly, DEA introduces a new term related to efficiency: relative efficiency. The DEA determines a non-parametric best practice frontier and then measures efficiency relative to that frontier. Thus, DEA is also called “frontier analysis.” DEA method does not use any statistical inferences, rather, it is a mathematical programming technique developed by the operational research arena focusing on business firms and not-for-profit organizations to find a best practice unit among multiple units (decision-making units). DEA has many advantages:^[3]

- DEA can handle multiple input and multiple output models.

Fig. 1 Relationship between efficiency and effectiveness.

Table 1 Examples of four representative measures of government performance

Municipal function	Workload measure	Efficiency measures	Effectiveness measures	Productivity measures
City clerk	Number of sets of city council meeting minutes prepared	Employee hours per set of city council minutes prepared	Percentage of city council minutes approved without amendment	Percentage of city council minutes prepared within 7 days of the meeting and approved without amendment
Library	Total circulation	Circulation per library employee	Circulation per capita	Circulation per 1000
Meter repair	Number of meters repaired	Cost per meter repair	Percentage of repaired meters still functioning properly 6 months later	Cost per properly repaired meter (i.e., total cost of all meter repairs within 6 months)
Personnel	Job application received	Cost per job application processed; cost per vacancy filled	Percentage of new hires and promotions successfully completing probation and performing satisfactorily 6 months later	Cost per vacancy filled successfully (i.e., employee performing satisfactorily 6 months later)

Source: From Ref.^[2].

- It does not require an assumption of a functional form relating inputs to outputs.
- Decision-making units are directly compared against a peer or combination of peers.
- Inputs and outputs can have different units. For example, X1 could be in units of lives saved and X2 could be in units of dollars without requiring an a priori trade-off between the two.

ARGUMENT RELATED TO EFFICIENCY

There is an argument related with efficiency. When a public policy is analyzed based on the ideology of efficiency, it is questionable if government performance could be measured by the definition of efficiency. Although the definition emphasizes final outputs of government activity, many scholars hold that it is extremely difficult to measure the final facet of government activities. Especially, it is neither desirable nor reasonable to measure government performance based on economic (monetary) efficiency.

Considering this argument, it is necessary to expand the definition of efficiency. There are two kinds of efficiency in the social science arena: technical efficiency and social efficiency.

Technical efficiency refers to the general meaning of efficiency that indicates the rates of inputs to outputs. In contrast, social efficiency discusses not only economic (monetary) efficiency but also social relevance of a government activity. Even if a government activity is implemented efficiently economically, the government activity should be interpreted on whether it is compatible with social needs (social ideology or social relevance).

E-Government in East Asia

Hee Joon Song

*Department of Public Administration, Ewha Womans University,
Seoul, Korea*

INTRODUCTION

The East Asian countries, including China, Japan, and Korea, have experienced different modernization processes, which evolved into the diverse political and economic systems today. There exists not only the economic gap between the developed and least-developed countries, but also the political gap between the liberal democratic countries and the socialist dictatorship in the East Asia. Such disparities in political and economic systems cause the differences in objectives, expected outcomes, project contents, and development strategies of the e-government among the East Asian countries.

CHINA

The national informatization (xinxihua) has been regarded by political leaders, such as Deng Xiaoping and Jiang Zemin, as the key tool to facilitate the economic development since 1980s. In 1993, the State Council launched 17 Golden Projects, aiming to develop the IT industries and improve the efficiency of ministries. The projects included 1) the Golden Customs, an integrated data system to link trading companies, banks, and customs; 2) the Golden Bridge, the national network for economic information; and 3) the Golden Card, the unified payment clearance systems.^[1] In January 1999, the State Economic and Trade Commission with the China Telecom initiated the Government Online Project (GOP), in order to interconnect the 40 central ministries, all provinces, autonomous regions, and municipalities.^[2] The GOP aimed to make information on the government policies available on-line for the public to access and to promote the government's image. It also targeted to gradually digitalize internal processes and services of ministries and to build their websites. The Enterprise Online Project (www.sinoeol.com) started in 2000, in order to facilitate B2B and B2C e-transactions. Meanwhile, the Households Online (www.sinohome.com), which initiated soon afterward, focused on establishing household networks. Implementing the 10th and the 11th Five Year Plan from 2001 to 2010, China seeks to significantly reduce the digital gap between China and other developed countries and to rebuild the country

with strong IT power, which would enable "the whole Shaokang Society," where everybody enjoys a wealthy life.

One of the recent outcomes of the above projects has been the launching of an official website of the Central People's Government of the People's Republic of China (www.gov.cn), which opened in January 2006. This website, available both in English and in Chinese, consists of four sections—China Fact File, Services, Business, and China Today—that provide information on the structure, function and key persons of the central government, services for citizens, businesses and foreigners, a variety of search engines, and the communication channel between the government and people. Many local governments, including big cities such as Shanghai, Shenzhen, and Quindao, also have established e-government infrastructures and networks. An example that reflects the successfully implemented e-government projects is the Shanghai city website (www.shanghai.gov.cn), which allows citizens to access 703 government-run businesses and to download 2400 forms of public services. Moreover, the Zhongguancun Business E-Park (www.zhongguancun.com.cn) pursues interactivity, efficiency, and transparency of public service.^[3]

Although the e-government in China has been carried out as a part of the Five Year Plans for economic development, with enthusiastic supports of the political leaders, the front office services has not reached the stage of consolidating the cross-agency business processes yet. Furthermore, it is important to note that Chinese perspective toward the participatory, open e-government, especially that affects the policy-making process, is rather dissenting. While the Chinese government utilizes the Internet as a driving engine to facilitate economic development, the country contradictorily recognizes the technology as a factor that should be monitored and tampered, in order to prevent the democratic participation of citizens that might challenge the regime.^[4]

JAPAN

In 1993, Japan's Cabinet proposed a plan to promote the cross-ministerial informatization, the use of administrative information, the improvement of

public services to citizens, and the innovation of administrative processes. In 1994, the government also developed the New Social Capital Plan to enhance the quality of the high-speed network, to create the early market demand on the high-speed network as a leading user, and to give financial supports to the private sector to reduce its investment burden. The Basic Plan for the Informatization of the Administration (1995–1999) prioritizes in establishing the cross-ministerial information sharing by implementing the network, the e-mail and e-document exchange system, the system to support the national council, the DB system of the white papers and research reports, and the system to search for the location of administrative information. The Basic Plan was extended in 1998 to “the Electronic Government Towards the 21st Century (1998–2000),” which included the on-line publishing of information on the location of administrative information, the provision of on-line public services such as e-application and e-filing, the digitalization of internal processes and documents, and the information and database sharing on-line. While pursuing the informatization of the administration, the ministries developed the systems to manage their internal processes and specific tasks and provided the integrated service connecting the central and local government.

E-Japan Strategy, developed to build the global IT leading country in 2000, included the plans for establishing the network that would enable people to access the Internet any time at a low price, thus improving the e-commerce system and market regulation. This, in turn, would realize the e-government and enhance the human resource development at the same time. In particular, the Japanese e-government replaced the hard-copied document with electronic information, making computerized public services like e-application and e-filing available. The paperless administration also allowed information sharing through the network. E-Japan Strategy II was developed in 2003, aiming to build the convenient society, where people enjoy sound and secure lives and share new satisfaction. It planned 1) to apply IT to seven areas—medical service, food, living, finance for small-and medium-sized enterprises, learning, working, and public service—in order to improve their efficiency and 2) to create the ubiquitous network environment required for the utilization of the next-generation IT. Both strategies contributed to Japan’s success in developing and utilizing the global top-level high-speed Internet infrastructures, lowering the telecommunication prices, distributing multifunctional mobile phones, and improving e-commerce environments.

Finally, in January 2006, Japan set up an agenda, “New IT Reform Strategy: Realizing Ubiquitous and Universal Network Society Where Everyone Can

Enjoy the Benefits of IT” (www.kantei.go.jp) and has pursued the e-government action plan (2006–2010). The plan includes more than 50% increase in the use rate of on-line services, the promotion of e-government services, the reduction of expenditure and service-processing time, and the optimization of cross-ministerial processes (www.e-gov.go.jp/doc/scheme.html).

Overall, Japan did not lead the world in e-government in 1990s, in spite of its high economic and technological capability. While the country successfully digitized the internal process of the central and local governments and promoted on-line publishing and utilization of administrative information, it failed to realize the integration of cross-ministerial work and e-participation and interaction between the government and the citizens. As Japan has steadily expanded the range of on-line services available to its citizens and businesses in 2000s, it is expected to develop the top-level e-government within a short period, having outstanding IT capacity.^[5]

KOREA

The e-government has been the core of various master plans on national informatization since 1980s. The development of Korean e-government can be largely classified into three steps according to its target, content, and characteristics changes that reflect different political leaderships, information technologies, work types to be automated, linkage with governmental innovation, and legal and institutional frameworks.^[6]

Step I (1987–1995) focused on improving the delivery and production of public services, increasing the convenience of people and strengthening the national competitiveness, as it targeted to realize a small but strong government through national informatization. To achieve these goals, the Korean government carried out the first and the second National Basic Computer Network Project (NBCN). The first NBCN (1987–1991) focused on building five basic national databases on administration, finance, education and research, national defense, and public security. During the second NBCN (1992–1995), eight databases on prioritized tasks—national welfare, post offices, procurement, freightage, fishing boats, land registration maps, intellectual property rights, and weather information—were developed.

During step II (1996–2000), the government targeted to realize a small and efficient government, while innovating public service to citizens and promoting the sharing and disclosure of government information within the framework of the first National Informatization Promotion Master Plan. The Korea Information Infrastructure (KII), which started in 1995 and completed in 2005, made it possible to provide

high-speed Internet service to all schools across the country from 1997. The KII also made the front-office services such as procurement, patent administration, customs, national taxation, and railroad services available to individuals and companies on-line. During this period, social actors such as universities and mass media trumpeted the social campaign "Let's lead the world in information society, although we have been late in industrial revolution," contributing to improve national awareness on informatization.

The vision of the Korean e-government in step III (2001–2007) is "to leap to global leading country in 21st century," by improving public services to citizens and businesses, enhancing transparency and productivity of the administration, and realizing people's participation. In addition, the Presidential E-Government Special Committee was established to derive ministerial coordination and cooperation for the cross-ministerial e-government projects.

Step III covers the last 2 yr of the Kim Dae-jung administration (2001–2002) and the whole period of the Roh Moo-hyun administration (2003–2007). Eleven e-government projects were implemented during the Kim administration, enabling cross-ministerial connection. During the Roh administration, 31 e-government projects were implemented and would be completed by the end of 2007, with the goals of innovating business practices, improving customer services and information resource management, and reforming laws and regulations. In short, the e-government of step III can be characterized with 1) the development of government-wide architecture to support cross-ministerial consolidation and linkage of information systems; 2) the establishment of participatory e-governance allowing people's participation in policy-making process; and 3) the complementation and improvement of the existing projects.^[7]

The evolution of Korean e-government reflects the typical development stages of e-government. The internal administration became more efficient and productive at the first stage. The second stage makes the public service user friendly. Finally, the third stage realizes the democratic governance that ensures interactive participation.

CONCLUSION

As information technologies advance and government processes change, e-government continuously evolves. The model of the Organization for Economic Cooperation and Development explains this evolution with three development levels: one-way information provision; two-way consultation; and active participation in policy making. United Nation's web presence

measurement model shows five development levels of e-government: from emerging to enhanced; to interactive; to transactional; and to networked presence. Both models measure the maturity level of e-government with technology advancement and the extension of interactive participation of people.^[8]

According to UN model, East Asian countries show outstanding achievement. Korea went up from 15th to fourth among 191 UN member countries, Japan from 27th to 14th, and China from 93rd to 57th between 2002 and 2005.^[9] Korea is already considered as the global top in e-government readiness, and Japan is almost catching up. Although currently positioned among middle-ranking countries, e-government in China is also rapidly developing.

East Asian countries share several characteristics as well. Firstly, the strong political will and leadership on e-government are critical to success. Both Korean and Chinese leaders pursued e-government as one of presidential agenda, considering it as a lever for economic development and administrative innovation. Secondly, e-government, accompanied by the government-wide business process reengineering beyond the simple automation of the existing agency-centric process, improves the transparency and efficiency of the administration. Chinese President Jiang Zemin stressed in 2002 the administrative reform through e-government, and Korea established the e-Government Special Committee under the Presidential Committee on Government Innovation to tightly link e-government with government innovation. Thirdly, e-government is expected to lead the development of participatory e-governance, as its objective evolves from the delivery of public service to the active participation of people in policy-making process. However, regarding the use of the Internet, Korea, Japan, and China hold different positions. Japan and Korea consider the Internet as a useful means to facilitate participatory governance as well as administrative transparency and accountability. On the other hand, China regards it negative, and even as a challenge to the regime.

Lastly, e-government agenda of these countries include the issue of bridging digital divide in society. Without overcoming discrepancy among social classes in the access to the Internet, e-government services cannot be delivered to the citizens.

Electric Industry Restructuring

John D. Wong

Stacey M. Brewer

*Hugo Wall School of Urban and Public Affairs, Wichita State University,
Wichita, Kansas, U.S.A.*

INTRODUCTION

Prior to the 20th century, electricity was primarily an unregulated industry in the U.S.A., largely owned by private entities. These privately owned utilities provided for the generation, transmission, and distribution of electricity.^[1] The early structure of the electric utility industry was predicated on the concept that a natural monopoly was an efficient, low-cost means of generating, transmitting, and distributing electricity. Because monopolies in the U.S.A. were outlawed, regulation of the utilities became the rule. Federal and State government regulations were developed to control operating procedures, prices, and entry into the industry to protect consumers from potential monopolistic abuses.^[2]

However, the electricity industry has undergone considerable changes in the last two decades. Major industry restructuring has separated the once vertically integrated electric utilities into distinct entities. To facilitate competition at the wholesale level, the Federal Energy Regulatory Commission (FERC) has required transmission-owning utilities to “unbundle” their transmission and power marketing functions and provide non-discriminatory, open access to their transmission systems by other utilities and independent power producers. At the retail level, some states have required utilities to divest their generation assets as part of restructuring. In addition, power marketers—who often do not own generation, transmission, or distribution facilities—buy and sell power on wholesale markets and market electricity directly to customers.^[3]

Several factors have caused this structure to shift to a more competitive marketplace. First, technological advances have altered the economics of power production. Second, rate increases caused primarily by increases in utility construction and fuel costs prompted many to question the efficiency of the existing regulatory environment. Third, the emergence of nonutility power producers demonstrated that traditional vertically integrated electric utilities were not the only source of reliable power.^[2]

THE FEDERAL POWER ACT OF 1935

Much of the present structure of federal electric utility regulation dates back to the Federal Power Act of

1935. The act granted the Federal Power Commission (FPC) authority to regulate wholesale power sales that were made by investor-owned utilities (IOUs). Before this legislation, interstate transactions could not be regulated. The FPC was given a broad authority in matters in which state regulation was found ineffective or unconstitutional. The FPC was authorized to promote interconnections between utilities under its jurisdiction or between a jurisdictional utility and other entities in wholesale electricity transactions.

When the Federal Power Act was established, the issue of mandatory or unrestricted wheeling was raised. At that time, the Congress chose to narrowly define the act. The act allowed the Federal Power Commission to order interconnections or energy sales only on the application of a state commission or utility and only where such action would not jeopardize service to existing customers or force the expansion of a utility's generation or transmission capacity. Mandatory wheeling, or the use of the transmission facilities of one party to transmit the power of another, per se, was prohibited, except during emergency situations, when the FPC could order temporary interconnections, sales, or transmission of energy.

After the establishment of the Public Utility Act of 1935, the electric utility industry stabilized. Electricity prices declined, demand expanded, capacity and reserves were adequate while the industry received a stable level of profits. Because of this stability, federal regulation was limited.

In 1962, the FPC reorganized the Bureau of Power to strengthen its regulation of wholesale electricity markets and to improve the efficiency of the power industry. The FPC's jurisdiction covered the wholesaling of electricity by any utility that is interconnected to utilities in other states. As a result, practically every wholesale electricity transaction came under the jurisdiction of the FPC and its successor, the Federal Energy Regulatory Commission, created in 1977.

THE PUBLIC UTILITY REGULATORY POLICIES ACT OF 1978

A turning point in the evolution of federal regulation of electric power was the Public Utility Regulatory

Policies Act of 1978 (PURPA). Prior to PURPA, the new wholesale power producer could not sell directly to retail customers because it did not have a state retail franchise, nor wholesale power could be delivered to wholesale power purchasers because local retail utility companies owned and thus controlled local connecting power transmission lines. After it came into force, PURPA amended the FPA and gave the FERC power to order transmission service when certain specific conditions are met. Under PURPA, mandatory wheeling may be ordered by FERC after: 1) a complaint has been filed by another utility, after; 2) notice and an opportunity for a hearing, and upon; 3) the determination of a number of factors including:

- That the request has been made of the utility that sells power for resale and it is either unwilling or unable to provide the transmission service.
- That the requested order conserves energy, promotes the efficient use of resources, or improves reliability.
- That the power to be transmitted will not replace power presently provided to the recipient by the transmitting utility.
- That the proposed transaction will reasonably preserve existing competitive relationships among the utilities involved.
- That the order will not result in any “reasonably ascertainable uncompensated economic loss” by any of the involved utilities.

Although PURPA provided explicit “wheeling authority,” severe limitations were placed on its use. It was incomplete because transmission was limited to local distribution and that distant transmission of wholesale power was open only through voluntary agreement. Federal Energy Regulatory Commission did not have wheeling authority to force a transmission access to wholesale distributors. The restrictions placed on such sales limited the full capabilities of the wholesale power generation market.

THE ENERGY POLICY ACT OF 1992

The rationale underlying wheeling is that by opening up transmission access to wholesale power distribution, power companies will be able to operate more efficiently. By purchasing wholesale power, the retail electric companies will be able to limit capital investments necessitated by having to build additional generating capacity to meet peak load demands. According to this argument, electricity prices will decrease because of increased efficiency, and stranded investment costs will be reduced. As such, Congress enacted the Energy Policy Act of 1992 (EPAct), which expanded

the Federal Energy Regulatory Commission’s authority to order vertically integrated utilities to allow non-utility power producers access to the transmission grid to sell power in an open market. Although the law specifically prohibits FERC from ordering retail wheeling and the transmission of power to a final customer, the law amended the wholesale transmission provisions of the Federal Power Act to allow a nationwide open-access electric power transmission grid for wholesale transactions. Independent power producers, publicly owned utilities, rural cooperatives, and industrial producers gained the ability to seek from FERC orders that require transmission-owning utilities to provide transmission service at FERC-defined “just and reasonable” rates. The language of the law concerning pricing directs FERC, when it issues a transmission order, to approve rates which permit the utility to recover “all legitimate, verifiable economic costs incurred in connection with the transmission services.” Such costs include “an appropriate share, if any, [of] necessary associated services, including, but not limited to, an appropriate share of any enlargement of transmission facilities.” The language also says that FERC “shall ensure, to the extent practicable,” that costs incurred by the wheeling utility are recovered from the transmission customer rather than “from a transmitting utility’s existing wholesale, retail, and transmission customers.”^[2]

However, FERC’s authority to order access was implemented on a case-by-case basis and proved to be slow and cumbersome. To remedy that, in 1996, FERC issued Order 888 requiring all vertically integrated investor-owned utilities to file an open-access transmission tariff that would provide universal access to the transmission grid to all qualified users.^[2] The order requires all public utilities that own, control, or operate facilities used for transmitting electric energy in interstate commerce to:

- File open-access nondiscriminatory transmission tariffs containing minimum terms and conditions.
- Take transmission service (including ancillary services) for their own new wholesale sales and purchases of electricity under open-access tariffs.
- Develop and maintain a same-time information system that will give existing and potential users the same access to transmission information that the public utility enjoys.
- Separate the transmission from generating and marketing functions and communications.^[4]

Order 888 was an important stimulus in the development and strengthening of competitive wholesale power markets, but discriminatory practices regarding access to the transmission grid still remained, and a more effective effort was needed. In December 1999,

FERC issued Order 2000 calling for the creation of regional transmission organizations (RTOs), independent entities that will control and operate the transmission grid free of any discriminatory practices. Electric utilities are required to submit proposals to form RTOs from October 2000 to January 2001.^[2]

Another equally important component of Order 888 was the requirement for transmission owners to functionally unbundle their activities. Functional unbundling required the transmission owner to take transmission service under the same tariff as other transmission users, to separate rates for wholesale generation, transmission, and ancillary services, and to rely on the same electronic information network that its transmission customers rely on to obtain information about prices and available capacity of the transmission system.^[2]

The second goal of Order 888 was to ensure that electric utilities are able to recover their sunk costs in a competitive industry. These sunk costs are called stranded costs, or transition costs, and they represent a utility's capital investments that are unrecoverable because of the transition to competition. The rationale for allowing stranded cost recovery is that utilities have invested billions of dollars in facilities under a regulatory regime that allowed cost recovery of all prudent investments. To gain support and cooperation for a successful transition to a competitive industry, and to be consistent with the past decisions, FERC believed

it was critical that utilities recover these costs. At the same time, FERC recognized that recovery of stranded costs may delay some of the benefits of competitive power markets.^[2]

Order 888 of FERC spelled out under what general conditions a utility is entitled to recover its stranded costs and from whom. Order 888 specified that cost recovery at the wholesale level is limited to situations where there is a link between the use of FERC's required open-access transmission tariff and the loss of wholesale power customers. Then FERC went further to specify that recovery of wholesale stranded costs should be assigned to the departing customer. At the retail level, FERC determined that states should have primary jurisdiction over cost recovery resulting from retail competition, although it would entertain requests to recover costs resulting from retail competition when a state does not have the authority.^[2]

Whether the EPAct ultimately results in an efficient competitive wholesale electric power market depends in large part on how FERC and state regulators interpret and implement its provisions. Although one of the objectives of the EPAct is to facilitate equal access to transmission services for all wholesale generators at equitable rates, the economic leverage of transmitting utilities remains. The EPAct also amends PURPA to require states to decide whether it is appropriate and consistent with state law to conduct "general evaluations" of major issues before allowing or mandating

Fig. 1 The status of state electric restructuring as of February 2003.

utilities to enter into long-term wholesale power agreements. Notwithstanding, although the Energy Policy Act does prohibit FERC from ordering retail wheeling, it is under consideration in many states. In Fig. 1 the status of state electric restructuring as of February 2003 is shown.

ELECTRIC UTILITY OPERATION IN RETAIL WHEELING ENVIRONMENT

In a retail wheeling environment, electric utilities can serve customers at any location and utility customers are free to purchase their electric energy from any electric energy supplier, which may not even be an electric utility company in the traditional sense. There will be interchanges of electric energy through the grid just as before; however, now instead of the interchanges between different electric utilities there will be interchanges between different electric energy suppliers and their customers, thus producing the term retail wheeling. This makes the operation of the grid much more difficult.

The wheeling transaction is a matter of precise coordination among the seller, the wheeler, and the purchaser. The seller overgenerates electricity in the amount the purchasing utility has agreed to buy. The purchasing utility then undergenerates the same amount at the same time as the seller. The wheeler allows its transmission lines to be used. This process allows a specific amount of power to flow from the seller to the purchaser over the lines of the wheeler during a specified period.

The transaction involves only the transmission facilities of the wheeler. The generation facilities of the wheeler are not involved in any way. The main responsibility of the wheeler is to make sure that its lines are able to carry the exchanged amount of power without becoming overloaded or overheated, causing damage to its systems or power outages.

In the traditional operating environment, individual electric utilities had total control of their transmission and distribution network and only had to be concerned about the adequacy and reliability of their grid to serve their own customers. However, in a retail wheeling environment many different electric power suppliers, from both inside and outside the state, will be trying to transmit electric energy through the grid to their specific customers located anywhere in the state. In addition, some electric power suppliers in the state will be sending power through the grid to new customers outside the state and there will probably be some power flowing through the state from power suppliers outside the state to customers outside the state. The grid will change from a private conduit with access controlled and monitored by each utility in their own service territory, to a public thoroughfare (or common carrier) where theoretically, at least, any electric energy supplier

has the right to use the grid and inject electric energy for extraction by the particular customers that have decided to purchase electric energy from this supplier. Thus, in a retail wheeling environment the number of transactions between energy suppliers and energy consumers will increase, because any supplier can sell to any customer and any customer can buy from any supplier. There will also no longer be any geographic restrictions placed on customers and suppliers.

As all electric transmission and distribution lines carry a designed maximum amount of power, the issue of who will operate the grid in a retail wheeling environment is an important technical issue. In a retail wheeling environment, the grid operator will serve as a gatekeeper to ensure that as many transactions between electric energy suppliers and their customers as are desired can take place, without in some way overloading a particular line or portion of the grid and thus endangering the reliability of the electric grid system in general. When overloaded, transmission and distribution lines can fail because of heating. When one line fails, the load is taken up by the other lines in the grid. However, if some remaining lines are already near their maximum capacity, they too can become overloaded and fail if they are forced to carry the additional power from a failed line. This can lead to a cascading failure that, if unchecked, could destroy the entire grid system.

A second key technical issue associated with retail wheeling relates to the first issue and involves the development of some criteria by which individual energy suppliers will be allowed access to the grid in the likely event that portions of the grid are operating at maximum capacity and no additional energy transactions can take place without jeopardizing the operation of the overall grid system.

A third technical issue involves the fact that it will be difficult to plan and design new lines in the future because it will be difficult to predict the number of electric energy suppliers and customers that will want to inject and/or extract electric energy into or from this future line. There is also the related question of who pays for the new lines.

Many traditional electric utilities are not likely to survive in a fully evolved retail wheeling environment. While, traditionally, electric utilities have been involved in all three aspects of the production of electric power—generation, transmission, and distribution—electric utilities in a competitive environment are likely to focus operations on a single aspect of the production process. Utilities that have an abundance of new, efficient generating plants are likely to divest themselves of their transmission and distribution systems, and their traditional geographical customer base, and devote themselves totally to the generation of power (generation companies or “gencos”) for the wholesale market.

Similarly, utilities with efficient transmission systems, particularly those covering a wide geographic area, are likely to focus on the transmission of power (transmission companies or “transcos”) from wholesalers to retail distributors. These entities would operate parts of the transmission system within a discrete region as either a common carrier or an open-access contract carrier. A common carrier provides transmission service on a non-discriminatory basis to all those seeking its services within the limits of its capacity. This carrier would not actually own the electricity flowing through its lines, but would simply provide the transmission service for a fee. An open-access contract carrier would commit its transmission capacity, possibly on a long-term basis, by means of contractual agreements. Alternatively, the contract carrier could buy power at one location and sell power at another, thereby acting as a kind of broker for delivered electricity. The transmission company would serve as a bridge between producers and their customers. These transmission companies would operate the grid and ensure its reliability by limiting access and restricting the amount of energy injected into the grid if it was determined that portions of the grid were operating at maximum or near maximum capacity. These companies would also plan, design, and build new power lines as the grid requirements increased. However, because the transmission company has the potential to exercise substantial monopoly power, regulation of access and rates might be necessary to avoid unnecessary duplication of facilities, and to prevent chaos in interconnections.

Distribution companies or “discos” would result where utility companies have decided to focus their business activity on the sale and distribution of power to retail customers. Under this arrangement, consumers would receive two bills. One of these bills would be from the local distribution company and would be a fixed amount each month for access. This would represent the charge for having the lines and electric meter connected to the customer’s site. The second bill would be from the particular electric energy supplier the customer had selected as the source of his/her electric energy. Presumably, this bill would include not only the cost of the energy but also any charges added by the transmission company.

CONCLUSIONS

In a competitive environment, the traditional regulatory compact of an exclusive service territory in exchange for non-discriminatory service to all customers upon demand must yield to a set of transactions that are subject to change, based on price, quality, service, attractiveness, or any combination of reasons. The telecommunications, transportation, and natural

gas industries have undergone deregulation. Customers now have many choices, as do the suppliers who can tailor their strategies to meet their desired market. Competitive electricity markets are clearly in the early stages of development. While restructuring efforts have broadened electricity markets and increased the number of market participants, the extent to which expected benefits have been achieved is uncertain.^[5] The aftermath of the California electricity crisis in 2000^[1,6–9] and the August 14, 2003, electricity blackout in eight northeastern and midwestern U.S. states^[10,11] underpin ongoing uncertainties concerning the efficacy of the restructuring of the electric power industry. However, it is likely that the economic deregulation or restructuring of the electric industry will continue.

Electronic Government

Mary Maureen Brown

*Department of Political Science, University of North Carolina at Charlotte,
Charlotte, North Carolina, U.S.A.*

INTRODUCTION

Electronic government (e-gov) refers to government's use of technology, particularly web-based Internet applications, to enhance the access to, and delivery of, government services to citizens, business partners, employees, and other government entities. Electronic government activities focus on three forms of interactions: Government to Citizen, Government to Business, and Government to Government. Within each of these interaction domains, four types of activities typically take place. The simplest type of activity is to provide information over the Internet. Under this scenario, public agencies employ the Internet to distribute information such as school closing notices, public hearing schedules, issue briefs, or regulatory notifications. The second type of activity allows two-way communications between the agency and the citizen, a business, or another government agency. These web pages allow users to engage in dialog with agencies—users can post queries, comments, or requests to the agency, regardless of time of day or day of week. Gaining in complexity, the third form of activity that takes place over the Internet involves conducting transactions. Some governments have begun to port transaction-based services to the web, allowing users the opportunity to access agency services 24 hours a day, 7 days a week. Some of the more common transaction-based activities include:

Procurement	Interagency payments	Employee leave requests
Joint tax filing	Vehicle registration	Worker's compensation
File business taxes	Apply for licenses	Birth/death certificates
Marriage licenses	Divorce decrees	Criminal background checks
Request license plates	Register to vote	School enrollment
Pet licensing	Change of address forms	Electronic fund transfers
Travel expense reimbursement vouchers		

The final form of activity that takes place over the web centers on governance. Online polling, voting, and campaigning are just some of the ways governments are attempting to increase citizen involvement in the political process.

Despite the noted benefits, the implementation and maintenance of online service delivery efforts can encounter formidable challenges. The deployment of web-based services requires an extraordinarily complex combination of technical, organizational, economic, human, and political factors. Some of the areas that dominate discussions pertaining to digital government include better methods of information technology management, models for electronic public service transactions and delivery systems, and avenues for citizen participation in democratic processes. Other topics such as secure and controlled access to timely, accurate, and authoritative public records are central to any web-based initiative. Data quality, willingness to share data across organization boundaries, and threats to privacy and security all serve to stymie digital government benefits.

TECHNOLOGICAL COMPONENTS

Governments connect to the Internet by establishing services with an Internet service provider (ISP). The citizen then accesses the government web site via their ISP subscription. Citizens gain access to all the online services a government might provide on these servers via a single entry screen known as a "portal." A portal is a "single face" where citizens can conduct "one-stop shopping" for their government needs. Portals allow organizations to aggregate and share content—information, services, and applications with customers, partners, employees, and suppliers. Portals are often organized by topic area rather than bureaucratic function and often incorporate various levels of government. For example, in the "my vehicle" section, citizens may find all information pertaining to vehicles—from driver's licensing, to vehicle registration, to traffic citations. In designing a portal, attention should be given to content, presentation, density, and color schemes. Above all, web sites should be easy to navigate and users

should not have to follow more than three links to find the information for which they are looking.

Software Applications

As mentioned earlier, governments employ online services in four ways: 1) to disseminate information; 2) to promote communication; 3) to conduct transactions; and 4) to facilitate governance. A standard design includes a firewall server, a web server, a transaction server, and a database server. Depending on how they choose to employ online services, the following applications may be needed to establish online government services.

1. Electronic payment systems allow the government agency to collect fees and levy taxes for services such as business licensing, vehicle registration, or refuse collection. Electronic payment systems differ in their approach to how they collect fees. Some software systems allow credit card transactions, some electronic checking, and others provide a digital cash approach. Initiatives are also underway to allow tax payers to pay for services via automated teller machine accounts. When deciding which payment scheme (or schemes as the case might be) to employ, careful consideration must be given to confidentiality, integrity, and authentication issues.
2. Commerce server software provides numerous features pertaining to product information, shopping carts, shopper information, order initialization, shipping charges, taxes, payments, and receipts. Commerce server software allows citizens to easily conduct one or more transactions in one visit. This software tracks the transactions and provides a final summary and checkout process for the citizen.
3. Web server software allows citizens to request information and serves up the pages as requested. The server software controls the storage and retrieval of documents and their transfer; it is also responsible for encryption and authentication. Moreover, the software will have incorporated communication programs that allow it to communicate over the Internet. The software packages range in price according to functionality. The software should be simple to configure, as well as easy to administer and manage on a daily basis. Performance is critically important. The software must be capable of receiving hundreds of thousands of transactions per day.
4. Web browser software allows citizens to connect with servers to access any number of web pages, and to follow links from document to document or page to page. Browser software acts as a link between the user and the Internet or online service. The browser will contact the online service and send a request for information or for a web page. The browser then receives the information, usually in the form of a page, and displays it on the user's computer. Browsers often include plug-ins, which are software programs that are needed to display images, hear sounds, or run animation sequences.
5. Transaction server software is often referred to as online transaction processing (OLTP) software. Its basic duty is to process data according to the rules established by an organization. It passes requests from the web server on to the database server. The transaction server confirms orders, sends a request for payment, and captures payment information. It also takes responsibility for adding, deleting, and modifying orders. The transaction server runs the programs that tell the database server how to handle the data. Because OLTP systems are designed for high volume, the underlying data will change on a minute-by-minute basis. Online transaction processing software captures the day-to-day e-government operations by capturing data about basic business processes and events. Many users concurrently access the database to insert, retrieve, update, and delete individual records. Data are stored in operational databases to meet these transactions. This software is designed for a high volume of small transactions. The focus of these systems is on performing reliably under heavy transaction loads. These systems support day-to-day operations, and are designed to be performance sensitive and to work well under repetitive routine transactions. Because they are not designed for analytical purposes, they do not generate decision-based information well.
6. Firewall server software controls the flow of traffic between two or more networks. The firewall is usually placed between the government network and an external network such as the Internet or a partner's network. Firewalls monitor access to and from specific networks. These systems can protect against viruses, intrusions, and other unauthorized system access.

Hardware Solutions

Internet-based solutions are built on the client/server concept. The client/server concept incorporates a number of computer devices that "serve" or "host"

or “operate” an installed software application. For the most part, each server will “host” only one application. The hosting of only one application per server allows activities on the other servers to continue while one is taken out of service for maintenance or repair. Hence, loss of services is kept to a minimum with the client/server model. In short, depending on the type and number of online services the agency will be providing and the number of citizens that will be accessing the services, a separate computer server will probably be required for each of the fore-mentioned software applications.

For the most part, computer servers only differ in three major ways. They differ in their processing speed, their storage capacities, and the speed of their data input–output transporting mechanisms. In determining the hardware requirements for designing the servers, the following issues should be carefully considered:

- *Performance*: The ability to perform numerous operations or to handle a large workload without requiring extensive modifications.
- *High reliability*: The ability to run without a non-recoverable failure for long periods of time.
- *Service/support*: Maintainability and ease-of-use considerations, such as the ability to remove and replace a component (e.g., fan, disk drive, power supply) without having to shut down the system or cause processing functions to stop.
- *Storage*: The storage capacity, both in terms of raw space (i.e., how many gigabytes) and the number of disk drives a server can support inside the chassis.
- *Redundancy*: Whether a given component (e.g., fan, power supply, network interface card, disk drive) has a backup and a fail-over mechanism; redundancy is a method for improving system reliability and availability.
- *Interoperability*: The ability for the different hardware components to interconnect and communicate seamlessly. Software and hardware incompatibilities continue to create difficulties in deploying technology initiatives.

INTERNET ACCESS AND INTERNET SERVICE PROVIDERS

Much as freeways are networks of roads designed to transport people from one location to the another, networks provide the opportunity for data to travel from one location to the next. The Internet is often defined as a highly connected virtual highway that allows data to pass from person to person, organization to organization, and country to country. Data are able to make these cross-country or international trips because the Internet has standardized on a common protocol of

data definitions. To communicate effectively, everyone that transfers data via the Internet adheres to the TCP/IP (transfer communication protocol/Internet protocol) protocols.

Governments, businesses, and citizens gain access to the Internet by subscribing with a locally affiliated ISP. The ISP charges a flat monthly rate for their connection, which usually includes their fee and the cost of a dedicated line from your location to their nearest facility or point-of-presence for connection to the Internet. The dedicated line is typically provided by the local telephone company, and most ISP's make these arrangements for their customers.

Today's backbone consists of high-speed fiber-optic lines. The number of “hops” the data make as they are routed from the government to the backbone will affect the speed at which data are delivered to the citizen. The more computers in between the ISP and the backbone, the slower the connection. When contemplating establishing a subscription with an ISP, several issues should be considered. The ISP should also incorporate numerous security mechanisms to protect the data from unauthorized access and destruction. The ISP should also provide written guarantees on levels of service and technical support. Also, inquire about financial and technical background, and ask about expansion capabilities.

Reliability and speed are two critical issues to consider when deciding on an ISP service agreement. An ISP should provide performance guarantees regarding their uptime or availability. In essence, the ISP should be able to guarantee that their services will be available 99.9% of the time.

Bandwidth refers to the speed with which content can be delivered to the end user. Internet service providers typically provide a range of choices on how the government might connect to the Internet, and the choices will vary according to speed, user load, and cost. Some users connect to the Internet over ISDN telephone lines with connection speeds of 128 Kbps. Telephone companies are offering digital subscriber line connections, which deliver at speeds approximating 1.5 Mbps. Likewise, some cable companies offer high-speed cable access in the 10 Mbps range. Government agencies often link to ISPs with dedicated telephone connections such as T3 lines (deliver at speeds of 45 Mbps), T1 lines (1.5 Mbps), or fractional T1 services (256 Kbps to 1.5 Mbps). The decision as to how much bandwidth is required is based on the number of users that will access the system and the types of services the government wants to deliver.

It is important to keep in mind that many of the citizens will be connected to their ISP by way of dial-up telephone lines. Most consumers connect to the Internet over telephone modems with speed ranges from 14.4 Kbps to 256 Kbps. Because these connections

are slow, web design efforts should account for users employing slower dial-up connections.

Although much attention has been dedicated to Internet activity, government agencies also deploy services using an intranet or extranet approach. In theory, the only difference between the Internet and an intranet or extranet is how the data are routed. With an Internet, the data travel the “open roads” via the high-speed backbone. With intranets and extranets, data are more confined and do not access the backbone. With intranets, data remain within the organization’s network. With extranets, data leave the internal network and travel to outside organizations via dedicated lines. It would not be uncommon for a single government agency to maintain an intranet, an extranet, and also a public Internet.

In summary, as decisions are made regarding the various technical alternatives that a government agency might employ in developing their online service, overarching concerns should always center around system performance issues pertaining to:

- *Scalability*: The system should be capable of handling increasing numbers of users without any disruption to service.
- *Flexibility*: The system must provide a broadly configurable array of hardware and software devices that do not require major reinstallations as enterprise requirements change.
- *Compatibility*: The system must meet expandable configuration requirements, as well as standard industry specifications, to protect future application investment.
- *Manageability*: The system should not demand excessive management time and effort for maintaining online operations.
- *Availability*: The system must be capable of sustaining tens to hundreds of thousands of processing transactions with minimal wait time or downtime.
- *Security*: The system must incorporate an appropriate level of security to prevent unauthorized access to data.
- *Total cost of ownership*: An amalgam of the fully configured system price, including installation, setup, training, infrastructure costs, downtime costs, and ongoing maintenance.

THE POLICY ARENA

Much attention must be given to developing the underlying policy framework that will support online services. Most policy discussions center on issues pertaining to security, privacy, and ethics. However, attention must also focus on substantive, or field/profession-specific, policy issues. As organizations migrate from the first

three channels to the fourth channel, substantive policies related to the actual operation that is being automated may require modification. Nonetheless, this section focuses on policies related to security, privacy, and ethics.

Security

Public agencies are particularly vulnerable to three types of security threats. The illicit modification, destruction, or exposure of data can create serious consequences—jeopardizing not only privacy rights, but inappropriate data access can threaten the safety of citizens. Overriding concerns regarding the moral, legal, and ethical ramifications of security breaches have forced many public managers to take a more risk-averse route, imposing serious limitations on computer information-sharing capabilities.

Unfortunately, as mentioned, the sharing of departmental data can result in the deletion, modification, circulation, and theft of important organizational data. Stallings defined four broad categories of data attacks. Interruption occurs when assets of the system (i.e., certain data elements) are destroyed or become unavailable for use, and interception occurs when an unauthorized party gains access to an information asset.

Conversely, modification relates to tampering with the data, and fabrication occurs when an unauthorized party inserts counterfeit objects or data into the system. According to Icové, Seger, and VonStorch, the motives for these attacks are based on entertainment value, or financial or personal gain.^[1] The results of these penetrations can be serious, and can result in the corruption or disclosure of information, theft of data, or denial of system services. All these threats expose the organization to severe repercussions. Legal liability, as well as the erosion of public confidence that results from an agency’s inability to ensure data security, has widespread societal implications.

Public key cryptography is touted as a potential solution to the security problem. This involves securing data with two keys—one is used to encrypt (scramble) the message, and the other is used to decrypt (unscramble) the message. A key is used to encrypt the message prior to its being sent, and a corresponding key is used to decrypt the message once it has received. In its simplest form, each person in the transaction has a pair of keys—one private and one public. The public key is made available for public access (e.g., to friends, colleagues, etc., or to anyone who might want to send the individual a confidential message). Employing encryption application software such as “pretty good privacy” software, the sender will encrypt the message with the designated receiver’s public key. The only way the message can be decrypted is via the receiver’s

private key, which the receiver keeps confidential. Only the receiver has the private key that is capable of decrypting the message. Thus, files can be encrypted to allow only certain individuals' access to the message content. Interestingly, it is virtually impossible to calculate one key based on knowledge of the other.

Privacy

Privacy is the right to be left alone and the right to be free of unreasonable personal intrusions. Information privacy is the claim of individuals, groups, or institutions to determine for themselves when, and to what extent, information about them is communicated to others. This issue is becoming the most important issue for consumers. Unfortunately, compliance with the Privacy Act of 1974 and its extensions are not simple because the line between legal definitions in ethics is not always clear. Protecting intellectual property on the web is also quite difficult because it is easy and inexpensive to copy and disseminate digitized information. The Organization for Economic Cooperation and Development^[2] recommended the following guidelines:

- Personal data should be obtained by lawful and fair means, and with the knowledge or consent of the data subject.
- Personal data collection should be relevant to the purposes for which that data are to be used. To the extent necessary for those purposes, such data should be accurate, complete, and current.
- The purpose of the data collection effort should be specified, and the subsequent use of such data should be only for the stated purpose as agreed to by the individual.
- Personal data should not be disclosed or otherwise used for any purposes other than that which was set forth in the purpose specification, except with the consent of the data subject by the authority of law.
- Personal data should be protected with reasonable security measures to prevent unauthorized access, destruction, modification, or disclosure.
- The data controller should make available information concerning the existence, use, and nature of all personal data that are collected.
- Individuals should have the right to ascertain from a data controller whether the data controller has personal data relating to that individual and should have access to correct the data, as required.

Ethics

Because the increasing use of information technology has created new ethical challenges, many of today's organizations are developing their own code of ethics

as a guide for their members. Mason, Mason, and Culnan categorized ethical issues into four domains: privacy, accuracy, property, and accessibility.^[3] Privacy relates to the collection, storage, and dissemination of information about individuals.

Data collection principles should focus on collecting only those data that are required to accomplish a legitimate business objective. Collection efforts should not be excessive and should be targeted only toward what is required. All individuals should be allowed to give their consent before data are gathered. However, such consent may be implied from the individual's actions, for example, applications for credit, insurance, or employment.

Accuracy relates to the information's authenticity as it is collected and processed. Steps should be taken to verify the accuracy of the information as it is acquired, processed, stored, and disseminated. Furthermore, the data should be made available to the individual to ensure that they are correct. If there is disagreement about the accuracy of the data, the individual's version should be noted and included with any disclosure of the file. Furthermore, in disseminating information, agencies should provide some indicator as to the accuracy of the information as misleading information can be worse than no information at all.

Property relates to ownership and the issue of intellectual property rights. Organizations need policies concerning who owns what data and how the data are to be employed. To date, many of the issues associated with ownership of electronic data remain under debate. As courts work through the intricacies of ownership, organizations can limit their liabilities by instituting policies pertaining to data ownership rights.

Accessibility relates to the right to access information. All access rights should be based on a legitimate "need-to-know" basis. Public organizations should maintain adequate security practices and procedures.

MANAGEMENT CHALLENGES

Although most public officials appreciate the benefits that e-government solutions can offer, they question their agencies' ability to overcome the hurdles associated with adoption and implementation. A study of state CIOs conducted by NASIRE identified that while funding is always difficult, cultural, organizational, and leadership issues are some of the most significant barriers to adoption. Specifically, the survey revealed that the greatest barriers center on:

- Providing a culture of teamwork, innovation, and change
- Education of executives and managers

- Collaboration and integration efforts
- Skills and expertise
- Diversity and complexity of existing operational processes

These noted concerns demonstrate an overwhelming need to establish a learning environment for coaching, nurturing, and facilitating both the adoption and maintenance of digitally based government services. Specifically, public managers need to be sure to encourage staff to:

- Develop skill sets to understand how to leverage Internet tools.
- Develop mechanisms to ensure responsibility and accountability for planning initiatives.
- Assess impacts as they relate to government outputs and outcomes.
- Understand how program specifications and requirements drive e-government developments.
- Assess impact on *all* citizens.
- Develop and monitor web-based balanced scorecards.
- Develop policies in areas such as security, privacy, electronic payments, standards, investments, digital archiving, encryption, and authentication.

INTRODUCTION

Together with pay (or “direct compensation”) and work environment, employee benefits (or “indirect compensation”) represent a major component in public employers’ total compensation systems.^[1] As a component of total compensation, employee benefits contribute to public employers’ attainment of important human resource goals; namely, attracting, retaining, and motivating qualified employees. As this suggests, competitive employee benefits programs are integral to public organizations’ human resources goals and, ultimately, to organizational performance.

Employee benefits come in two forms—mandated and discretionary. Mandatory benefits, which employers are legally required to provide, include Social Security coverage, unemployment compensation, worker’s compensation, and family and medical leave. These mandated benefits along with several common discretionary benefits [health care, life and disability insurance, retirement pensions, and paid time-off (PTO)] represent what employers have offered traditionally as employee benefits. In recent years, however, traditional benefits packages have fallen short of meeting the needs and expectations of an increasingly diverse workforce. In order to meet these evolving employee needs and expectations and to remain competitive in today’s labor market, public employers have begun to offer a wider array of discretionary or optional benefits. Many of these benefits can be subsumed under the “work–life balance,” “family friendly,” or “worker friendly” heading because they seek to restore a sense of balance between employees’ work, family, and personal time.^[2,3]

market. The traditional benefits discussed below are offered by almost all public employers.

Health Care Benefits

Health care benefits are among the most commonly offered—and most expensive—of all employee benefits. Medical costs for hospital care can run into thousands of dollars in a matter of a few days even for minor illnesses. If prolonged treatment and intensive care are required then the term “catastrophic” refers not only to an illness’s life-threatening nature but also to its financial costs. Naturally, the prospects of paying these costs can be anxiety-producing for employees. Health insurance is the means by which these fears can be, to some extent, allayed. In addition to major medical expenses, health insurance can also aid in alleviating other health-related threats to motivation and productivity. For example, health insurance plans may include additional provisions for prescription of drug, mental health, dental, and eye care benefits. What is included and the extent of that coverage varies substantially from plan to plan with many having multiple levels of coverage under discretionary or optional provisions.

Deductible (e.g., \$300 per individual annually with a \$750 family cap) and co-payment (e.g., 20% of charges) cost containment provisions also alter the real value and costs of these benefits.^[4] These plans may also limit an individual’s total financial exposure through a total out-of-pocket provision (e.g., \$2500 per individual with a \$5000 family cap). It is because of this extensive variability among plans that it is extremely difficult to do cost comparisons on health benefits.

The basic health care covered under insurance plans is likely to be separated into segments requiring different levels of co-payments. Preventive care, such as is found in an annual physical examination and periodic eye and dental checkups, is often fully reimbursed and exempt from any deductible provisions. Relatively common, minor medical procedures may be reimbursed at a 90% level. More serious or long-term

TRADITIONAL EMPLOYEE BENEFITS

By offering traditional employee benefits, employers attempt to provide a measure of security and safety for employees and to meet a minimum threshold of benefits expected by potential employees in the labor

(but not catastrophic and life-threatening in nature) illnesses may require a 50/50 match. Catastrophic care (e.g., cancer and heart disease) whether as a part of the general policy or as an additional or optional benefit again provides something in the order of 80–90% reimbursement. Since the cost of catastrophic care quickly escalates into hundreds of thousands of dollars, even at these reimbursement levels the co-payment requirements are substantial. Reimbursement is also based on the customary and usual rates; in some instances employees are responsible for amounts in excess of these.

Employer-provided health plans usually provide options for spouse and family coverage (paid in full or part by the organization or entirely at the employee's own expense). Concerns about the health of family members can adversely affect an employee's productivity. Hence, the extension of health benefits to family members is essential.

Sick Leave and Disability Insurance

While health insurance covers the costs of obtaining medical care, it does not itself address the loss of income that can also occur due to illness. As a mandated benefit, worker's compensation legally covers employees for job-related accidents. But there are also discretionary benefits that provide income protection. Sick leave serves to continue an employee's income for short periods of illness. Disability insurance provides financially for long-term job loss.

Sick leave, which normally can be accumulated at a rate of 4–8 hr/mo, provides an employee with pay during a short-term illness. This encourages employees to take care of themselves when necessary, instead of attempting to “gut it out” only to lapse into a more long-term illness. It also provides protection to other employees by removing potentially infectious individuals from the workplace. In addition, sick leave can be used for medical appointments and caring for ill family members.

While part of the mandated Social Security program provides long-term disability coverage, the amounts paid out may not be enough to fully or adequately replace lost wages and salaries. Disability insurance for replacing the lost income (enabling one to continue paying for the ongoing expenses that level of income was financing) is often provided. Disability insurance can be either short-term or long-term. Short-term disability policies can often provide 100% of pay replacement for up to a month and replace 50% of pay over the subsequent 6 mo. Long-term disability (often integrated with, i.e., reduced by, Social Security) can replace two-thirds of pay until the disabled employee reaches 65 yr. In case of permanent disability, long-

term medical care insurance for home health care and nursing homes may be necessary (albeit this is quite expensive and is seldom provided as an organization-paid benefit).

Paid Time-Off

In addition to sick leave (which is also a form of PTO), most public employers offer employees additional PTO from work. Normally, this comes in the form of paid holidays and annual leave. Holiday leave normally coincides with observance of national holidays and amounts to about 10–12 days/yr. Annual leave or vacation time is taken at the discretion of the employee in consultation with the employer. Amounts of annual leave vary (e.g., 1–4 weeks/yr, depending on seniority). Conceptually, annual leave can be considered another health benefit: It benefits the individual to step back from the day-to-day stresses in an organization. Vacations refresh and renew. Time-off also allows employees to devote more time to friends and family, personal pursuits, recreational and leisure activities, and community service.^[5] As is the case with sick leave, vacation time can often be accumulated and applied toward retirement. Since this can create a substantial liability, the amount of leave that can be accumulated may be capped.

All types of leave—vacation, sick, and paid holidays (secular and religious)—may be lumped together in a leave bank. These comprehensive approaches to leave are often called PTO policies. When an organization has a PTO policy, employees are given a set number of days which they may use for sick leave, vacation, or some other form of leave (e.g., bereavement leave or personal leave). The PTO approach has several advantages. For instance, PTO eliminates concerns about sick leave abuse. It also reduces the organization's leave accounting and monitoring requirements. For example, with PTO managers are not required to determine whether an employee's leave should be coded “sick leave of vacation time”—it all comes out of the same PTO pool. Finally, PTO avoids the political questions that can arise regarding which holidays are observed and which are not.

Retirement Pension Benefits

Retirement pension benefits, like health care benefits, are both common and expensive. While the Social Security program will provide modest income benefits for retirement, employer-sponsored pensions provide public employees the security of knowing that they will have the needed income in their retirement years. For government employers, providing for employees' postemployment financial security is a matter

directly related to employee productivity: “To ensure employees’ current commitment and attention on productivity, future security must be guaranteed.”^[6]

There are two major types of pensions, defined benefit (DB) plans and defined contribution (DC) plans. The DB model has been, and continues to be, the predominate pension model in the public sector, whereas the private sector has increasingly opted for the DC model. Under a DB plan, an employee’s retirement benefit is calculated by a predetermined formula which normally includes employees’ age, salary, and years of service. The formula defines what employees who are vested (vesting typically occurs after 5 yr, but can take as long as 10 yr) in a given DB plan can expect to receive as a retirement benefit. Defined benefit plans are favored by many employees for this income predictability, the convenience of having professional money managers investing their assets, and the inflation countering cost of living adjustments retirees often receive. On the downside, DB plans can create large unfunded liabilities for employers are not easily portable for employees wishing to change employers, and do not allow individual employees to make investments that might produce higher rates of return.

In contrast to DB plans, retirement benefits under a DC plan are variable (i.e., undefined): employers and employees make regular contributions—usually at a fixed percentage of employee salary—to individual employee accounts. These contributions are invested by employees in a variety of employer-provided investment options. The accumulation of employer and employee contributions in individual employee accounts and the returns realized through the investment of those account assets determine employee retirement benefits. Commonly cited advantages of the DC model include the portability of benefits (since these are often minimal, e.g., 1 year, vesting requirements), individual control of investments, a clear bottom-line picture of what an employee has available for retirement, and for employers, the elimination of long-term pension obligations, and uncertain pension funding requirements. Disadvantages include the assumption of investment risk by employees and replacing professional money managers’ investment strategies with individual investment by employees possessing varying levels of financial planning and investment sophistication.

Public employers have also introduced hybrid pension plans that combine elements of both the DB and the DC models. Combination plans, for instance, direct the employer’s contribution to a traditional DB plan while the employee’s contributions are directed to a DC plan. With cash balance plans, employees receive benefits credits (i.e., a percentage of pay) based on years of service or, in some cases, years of service

plus age. Like DC plans, employers set up individual employee retirement accounts but these are really “phantom” accounts since the employer’s actual pension plan contributions are determined actuarially (i.e., sufficient contributions to cover future benefits), pooled into a pension fund, and invested collectively as in a DB plan.^[7] Thus, employee “accounts” track the hypothetical cash value of an employee’s pension benefit. This cash balance is the defined retirement benefit the employee is entitled to.

WORK-LIFE EMPLOYEE BENEFITS

In addition to traditional employee benefits, public employers have increasingly opted to enhance their employee benefits packages with a wide array of discretionary benefits. These work-life benefits go beyond the safety and security needs of traditional benefits to address employees’ diverse needs in a holistic manner that balances work, family, and personal needs.^[5] These benefits policies recognize the stresses that employees face in their lives and the impact that these stresses can have on employee performance.^[8]

Employee Assistance and Wellness Programs

Employees face personal problems and difficulties that can affect their ability to concentrate on work. In response, many employers have initiated employee assistance programs (EAP). Employee assistance programs provide employees with counseling and other forms of assistance for a variety of personal problems. For individual employees the availability of counseling, drug and alcohol treatment, financial advice and planning, legal assistance, and other EAP services can be quite encouraging (for example, see Refs.^[9–11]). Employee assistance programs are usually contracted for from outside groups and organizations. For example, a nonprofit, umbrella organization may serve as an overall EAP contact agency and coordinator. In such cases, the independent EAP can provide excellent services due to its community-wide economy of scale. The independence of outside EAP providers also assures employees confidentially of what are still personal problems.

Wellness programs focus on preventative health care. They undertake to encourage behavior that lead to good health and ease stress. They encourage individuals to exercise, eat healthily, and give up hazardous habits (e.g., smoking). Many of these activities are geared to behaviors that are associated with the risk of cancer and heart disease—two of the most expensive insured illnesses. As a part of such efforts, organizations may actually establish gyms or health spas for

their employees or, alternatively, subsidize memberships (with reimbursement linked to actual spa/club attendance). Many large organizations construct walking trails around and build their parking lots at the edge of their “campuses.” As a social activity, employee sports teams may be encouraged. In all of these instances, the goals are to improve employee health (which should result in greater productivity) and to reduce employer and employee health care costs.

Human Capital

Education, training, and professional conferences are all means of developing human capital and enhancing organizational productivity. The knowledge-based organization must invest in its people if it is to ensure its own existence and prosperity. While clearly designed to make the organization better able to cope with its environment, employee development is also a major individual benefit.

Employee development has the added advantage of not only enhancing technical skills, but also of psychologically motivating the individuals involved. The organizational investment is a recognition of the employee’s worth. The added skills, while paid for by the organization, belong to the individual. For the organization to fully obtain the benefits of its education and training programs, it must retain the individual. This implies a long-term relationship and fosters organizational commitment and loyalty.

Tuition reimbursement and educational leave are the two popular means of encouraging employees to add to their knowledge and skills. Prior approval of course work is usually required in tuition reimbursement programs. These programs also usually stipulate that courses are job-related (thus benefiting the employer and the employee) and that the minimum of letter grade (e.g., a “B” or equivalent) be earned. Educational leave may vary from a flextime arrangement (with work hours made up) to granting PTO for courses. A few public organizations (such as the military) even send employees to school as their duty assignment. In all of these cases, employers help individuals achieve their personal goals and, at the same, benefit by having those individuals who apply their new knowledge, skills, and abilities on the job immediately.

Family (or Worker) Friendly Benefits

Employers have begun to realize the interdependence of work life and family life: Even when an employee is physically present at work, he or she may be pre-occupied or otherwise affected by family or personal concerns.^[12] Many employers have responded by

offering family friendly benefits. Originally, these benefits were in response to demographic and social changes that have made women a permanent part of the modern workforce. The strains of dual career couples, juggling careers, and family obligations only exacerbated things. Since women in the workforce still bore the major brunt of family responsibilities, organizations found it necessary and advantageous to make adjustments to accommodate these requirements. The resulting family friendly benefits come in a variety of forms, including flextime (geared to school hours), flexible schedules and compressed workweeks, flexi-place (work at home or telecommuting), job sharing, leave pooling and sharing, elder care, child care, and educational assistance (e.g., tutoring, scholarships, school matching, etc.) for dependents (for example, see Refs.^[13–15]). Employers also may offer dual career couple (or trailing spouse) programs when recruiting new employees. Such programs range from assisting in job searches to actually creating a job for the spouse.

More recently, observers have suggested replacing the term family friendly with worker friendly or work–life balance.^[2] This broader term recognizes that demographic changes continue to affect the workplace, resulting in more single and childless workers and in more unmarried couples. Since flexible scheduling, leave, and other work–life policies are beneficial to employees both with and without families, the term worker friendly may be more appropriate. Also, in relation to changing demographics, some employers are beginning to offer domestic partner benefits which extend the same benefits married couples receive to unmarried couples (i.e., homosexual and, in some cases, heterosexual couples) living together.

Other Benefits

There are a variety of other employee benefits that are offered, to varying degrees, by employers. Directly and indirectly, employers can subsidize living expenses. Some employers provide housing allowances and underwrite mortgages. Some may actually provide the housing itself (e.g., police departments may offer police officers free housing in high-crime neighborhoods). In recruitment, employers often pay for relocation and temporary housing expenses. In some cases, the organization may even assist in the sale (including buying) of an existing house.

Employers also provide a number of convenience benefits. For example, on-site commissaries and cafeterias can reduce food costs. These facilities may also package “take-out” meals for employees to take home at the end of their workday. Other retail services (e.g., dry cleaning, car washing, and/or oil changes, movie passes, tickets to sporting and entertainment events,

etc.) may also be made available to employees at discounted rates.

ISSUES IN EMPLOYEE BENEFITS

Employee benefits are integral to organizations' human resource and performance goals. To remain competitive in the labor market, employers must offer an array of benefits that meet the diverse needs of an increasingly diverse workforce. In designing and administering employee benefits programs, public organizations face a host of challenges. Some of the more salient ones include ensuring that employee benefits are efficient, effective and competitive, protecting employee privacy, and containing costs.

Efficient, Effective, and Competitive Employee Benefits

With employee benefits, it is a truism that there is no such thing as "one-size-fits-all." Despite organizations' best intentions, one generous benefits package is unlikely to meet the needs of all workers. One way this potential motivational hurdle can be cleared is through cafeteria benefit plans. Cafeteria plans attempt to fine-tune the benefits offered by allowing individual employees to allocate their benefit dollars among those options that they themselves deem most useful. Some benefits are obviously mandatory for all employees, others are a part of the standard fare of traditional benefits expected by all employees. However, there are still other benefits that are merely in the desirable category. While many employees may often desire them, for others they are clearly inappropriate. To provide such benefits to all employees is a waste of resources both in terms of the money spent and in terms of the motivation they fail to elicit.

While cafeteria plans offer means for ensuring a fit between employee needs and the benefits provided, a more fundamental approach is to carefully plan, administer, and evaluate the benefits offered. In designing employee benefits, organizations should conduct a needs assessment to include such things as employee demographic data, employee-identified benefits needs, utilization levels for current benefits, and satisfaction with existing benefits.^[16] Once appropriate benefits options have been identified, organizations must then carefully implement and evaluate their benefits policies. This requires several steps: setting policies and values for the benefits program, identifying options or models for specific benefits to be offered, articulating the goals and objectives of the benefits program, planning for program implementation, specifying

outcomes and benefits, and measuring and evaluating benefits.^[16]

Steps such as these can go a long way toward ensuring that an organization has an attractive array of employee benefits that are effective in meeting employee needs and the organization's human resource and performance goals. Having knowledge about the type of benefits offered by the other competing organizations and about which benefits are important to employees enables an organization to design a plan that will then remain competitive in the labor market, meet employees' needs, and produce the desired productivity gains.^[1]

Privacy Concerns

Health concerns may also lead to the organization becoming more intrusive. Lifestyle behaviors, which increase health risks (and potential costs) may be targeted for modification—"lose the habit or the organization loses you." The exercise, diet, and stress reduction options may become required.

Growing concerns are also evident in regard to the use of medical records and genetic testing. Illness is not neutral; they are viewed as "deserving" and "undeserving." Individuals attach social stigmas to illnesses that are the consequences of lifestyle choices and, therefore perceived as preventable. Whether the dissemination and use of such information is deemed to be relevant and job-related is still a subject of debate. Clearly, information regarding these stigmatized illnesses can exert a negative effect on careers.

Finally, privacy provisions of the Health Insurance Portability and Accountability Act of 1996 (HIPPA) create additional requirements for health care insurers and providers and for employers. Specifically, HIPPA requires employers to keep employees' health-related information protected and secure.

Cost Containment

As benefits packages become more generous and as certain benefits costs (e.g., health care) continue to rise, organizations are looking for ways to contain benefit costs.^[17] In addition to the deductible and co-payment mechanisms discussed above, health care cost containment has led to the creation of various managed care options as alternatives to the traditional fee-for-services physician. The Preferred Provider Organization lists doctors who accept patients under a set-payment schedule (analogous to Medicare provisions). The Health Maintenance Organization (HMO) is a business that provides full medical care for a preset fee. Each of these options, more or less, introduces

financial incentives in balance to the provision of medical services.

Under HMO plans doctors are usually on salary rather than “commission” as is the case under fee-for-service arrangements. In addition, it is usually some form of gainsharing or bonus incentive included as an added inducement against overmedication. It is assumed that the doctor’s intrinsic desire to professionally serve their patients will counterbalance these financial incentives to insure adequate patient health care.

A utilization review is conducted prior to authorizing a procedure. The purpose is to ensure that necessary medical services are provided while “what if” and “wouldn’t it be nice” are discouraged. These utilization review procedures often raise the specter of individual’s being denied needed services for the sake of corporate profits. Without a doubt, some of this occurs especially where reviewers lack the relevant professional expertise of either physicians or registered nurses. Even so, the traditional fee-for-service approach often profited by ordered unneeded tests. Since there is an added danger in overmedication and from unnecessary procedures, utilization review is also likely to protect an individual’s health and well-being. Stringent cost containment efforts can adversely affect health care options for employees if physicians and clinics or HMOs refuse to accept government employees (or new employees) due to the payment schedule. This can create a significant access problem.

Cost containment also is an issue for retirement pension plans. Traditional DB plans can create long-term unfunded liabilities for governments. A variety of political, social, and economic developments have strained public employers’ ability to meet pension commitments in recent years. Politically, elected officials may choose to enhance pension benefits for an active political class—public sector employees and retirees—without always fully considering the long-term financial implications of those enhancements. Short-term budgetary pressures also affect retirement pensions. For example, elected officials sometimes choose to defer employer payments to pension funds—or worse yet, “raid” the pension funds for supplemental cash—in order to meet short-term budget shortfalls. Socially, demographic trends in the United States point to an aging population. The prospect of a large cohort of employees becoming eligible for retirement coupled with longer life expectancies means that pension systems face potential strain. Economically, stock market downturns in the early 2000s created alarming (at least in the short-term) pension fund investment losses in the first few years of the 21st century.

To ameliorate these costs concerns, governments are considering a number of options. As mentioned

previously, some governments are considering switching to DC programs to limit their long-term pension fund liabilities. Other governments have issued pension obligation bonds, which allow them to meet current unfunded pension fund liabilities but spread the costs out over the life of the bonds. Finally, some governments are creating two-tiered pensions plans in which newly hired employees receive less generous pension benefits than existing employees.

CONCLUSIONS

Employee benefits are a crucial component of an employers’ total compensation systems. Designing and administering an attractive yet affordable employee benefits program is vital for public organizations seeking to recruit, retain, and motivate qualified employees. What is more, employee expectations and needs continue to evolve, thus placing greater pressure on employers to seek innovative benefits solutions that meet both organizational and employee needs. Public organizations are responding to these challenges with employee benefits packages that meet employees’ security and safety through traditional benefits and employees’ personal needs through a host of work-life benefits.

Enterprise: Public versus Private

Thomas S. Nesselroth

Urban and Regional Studies, Department of Economics, University of Wisconsin-Green Bay,
Green Bay, Wisconsin, U.S.A.

INTRODUCTION

For the major part of the twentieth century, a key topic of political economy was the question of the appropriate scope of government suppliers of goods and services relative to private suppliers. In the socialist-planned economies of the former Soviet Union, Eastern Europe, and China, state enterprises dominated most of the economy. Moreover, a great number of developing countries sought economic growth via state-owned firms in key sectors of the economy where often some 10–12% of the national output was produced. Likewise, in the capitalist welfare states—for example, most northern European countries, the United Kingdom, Australia, and New Zealand—the dominant view was that government enterprises should control the commanding heights of the economy. Typical examples were the railroads, the mining sector, telecommunications, banking and insurance, and key industrial sectors such as chemicals and steel. Of course, the nationalization of education was strongly supported without serious debate. In distinct contrast, in the United States, direct government production was largely limited to major parts of the education sector, the postal system, and local government utilities and services such as police/fire protection and refuse collection.

Since the mid-1970s, however, radical change in thinking concerning the appropriate scope of direct government production has occurred.^[1] The collapse of Communism in Europe has led to massive privatization of formerly state enterprises, and the privatization movement has also taken hold in the capitalist welfare states and spread extensively throughout the developing world. In the United States, serious questions are now being raised with respect to the continued direct government production of education, refuse collection, prisons, housing, mail delivery, and air traffic control, among others.

The widespread enthusiasm for government enterprise, especially during the first 30 years after World War II, seems largely linked to the failures of the market economy during the great depression and the apparent success of the Soviet-planned economy. However, advances in economic theory, emerging empirical research, and changing circumstances have greatly weakened the case for direct government provision.

THE DESIRABLE SCOPE OF PUBLIC PROVISION: A MODERN VIEW

What kinds of goods and services should be produced by public enterprises rather than private suppliers?^[1] Let us begin by examining the case of benevolent government; that is, we assume that the government's goal is to maximize society's welfare. It is instructive to note then the conditions under which it makes no difference whether production is public or private. In brief, if the government knows precisely what kind of good or service it wants to produce, then all the relevant product characteristics can be specified in a contract (or regulation), and production can be contracted out to private suppliers. In such cases, governments may continue to *finance* production (e.g., education), but direct government production is no longer essential. For example, it is often believed that a government postal system is required because the delivery of mail to sparsely populated areas is generally unprofitable. Yet, the government can easily specify in a contract that private firms operating a postal concession must deliver mail to all areas.

Of course, the ability to write perfect contracts and regulations often does not exist. There are many instances where the government cannot precisely and completely specify and enforce all the *quality* dimensions that it deems desirable. In essence, many real-world cases involve what may be labeled as *incomplete contracts*. In many cases, the government may desire the supply of specific product characteristics that are impossible to specify and enforce contractually, so-called non-contractible *quality*. For example, the government may be concerned with how well prisons treat inmates, how well schools inculcate character and social responsibility, and how innovative producers are. Consequently, in this view, an important element in choosing between public or private production is how different forms of ownership affect the incentives to deliver the desired non-contractible quality attributes as well as the cost. In this respect, Shleifer states:^[1]

[C]onsider two types of investment incentives: those to reduce costs and those to improve quality or to innovate. When assets are publicly owned, the public manager has relatively weak incentives to make either of these

investments, because this manager is not the owner and hence gets only a fraction of the return. In contrast, private regulated contractors have much stronger incentives because, as owners, they get more of the returns on the investment. Which ownership structure is more efficient depends on whether having high-powered incentives to invest and innovate is a good idea.

However, the case against government enterprise is not so clear-cut when private suppliers have strong incentives to reduce cost, and increase profits, by decreases in noncontractible quality. Put differently, in some cases, efficient production may require *soft* incentives. For example, private schools, hospitals, prisons, and so on may have strong incentives to hire less well-trained and qualified workers to reduce labor costs.

Two market forces, however, often attenuate inefficient decreases in noncontractible quality. First, if the product market is reasonably competitive, consumers will shun suppliers making inefficient reductions in noncontractible quality. Second, in many markets, a key element of long-run profitability is repeat sales. In such cases, private suppliers are given strong incentive to avoid actions that increase short-run profitability at the expense of long-run profitability. Finally, it should be noted that private, not-for-profit firms often emerge in a market economy in those instances where soft incentives seem particularly important. In the United States, for example, a large sector of private, not-for-profit hospitals and universities has long existed.

Assuming benevolent government, Shleifer summarizes the case against government enterprise as follows.^[1]

These considerations point to a rather narrow set of circumstances in which government ownership is likely to be superior. These are the situations in which: 1) opportunities for cost reductions that lead to noncontractible deterioration of quality are significant; 2) innovation is relatively unimportant; 3) competition is weak and consumer choice is ineffective; and 4) reputational mechanisms are also weak. This list gives, in my opinion, a fair sense of how tenuous, in general, is the normative case for government production.

GOVERNMENT FAILURE AND THE CASE FOR PRIVATIZATION

So far, the discussion has assumed a benevolent government seeking to maximize society's welfare. It has now long been recognized, however, that government policies and programs often fail in this respect. In particular, special interest groups in many cases dominate the political process and the political outcomes that emerge are often a pale reflection of society's general interest.

In brief, highly inefficient policies and programs are adopted that to an important extent serve to transfer wealth to politically powerful interest groups. In this respect, government enterprises are often used by the ruling party as a means to increase their political support via above-market wages, excess employment, and outright transfers of wealth. In developing countries, in particular, government monopolies and projects are created expressly to transfer wealth, often to a handful of relatives and key political supporters of the ruling family or party. Shleifer summarized as follows: "In other words, state firms are inefficient not just because their managers have weak incentives to reduce costs, but because inefficiency is the result of the government's deliberate policy to transfer resources to supporters."^[1]

Moreover, in a highly nuanced critique of both neo-classical economics and socialist economic planning, Stiglitz also recognized both a political and a economic case favoring privatization.^[2] To begin, privatization is seen as a means to weaken the coercive powers of the state and to depoliticize enterprise operations. Moreover, Stiglitz argued that a strong economic case can be made for privatization, but one that goes beyond the standard arguments regarding differences in managerial incentives. Stiglitz stressed three points. First, privatization is seen as enhancing the government's commitment to a competitive economy and to sharply circumscribing enterprise subsidies. Second, incentives are strengthened as privatization increases the likelihood that hard enterprise budget constraints will be substituted for soft budget constraints. Third, a dynamically efficient economy requires hard budget constraints to enhance the economy's "selection mechanism, through which it is decided not only which enterprises survive but also which enterprises garner additional resources to expand. Those who cannot meet the market test are weeded out."^[2]

COMPARATIVE ENTERPRISE EFFICIENCY: THE EVIDENCE

De Alessi undertook the first major survey of comparative enterprise efficiency within the context of a broader analysis of the economics of property rights.^[3] De Alessi concisely examined key empirical studies from 1960s to 1970s that assess the relative efficiency of government vs. private enterprises with respect to water and electric utilities, urban transit, airlines, banks, hospitals, fire prevention services, and refuse collection. De Alessi concluded from his review that strong evidence exists for the superiority of private ownership.

In contrast, three major reviews during the 1980s found little or no difference in efficiency between public

and private enterprises.^[4] In brief, these studies suggest that differences in enterprise efficiency are overwhelmingly related to the degree of competition faced in the market, not ownership per se. Vining and Boardman labeled this the *primacy of competition vs. ownership* argument.^[5] In the extreme, the argument implies that in highly competitive markets, without significant distortions, ownership does not matter for enterprise efficiency. More recent evidence strongly counters this view, however.^[6]

To begin, Mueller presented a table of some 50 studies examining comparative enterprise efficiency and concisely summarized the cost differences found.^[6] In only two studies were government enterprises found to be more efficient. In over 40 studies, government firms were found to be the higher cost producers, generally more than 20% higher, and often 40–60% (or more) higher. The case favoring private ownership is further buttressed by several major empirical studies undertaken since the late 1980s.^[6] Of particular note are the related studies of Boardman and Vining, and Vining and Boardman.

A key argument made by these authors is that the relatively few studies that show public enterprise superiority, or at least no difference in efficiency, cannot convincingly demonstrate their claim. In brief, these studies compared firms in sectors with characteristics of monopoly, duopoly, and/or heavy regulation, and thus are not relevant to assessing comparative efficiency in a competitive market. In this respect, Vining and Boardman stated:^[5]

Many studies cited ... pertain to sectors where "firms" have geographic monopolies (electric utilities, water, refuse, fire services) and, therefore, do not directly compete with each other. While these studies tell us something about the effect of ownership on performance in non-competitive, monopoly environments, by definition they cannot inform us about the effect of ownership in competitive environments.

With respect to the empirical evidence, Boardman and Vining used a statistical analysis capable of measuring the independent effect of ownership on comparative enterprise performance.^[6] They estimated their model using several measures of profitability and efficiency as related to three enterprise types: state-owned enterprises, mixed enterprises (a hybrid ownership category where the government has retained an equity position), and private enterprises. Their study used data on the 500 largest manufacturing and mining firms from outside the United States as of 1983. After controlling for a range of factors (e.g., firm size and degree of product market competition), Boardman and Vining found that ownership has a

substantial independent effect on enterprise profitability and efficiency. For example, on average, state-owned enterprises have a return on equity almost 12% less than comparable private enterprises. Relatedly, two studies using a similar methodology, but focusing on the 500 largest non-financial enterprises in Canada (Vining and Boardman) and the 500 largest non-U.S. corporations (Picot and Kaulman), also find credible evidence that state enterprises are less efficient than private enterprises.^[6] More recently, Boubakri and Cosset examined changes in the economic performance of 79 enterprises from 21 developing countries that experienced full or partial privatization between 1980 and 1992.^[6] They find substantial increases in profitability, operating efficiency, capital investment spending, output, employment level, and dividends following privatization.

CONCLUSION

Since the mid-1970s, a radical change in thinking concerning the appropriate scope of direct government production has occurred. The reorientation has been stimulated in part by advances in economic theory—in particular, the theory of ownership and contracting, a greater appreciation of the link between ownership and innovation for a dynamically efficient economy, and a fuller understanding of the adverse consequences of government ownership. Also playing a role is the increasing competitiveness of market economies and improvements in government contracting and regulation. Finally, much real-world experience and a growing body of high-quality empirical research supports the comparative efficiency of private enterprise.

Entitlements and the Congressional Budget Process

Patrick Fisher

*Department of Political Science/Philosophy, Monmouth University,
West Long Branch, New Jersey, U.S.A.*

INTRODUCTION

Entitlements are government spending programs for which Congress has set eligibility criteria—age, income, location, occupation, etc. If meeting the criteria, a recipient is “entitled” to the money. Due to the rapid growth of entitlement programs over the past four decades, less than half of the federal budget today is considered “controllable” through the budget process. The fact that entitlements are broadly considered to be relatively “uncontrollable” is somewhat misleading. While Congress cannot control levels of eligibility in the population, it can control such levels under the law (cost of living adjustments, for example). It would be accurate to say, however, that politically, entitlements are relatively uncontrollable. Entitlements are available for a vote, but only if Congress decides to arrange one. Congress can change or repeal any law it passes, and lawmakers can revisit entitlements at any time to reduce or eliminate them.

THE GROWTH ENTITLEMENT SPENDING

Federal entitlement programs range from gigantic ones, such as Social Security and Medicare, to extremely small ones, such as an indemnity program for dairy farmers whose milk is contaminated by chemicals. Some entitlement payment levels, such as for unemployment insurance, are difficult to predict, while others, such as Social Security, are fairly predictable. While most entitlements go to people, some also go to other units of government. The Title XX Social Services block grant, for instance, goes to states based on population.

What makes entitlements different from the other major forms of congressional spending is that they are mandatory; money must be provided until the program is changed by Congress. By contrast, discretionary spending is good only for one year, and Congress has to renew it annually through the appropriations process. Less than a third of the budget during the Kennedy administration, entitlement, and mandatory spending is now more than one-half of the budget. Discretionary spending (for domestic, defense, and international purposes), on the other hand, has gone from making up 63% of federal government expenditures

in 1962 down to about a third in 2000 (see [Table 1](#)). The tremendous growth of entitlements may be problematic, because entitlements limit the ability of Congress to maneuver in adopting the budget. Congress, therefore, may not be given the flexibility it needs in the budget process. Because most government expenditures are disbursed in long-term authorizations, there is some question about the democratic accountability of the budget process.^[1]

ENTITLEMENTS AND THE TRANSFORMATION OF THE CONGRESSIONAL BUDGET PROCESS

Congress has deliberately authorized entitlement spending because it believed that the government should protect certain obligations from yearly political controversy. Members of Congress have some control over annual entitlement spending, but the total changes in any single year are a relatively small part of the entire budget. Over the long run, however, there is the potential for adequate flexibility within the budget for Congress to make significant changes in the composition of the federal budget.^[2]

Budgeting is a different process from what it once was. The postwar transformation of federal budgeting from a control process to one oriented toward spending growth has upset the relationship between available resources and demands on the budget. Claims on the budget became stronger when budgeting was an expansionary process, and it has not been easy for Congress to reverse course, as the climate has become more constrained.^[3] Budgeting for growth (1950s–1960s) differs from budgeting for stabilization or cutback (1970s–1990s). The expectation of growth makes it easier to please greater numbers of actors, because government can afford to give people what they want. As critics of congressional budgeting argue, this transformed budgetary environment has become a long-term threat to Congress’s power of the purse, because Congress had become unwilling, for political reasons, to control mandatory spending.^[4]

The budget cannot be completely isolated from the economy—the economy drives the budget. The assumptions on which the budget’s prescriptions are based all lie at the mercy of national economic conditions.

Table 1 The growth of entitlement spending: budget expenditures for fiscal years 1962 and 2000

	2000	1962
Entitlements and mandatory spending	55%	31%
Domestic discretionary spending	16%	12%
Defense spending	16%	46%
Interest on the national debt	12%	6%
International discretionary spending	1%	5%

Source: Congressional Budget Office.

Beginning in the early 1970s, demands on the budget soared more than resources did. Congress did not foresee in the 1960s that the budget situation would become much more dire as the economy stagnated.^[3] Politics and economics combine to shape the varying patterns of activity for the legislators working on the budget.^[5] On the one hand, economic goal-setting has often been a frivolous exercise in symbolic politics in the absence of realistic means to achieve goals. Year after year, the most important factor in determining the current year's budget allocations is last year's budget allocations. On the other hand, the establishment of inflexible methods to achieve a goal may simply make other problems worse and threaten the economy.^[6] As economic conditions change, so do priorities; legislators need to maintain their ability to respond to varying economic conditions.

THE POLITICAL SIGNIFICANCE OF ENTITLEMENT PROGRAMS

There are good policy reasons for entitlement spending. Entitlements can be an efficient way of the government providing services, and it seems logical that the government may want to avoid the political difficulty of not being able to maintain its promises, regardless of the financial condition of the government, which is, after all, highly reliant on the state of the economy. One problem with entitlements is that, to a large degree, they go to fund what has been called "middle-class welfare." That is, entitlement benefits are dispensed largely on the basis of criteria other than income (such as age). Programs that require proof of low income to receive benefits are a small proportion of entitlements; more than three-fourths of all entitlement spending (including Social Security and Medicare) is directed toward non-means tested programs, where recipient eligibility is not based on need (see Table 2).

The huge surge in entitlement spending came between 1966 and 1976. During this period, the creation of programs such as Medicare, Medicaid, and food stamps combined with expanded Social Security

Table 2 The top entitlements

Rank	Program	Expenditures (billion of \$)	% of GDP
1.	Social Security	406.0	4.1
2.	Medicare	216.0	2.2
3.	Medicaid	117.4	1.2
4.	Other retirement/disability	87.8	0.9
5.	Farm price supports	30.5	0.3
6.	Unemployment	20.7	0.2
	Total means tested	235.9	2.4
	Total non-means tested	793.9	8.1

Source: Congressional Budget Office.

benefits to provide an enormous boost to entitlement spending. From 1966–1976, entitlements more than doubled in relation to the size of the economy, growing from 5.4% of the GDP to 11.3%, where it leveled until health care costs began driving entitlement costs up again in the 1990s. All together, three entitlement programs—Social Security, Medicare, and Medicaid—make up more than 70% of all mandatory spending.

The rapid growth of entitlements has given them a bad name in some quarters, because they were held to blame for deficits that plagued the federal government through the 1980s and early 1990s. Furthermore, entitlements came to be seen as a means by which the authorization committees could circumvent the appropriations committees. Dramatically increased entitlements spending, without a corresponding willingness to raise taxes, broke the back of the classical budget process.^[1]

Conservatives fear that the result of the growth in entitlements will be higher taxes and deficits; liberals fear that entitlements will squeeze out other programs and, if they keep growing, use up future revenue increases. Yet both conservatives and liberals in Congress have been unwilling to confront the growth in entitlements. As a result, as Social Security has been placed politically out of reach and other entitlements get harder to contain, discretionary spending has become a larger part of what is up for grabs in the short term. This, in turn, has curtailed the power of the appropriations committees. The piece of the budget they control was nearly three-fourths of the budget during the Kennedy Administration; now it is down to little more than one-third of the budget and is dropping.

Some argue that the difficulty in reducing or eliminating entitlements is exactly what the architects of entitlements had intended, and exactly what contemporary Congresses ought to be doing. Entitlement programs dole out benefits automatically so that basic benefits would not be subject to the year-to-year inconsistencies of the appropriations process. Furthermore,

entitlements are growing as they were supposed to, especially during a bad economy. The so-called automatic stabilizers such as unemployment insurance and food stamps are designed to pick up the slack during bad economic periods.

Entitlement programs, however, do not always have the effect that their creators intended. Times change, but often, established entitlements are unable to change as new circumstances dictate. A problem with entitlements is that it is much easier to start an entitlement for an apparently needy group than it is to terminate an entitlement after it no longer makes sense. Most subsidy programs, for example, began for the same reason as programs to benefit individuals—that is, they were a response to hardship cases. In their early days, aid was targeted on the basis of an immediate need or a significant national purpose. Over the years, many of these programs, especially in agriculture, lost their focus as conditions changed. Instead of being phased out, many were expanded for political purposes.^[7]

Another entitlement that has had unintended consequences is the civil service retirement program, where expenditures are currently skyrocketing. Civil service retirement is subject to its own demographic characteristics: the number of retirees has increased dramatically in recent years because of the large number of civilians on the federal payroll during and following World War II. Furthermore, expenditures will increase more rapidly in the future because of the benefit characteristics of the system. Not only do federal retirees receive relatively generous benefits, but the system encourages early retirement, further adding to the costs for the government and taxpayers.^[8]

Some of the largest and most expensive programs in the federal budget, such as Social Security and Medicare, are entitlements that are perceived to be politically hazardous to alter. Social Security, in fact, is called by politicians “the third rail of American politics”—touch it and die. Given a choice, members of Congress would rather look almost anywhere else for ways to cut spending. Unfortunately, the cost of Social Security and Medicare is rising so fast that they risk crowding out the rest of domestic spending. The political power of Social Security was demonstrated with a House vote in 1994 that called for attacking the deficit by reining in entitlement spending, but with a provision excluding Social Security from any cuts. A move to keep Social Security on the chopping block along with other entitlement programs lost by a resounding vote of 392-37. After this vote, the House then proceeded to vote 424-0 to prohibit any move to increase the Social Security payroll tax to help fill the gap in case entitlement spending ever exceeds preset limits.

The problem remains, however, that it is questionable whether or not the budget can be balanced over the long run without reforming Social Security.

Social Security is the largest single spending program in the federal budget, and at a cost of \$406 billion in 2000, it accounted for nearly a quarter out of every dollar the federal government spends. Defenders insist that it should remain as it is because it is self-financed by the payroll tax, which is currently running a huge surplus. A problem with this argument is that it leaves the mistaken impression that the biggest program in the budget would not affect the rest of the budget. Critics argue that the sheer size of Social Security makes it a must for any sizeable budget cuts. As the size of the House votes in 1994 show, however, any meaningful cuts in Social Security in the near future are extremely unlikely.

Medicare's political power was demonstrated after Congress passed a Medicare Catastrophic Coverage Act of 1988, which was to be paid for in large part by an income surtax on middle- and high-income beneficiaries. After ugly demonstrations led by those who were going to have to pay the surtax, however, Congress backed down and repealed the measure. Despite Congress' experience with the Catastrophic Coverage Act, there still remains the fact that you cannot control entitlement spending without altering Medicare and Medicaid.

It is doubtful, however, that Medicare (the federal health insurance for the elderly and disabled) and Medicaid (the joint federal-state health program for the poor) can be controlled without overhauling the nation's entire health system. Because climbing health care costs are expected to increase the deficit significantly as the baby boom generation nears retirement, early in his administration, President Clinton proposed attempting to channel the pressure for continuing deficit reduction into the health care reform debate. Politically, however, Clinton's health care strategy proved to be unsuccessful, and prospects for significant health reform were shattered with the Republican takeover of Congress in 1994. The fact remains, however, that to reduce Medicare and Medicaid effectively, the whole health care system has to be reformed.

Taken together, Medicare and Medicaid are almost as expensive as Social Security. They are also currently by far the fastest growing entitlements. Medicare and Medicaid have been growing at a tremendous rate because of demographics and technology. Demographically, health costs increase as Americans get older; the elderly consume far more health care services than younger people. Medical technology makes health costs more expensive, because it provides doctors and hospitals with more things they can do for patients. Thus, not only are our health costs skyrocketing, but the rising costs are not helping to cover those who need health care the most. The elderly receive a disproportionate share of the federal health insurance, largely because they have a great deal of political power.

The budgetary process, therefore, is an inherently weak mechanism for controlling mandatory entitlements such as Medicare and Medicaid.

When the budget is squeezed, as it has been for the past three decades, the easiest place to formulate budget cuts is in the “discretionary spending” portion of the budget. Discretionary spending includes the choices Congress has to fund state–local assistance and federal domestic programs which cover the spectrum of services—discretionary spending represents the money Congress appropriates every year for everything from battleships to Head Start. The constitutional authority that allows Congress to make annual appropriations, however, has been weakened considerably.

Due to the growth of entitlement spending, the sector of government that Congress can readily get to from one year to another is no longer expanding. In fact, during the 1990s, it actually shrunk in real terms. In 1990, Congress put strict limits on appropriations, which have since been tightened even further, imposing a “hard freeze,” i.e., not allowing increases to keep up with inflation. That policy kept discretionary spending virtually flat through the rest of the decade. That means that there was not enough money to cover the same value of services the government previously provided, much less expand them. The proliferation of entitlement spending at the expense of discretionary

spending may potentially sacrifice the capacity of Congress to build new programs appropriate to changing national needs.

Environmental Ethics

Christine M. Reed

*School of Public Administration, University of Nebraska at Omaha,
Omaha, Nebraska, U.S.A.*

INTRODUCTION

Environmental ethics is a branch of applied philosophy that addresses arguments about the value of nature. The literature in environmental ethics is voluminous, reflecting various philosophical traditions and therefore different ways of approaching such questions as whether the source of value in “nature” is objective, subjective, or socially and culturally constructed; whether value in nature is human centered (anthropocentric) or centered outside the sphere of human welfare (non-anthropocentric); and whether value in nature for itself is based on the interests and/or rights of individual animals, or on the preservation of species and ecosystems as a whole.

THE INTRINSIC VALUE OF NATURE

Intrinsic value is the idea that nature has value in itself and not as a means to further ends. One form of the intrinsic value argument locates the source of value in the objective properties of nature, such as the characteristics of a landscape prior to human cultivation.^[1] A second, subjectivist, form of the intrinsic value argument locates the source of value in the attitudinal frameworks of individuals, in particular approval of nonmoral value-adding properties in virtue of which wild nature has intrinsic value. One example of a value-adding property is the property of being naturally evolved.^[2] These metaethical differences often lead to similar normative claims, such as the duty to preserve and restore wild nature. In *Respect for Nature*, Taylor introduces a related, but different, concept: the inherent worth of wild plants and animals of the Earth’s natural ecosystems. He argues that moral agents will respect nature only if they deem non-human living beings to be possessors of inherent worth, as distinct from their instrumental value.^[3]

ESTHETIC VALUE IN NATURE

Another justification for environmental protection is to prevent the loss of esthetic value. According to Allen Carlson, pristine nature has positive esthetic value,

while replacing it with human alterations degrades nature’s essential beauty. For Carlson the characteristics that humans find esthetically pleasing also make the natural world more understandable: its unity, order, and harmony.^[4] A somewhat different argument is that the natural landscape is more beautiful than an artistic representation of that landscape, because esthetic qualities exist more fundamentally in the natural objects making up the natural landscape than in the painting depicting them.^[5] Esthetic qualities associated with natural beauty are nevertheless similar to those qualities attributed to art objects: environments that are magnificent and rich, that present the viewer with new ways of perceiving, that have cultural significance because of a connection with the past, and that challenge the way people live or think.^[6]

ENVIRONMENTAL VIRTUE ETHICS

This approach to environmental ethics locates intrinsic value in the virtues of the moral agent, specifically in environmental virtues. One example of an environmental virtue is humility, the mean between human arrogance on the one hand which closes off an individual to the idea of self as part of nature, and false modesty on the other which leads the individual to lose all sense of individuality in the presence of nature’s vastness and sublimity. Seeing oneself as part of nature is related to other virtues, such as an esthetic sense and capacity for gratitude.^[7] The capacity for gratitude, like the moral intuition of esthetic value in nature, is anthropocentric to the extent that the locus of intrinsic value is in the person rather than in nature itself; however, environmental virtue ethics reflect concern for nature and consider its wanton destruction a vice. Environmental virtues are often reflected in environmental literature, such as *Walden*, in which Thoreau exemplifies temperance, integrity, sensibility to natural beauty, and simplicity.^[8]

ENVIRONMENTAL PRAGMATISM

Some theories about value in nature are based on pragmatism and reject the idea that the locus of value is

either in human consciousness *or* in an independent nature. “Weak” anthropocentrism distinguishes between individual felt preferences for commodities that are satisfied by a market transaction vs. considered preferences that reflect human value formation arising from the experience of natural objects.^[9] Another approach based on environmental pragmatism views understandings of nature as culture-laden linguistic descriptions or metaphors that reflect the human experience of nature, rather than nature as an external reality.^[10] A third contribution challenges the boundary between mind and body, arguing that human cognitive abilities emerge from sensory–motor structures (schema) developed through a process of evolution similar to that of non-human animals.^[11]

CIVIC ENVIRONMENTALISM

The term “civic environmentalism” means that a community has organized on its own, rather than in response to federal mandates, to protect its environment. It refers to a process of local, communal self-reflection, and recognition that certain environmental hazards, such as “non-point” source pollution of streams and rivers, are created over time by the social practices of an entire community.^[12] Environmental ethics and democratic values come together when citizens are motivated by civic virtue to become engaged in the political and ecological welfare of their communities. A related concept is that of “ecological citizenship” in which public participation in local restoration projects is part of a broader project of active engagement in the public affairs of the community. The “ground” of citizenship in modern times is found at the level of local ecology.^[13]

OBLIGATIONS TO FUTURE GENERATIONS

A second example of an approach to linking environmental ethics to democratic values is concern for intergenerational equity: what are the obligations of public officials and of society as a whole to make policy decisions in the present that protect life in the future? One answer is to extend the thought experiment of John Rawls and to imagine people behind a “veil of ignorance” who are establishing procedures for a just society, and who do not know either their economic and social status in society or their place in history. Under those conditions, people will agree to rules of social justice that consider the welfare of future generations.^[14] The scope of intergenerational ecological problems, such as global warming and loss of biodiversity, involves public administration and policy at the

international level, as well as intervention in the private market, to regulate in favor of future generations.^[15]

ENVIRONMENTAL DISCOURSE ETHICS

A third, more radical, way to balance environmental and political values is to maintain concern for processes of governance that are legitimate because they are based on principles of justice, while extending the moral community to include non-humans. Green reason is an extension of the ideal of communicative rationality to non-humans.^[16] It involves defining non-linguistic beings as capable of communication. It also insists that freedom from domination and distortion in human-to-human discourse be extended to interaction with nature. Just as the policy agenda is often dominated by a few powerful interest groups, so too are human representations of the world privileged representations from other marginal positions, especially animal species.^[17] Extending communicative reason to make it truly egalitarian and free from the distortions of political power entails the inclusion of non-human as well as human beings. Discourse, however, is also based on “affect-mediated interpretations” of the needs of non-human others. The “life world” is shared with nonlinguistic beings.^[18]

POSTMODERN ENVIRONMENTAL ETHICS

According to a postmodern approach to environmental ethics, nature is what humans have constructed through their own social practices. The primary ethical responsibility is to be aware of nature as a social construction and to make human relationships with the natural world more just and accountable.^[19] But the preservation of wild nature is an anachronism because “nature” as a reality independent of human or cultural intervention no longer exists. Lamenting the end of nature just serves as an excuse to avoid our responsibility for what society has constructed in both figurative and literal senses of the term. The blurring of the boundaries between the spheres of nature and culture is manifest in the fact that no wilderness areas are left in the United States, apart from some remote areas of Alaska. We are now custodians of a managed world and responsible for all its life forms.^[20]

CONCLUSION: EXPLORING THE LINKAGES

The vast majority of work in environmental ethics consists of various philosophical arguments for locating intrinsic value in natural objects, in the virtues of the moral agent, or in humans as part of nature. There is

a potential conflict between individual human rights and environmental ethics, particularly when environmental ethics are extended to include animals or even ecosystems. Conflicts between human and non-human rights can pit environmental ethics against democratic values; however, efforts to reconcile the two, such as civic environmentalism and environmental discourse ethics, reframe the meaning of democratic practice in a way that enlarges citizenship to include both engagement with government in the larger context of the ecological community, and engagement with non-human others as part of our social life world.

INTRODUCTION

Federal environmental policies center around three pieces of legislation: the Clean Air Act, the Clean Water Act, and the National Environmental Policy Act (NEPA). These acts enhanced federal involvement in environmental policy and established a system of command and control regulation of industry. However, by the late 1980s this emphasis on command and control regulation diminished as policymakers started to emphasize concepts of decreased federal involvement that could help control environmental pollution. Among these concepts were notions of cooperative frameworks between industry and government as well as the concept of organizations implementing environmental management systems to improve economic efficiency through better environmental performance.

This decreased federal involvement in environmental policy is nothing new. In fact, initial federal statutes regarding clean air and water policies did not rely on direct federal involvement. Rather, these statutes typically allowed states to set environmental standards with no federal guidelines. Beginning in the 1960s and 1970s, this began to change as the public increasingly became aware of environmental problems and the federal government realized states implemented environmental standards inconsistently. By briefly analyzing the historical development of federal environmental policies, this changing pattern of federal involvement in environmental policy becomes clarified.

CLEAN AIR POLICY

Before 1955, air pollution statutes were mainly state or local affairs. This started to change with the 1955 Air Pollution Control Act. In this act, the federal government provided states with funds to conduct air pollution research and train personnel.^[1] By 1963, this act was supplanted with the original Clean Air Act. The original Clean Air Act provided additional federal support for air pollution research, funded the development of state pollution control agencies, and allowed

the federal government to assist states when issues of interstate air pollution occurred.^[1] Although significant, these acts represented indirect federal involvement in air pollution policy.

Direct federal involvement began in 1967 with the passage of the Air Quality Act. This act required states to use federal research on air pollutants to develop air quality standards for areas with major air-pollution concerns.^[1] Unfortunately, many states did not develop air quality standards by the time the act expired in 1970.^[1] This set the stage for the 1970 amendments to the Clean Air Act; what many refer to when speaking of the Clean Air Act. Under these amendments, the federal government established national ambient air quality standards (NAAQS) for major air pollutants from stationary sources, states were given responsibility for implementing air pollution plans within federal guidelines, and both the federal and state governments enforced these plans on industrial polluters.^[2] These NAAQS represented the maximum concentration of common air pollutants permitted and were divided into primary standards protecting human health and secondary standards protecting forests, agricultural products, and buildings.^[3]

Further amendments to the Clean Air occurred in 1977 and 1990. Most significantly, the 1977 amendments formally added the prevention of increased air pollution in areas such as national parks or forests having minimal air pollution concentrations below NAAQS.^[4] The 1990 amendments included provisions that established new emission standards for mobile sources of air pollution, phased out certain ozone depleting chemicals, and created a program of emissions trading for sulfur oxides.^[2] Of particular interest, policymakers implemented the sulfur oxide trading program as a way to reduce command and control regulation of industry. Although the federal government was still actively involved in this program, it represented a move back to indirect federal involvement in clean air policy.

In 1955, federal clean air policy began as a program of grants to states for research and training. However, by 1970 federal clean air policy had evolved to a command and control system attempting to reduce certain types of air pollutants. This evolution of

environmental policy occurred because of increasing public concern over environmental issues and an increasing awareness by the federal government that most states would not implement air pollution standards without compulsion from the federal government.^[2] By 1990, political influences forced parts of this direct federal approach back to a more indirect approach, yet command and control regulations still constituted the majority of federal air pollution policy. A similar progression of federal involvement in environmental policies can also be observed in clean water policy.

CLEAN WATER POLICY

Federal involvement in controlling water pollution technically commenced with the Refuse Act of 1899. In an attempt to ensure navigable waterways, this act prohibited the discharge of waste such as sludge and sawdust into navigable waterways without a federal permit.^[5] However, federal legislation emphasizing the improvement of water quality for purposes other than navigation began with the Water Pollution Control Act of 1948. In keeping with the prevailing view of the time, this act emphasized indirect federal involvement in controlling water pollution. Specifically, the act gave the federal government authority to conduct research on water pollution and to establish a loan program for municipalities wishing to construct municipal sewage treatment facilities.^[5] This act was amended in 1956. The 1956 amendments created a federal grant program for municipalities constructing sewage treatment facilities and established the concept of holding conferences to determine who should clean up interstate water pollution.^[5] However, because these statutes did not implement water quality or effluent standards and because the conference concept proved to be unworkable, these statutes were unsuccessful in controlling water pollution.

The Water Quality Act of 1965 had water quality standards. In this statute, states were required to develop water quality standards for interstate waters within state borders and determine the maximum discharge allowed into these interstate waterways.^[3] However, as in controlling air pollution, states did not consistently implement or enforce these standards. Consequently, direct federal involvement in water pollution policy came in 1972 with the Federal Water Pollution Control Act. This act established federal standards for point source (i.e., industrial or commercial) discharges of conventional water pollutants based on available technology, gave the federal government initial responsibility for enforcing those standards on individual polluters within a certain time period (states

could take over this enforcement duty at a later time), and expanded the federal grant program for municipalities constructing sewage treatment facilities.^[6]

Further changes to clean water policy occurred in 1977 when Congress passed the Clean Water Act. This act delayed some of the deadlines included in the 1972 statute for establishing technology-based effluent standards for individual dischargers and added effluent limits on toxic pollutants.^[7] Changes occurred again when Congress passed the Water Quality act in 1987. This act further postponed deadlines for establishing technology-based effluent standards, required states to implement plans for controlling non-point sources of water pollution such as runoff from agricultural land and urban areas, and reduced the amount of federal aid available to municipalities constructing sewage treatment facilities.^[5]

Over time, federal involvement in water pollution increased because of state inconsistencies in controlling water pollution. However, by the late 1980s the prevailing political environment contributed to a decrease in federal involvement in clean water policy. This decreased federal involvement resulted in a reduced federal grant program for the construction of municipality sewage treatment facilities and the continued delay of establishing technology-based effluent standards for industry and businesses. During this time, policymakers started to advocate approaches to pollution control in which the organization voluntarily assessed environmental impacts. Ironically, policymakers first introduced the concept of organizations assessing environmental impact in the late 1960s with the NEPA.

THE NATIONAL ENVIRONMENTAL POLICY ACT

In contrast to the extended histories surrounding the Clean Air Act and the Clean Water Act, policymakers designed NEPA legislation within one year and passed it into law at the beginning of 1970. The most significant provisions of NEPA required federal agencies to assess the environmental impact of programs before implementation and submit environmental impact statements for programs impacting the environment.^[8] An important provision of NEPA was increased citizen participation. Under the NEPA process, community groups could challenge the adequacy of an agency's initial environmental impact statement.^[9] In response to these challenges, agencies often changed program designs or designed final environmental impact statements reflecting citizen concerns.

While focusing on federal agencies, NEPA introduced the concept of assessing environmental performance at the organizational level. This organizational

idea of assessing environmental performance later became an emphasis of environmental management systems in the 1980s and 1990s. In environmental management systems, organizations voluntarily measure significant environmental impacts due to operations.^[10] Consequently, organizations can use environmental management systems to ensure compliance with current federal regulations regarding pollutant discharges and also to focus on environmental issues not currently regulated such as the sustainability of natural resources.

Environmental management systems allow the organization to focus on improving environmental performance. Although the success of environmental management systems in decreasing environmental impacts has still not entirely been proven, the voluntary standard adopted by organizations using these systems represents a further reduction in federal involvement in environmental policy. As environmental policy progressed through the 1980s and 1990s this trend of reduced federal involvement became increasingly apparent in statutes dealing with clean air and clean water.

CONCLUSION

During the 1960s and 1970s, environmental policy at the federal level shifted from a system of indirect federal management regarding such issues as air and water pollution to a more direct system emphasizing command and control regulation. Generally, these command and control regulations focused on industrial causes to pollution and required the federal government to define pollution standards while state governments designed plans to achieve those standards. The passage of legislation such as the 1970 amendments to the original Clean Air Act and the 1972 Federal Water Pollution Control Act exemplified this command and control process. These acts, along with their numerous amendments through the years, resulted in a dramatic increase in air and water quality.^[11]

While command and control regulations improved air and water quality, other environmental problems such as the depletion of natural resources and non-industrial sources of pollution persisted. To address these types of problems falling outside of the command and control process, environmental policy in the 1980s and 1990s increasingly emphasized strategies of pollution prevention rather than pollution reduction.^[12] Reflecting political concerns over the economic costs of direct federal involvement and a technical challenge of establishing national standards for less common pollutants, these pollution prevention strategies shifted federal environmental policy back to a more indirect

involvement. Typically, this indirect strategy relied on businesses and governmental agencies to engage in cooperative frameworks that often adopted voluntary standards of pollution prevention.^[12] In addition, this strategy also emphasized the notion of businesses adopting environmental management systems, often independent of any governmental incentive, in order to increase efficiency by decreasing negative environmental impacts.^[10]

These strategies of direct and indirect federal involvement currently comprise environmental policy. Command and control regulations implemented in the 1960s and 1970s operate with more voluntary standards emphasized in the 1980s and 1990s in an attempt to improve environmental quality. When operating together, both strategies may significantly improve many aspects of the environment. Nevertheless, the historical pattern of environmental policy development suggests that federal involvement in environmental policy will continue to vary to reflect new political trends and emerging technical challenges.

ACKNOWLEDGMENTS

I would like to thank Dr. Paul Culhane of Northern Illinois University and Dr. Patrick Stewart of Arkansas State University for providing thoughtful guidance on environmental policy.

Environmental Pollution Control, State Government Administration of

A. Hunter Bacot

*Department of Political Science, University of North Carolina at Charlotte,
Charlotte, North Carolina, U.S.A.*

INTRODUCTION

Since 1980, state governments have assumed much responsibility for environmental program administration. Administrative responsibilities of states for pollution control policies are crucial to national environmental initiatives to prevent or contain pollution. Therefore, the management of pollution control policies is conducted primarily by states, and environmental affairs continue to be national priorities that rely on states for administration and implementation.

Environmental administration in the United States is generally distinguished according to media—air, water, and waste are the three generally accepted environmental arenas. Concerning pollution control, states enjoy significant latitude for monitoring and enforcement of air and water pollution control policies. National air and water regulations delegate administrative responsibilities to states based on each state's ability to perform these regulatory functions.^a State environmental agencies given responsibility for implementing administrative and enforcement provisions of national air and water policies have primacy [i.e., the state has primary responsibility for environmental management in the state, although the Environmental Protection Agency (EPA) oversees state management]. To date, nearly every state has full or partial authority from the EPA to control air and water pollution within their respective borders.

Three national legislative efforts (and subsequent reauthorizations)—the Clean Air Act (CAA), the Clean Water Act (CWA), and the Safe Drinking Water Act (SDWA)—provide states with much of the responsibility for regulating air and water pollution. This delegation of authority is examined in this article. Major provisions of air and water legislation, the degree to which states assume control of the administration of these legislative acts, and how well states fare in controlling pollution are also reviewed.

DELEGATING REGULATORY AUTHORITY TO STATES FOR POLLUTION CONTROL

States having primacy over environmental policies and programs must meet criteria established by the EPA to manage pollution control within their borders. The EPA has ultimate authority over all pollution control programs in the United States, and thus approves whether states are able to manage their own environmental situations. To acquire primacy status from the EPA, states must adhere to guidelines of the EPA (as stated in acts governing pollution) and receive the agency's approval for managing pollution control programs.

The CAA, CWA, and SDWA provide significant administration and implementation responsibilities to states for air and water pollution control. To demonstrate the capacity to enforce national laws within their borders, states initially submit required biennial reports to the EPA discussing state environmental laws, which cannot be less stringent than the national laws, and how these laws support national environmental legislation. States must demonstrate to the EPA the ability to accept many of the permitting, administrative, and enforcement provisions contained in national laws.

To demonstrate an ability to accept environmental management responsibilities (i.e., to attain primacy), states must submit state implementation plans to the EPA. State implementation plans explain to the EPA how state regulations serve national interests with regard to environmental pollution control. State implementation plans are involved, providing detailed explanations about a state's ability to oversee environmental management programs and policies within its borders. They include information about pollution control legislation, state agency information, due process procedures (hearings, comment periods, appeals, etc.), enforcement capabilities, etc. The EPA must approve the state implementation plan, or it can authorize the state to administer environmental policies on a limited or partial arrangement until approval of the state's state implementation plan is granted. Full authorization or delegation gives states full control of environmental programmatic responsibilities. In the year 2002, most states had primacy for most major environmental programs (see [Table 1](#)).

^aIn addition to the public laws detailing these responsibilities, much of the following discussion draws generally from a host of excellent sources discussing the administration of environmental programs (see Refs. [1–11]).

Table 1 State pollution control status for selected air and water acts

Primacy status	Selected air acts (number of states)					Selected water acts (number of states)		Selected drinking water acts (number of states)	
	NSPS	NES HAPS	PSD	Title V	NSR	NPDES	P	PWSS	WPP
Full program delegation or authorization	40	39	14	17	0	38	31	49	15
Partial program delegation or authorization	8	9	3	0	1	4	0	0	0
Program delegation or authorization is approved, pending, or in interim status	1	2	33	28	43	0	1	0	21
Not delegated or not subject to delegation	1	0	0	5	6	8	18	1	14

Notes: For the CAA: State-delegated responsibilities for the CAA includes state authority to administer the following components of the act, and include the New Source Performance Standards (NSPS; deals with emission standards performance testing and compliance), National Emission Standards for Hazardous Air Pollutants (HAPS), Prevention of Significant Deterioration (PSD; ensures that areas subject to provisions of the National Ambient Air Quality Standards are not declining), Title V Operating Permit authority, New Source Review (ensures continued compliance with air standards according to air standards permitting base on best available control technology). For the CWA: State-delegated administrative responsibilities for the CWA includes state authority to administer the National Pollution Discharge Elimination System (NPDES; governs point source discharges) and pretreatment programs for publicly owned treatment works facilities (P; governs effluents treated at treatment plants before discharge, and directed at non-point source treatment). For the SDWA: Safe Drinking Water Act (SDWA; governs drinking water quality), which is a separate act from the CWA, has delegable components for ensuring water quality for consumption; here we are interested in ensuring safe drinking water and water supply, which are specified in the SDWA as the Public Water System Supervision (PWSS; publicly operated water systems) and the Wellhead Protection Program (WPP; protects public water supply wells from contaminants).

Source: Author, Refs.^[19] and ^[20].

Upon acquiring authorization to administer their own programs, states and the EPA remain partners in pollution control. The EPA supports states through the administration of millions of dollars in grants, and provides additional assistance to states through research, technology, and technical support. If states fail to adhere to pollution control strategies stated in their state implementation plans, the EPA can rescind state authorization for administering environmental programs (which rarely occurs). Thus, although most states currently administer their “own” state environmental programs, continuing administration of national initiatives depends on a state’s administrative capacity, as so deemed by the EPA, to accept this responsibility.

AIR POLLUTION CONTROL REGULATIONS

Provisions in the CAA, which was originally passed in 1972 and subsequently amended and reauthorized, guide cooperation on policies affecting air quality in the United States. The CAA initially regulated air quality standards of pollutants. CAA amendments furthered air regulations to include air toxins, acid rain, and local air quality attainment, which expanded the agency’s responsibility for improving air quality.

The original CAA listed only a few contaminants and established national emissions standards for hazardous air pollutants (NESHAP). The NESHAP increased air pollution regulations by addressing commercial and industrial air pollutants (e.g., asbestos, mercury, benzene).

In 1990, subsequent amendments to the CAA increased the roles of states; provisions of the act mandate state participation in the administration of environmental programs. The amendments also require states to prepare state implementation plans (SIPs), which force states to submit to the EPA an “inventory” of their progress in reducing air pollution. Congress also increased the number of regulated pollutants, which, because most states have attained primacy status, gives states additional regulatory and administrative responsibility for air pollution. The amendments also identify new areas of regulation to control releases contributing to acid rain and ozone depletion (among others), define urban non-attainment areas, and identify a host of contaminants, as well as acceptable emission levels for each contaminant.

Generally, states are given reasonable responsibility for establishing acceptable emission levels (in their SIPs). States must account for their performance by tracking emission levels of chemical sources, as well as other new sources identified through increased technological capacity. New emission regulations

determine areas that have poor air quality, as well as areas that meet ambient air recommendations (which are established using technologically driven analysis based on “best available technology” or other technological criteria). As technological capacity constantly reveals previously undetectable elements, states that meet their specified standards must continually monitor the status of air pollutants, which is noted in biennial pollution reports required by the EPA.

As is evident in testing standards and monitoring responsibilities, states’ assumption of programmatic responsibility for air quality is an arduous assignment. Most states have prospered with program primacy because only a few do not have some program responsibilities delegated (see Table 1). Environmental management of air quality is a continuous, challenging task that is but one of the primary environmental media demanding attention by state environmental agencies.

WATER POLLUTION CONTROL REGULATIONS

An equally demanding area of emphasis for state environmental administrators is surface water quality (e.g., rivers, lakes) and underground water quality (e.g., wellhead protection, aquifers). Like air quality, water quality standards are guided by national legislation—the CWA and its subsequent amendments, and the SDWA—and are generally implemented at the state level. Improved water quality is realized by regulating discharges from industrial, commercial, and municipal (ICM) facilities, as well as non-point sources and stormwater systems.

Water quality pollution control is managed by controlling effluents discharged into regulated waters and protecting drinking water sources. Based on treatment standards and effluent lists, states create ambient water quality standards for ICM facilities that discharge conventional pollutants and non-conventional pollutants into surface waters. Conventional pollutants are discharges that deplete or disturb natural elements and/or the balance of elements, whereas non-conventional pollutants are airborne or leachate pollutants that originate elsewhere and migrate or settle in bodies of water and/or area water supplies.

Similar to most laws regulating pollutants, sections of the CWA provide specific guidelines to the EPA for managing water quality and returning programmatic responsibilities to states. States, with EPA oversight, implement most of the provisions set forth in the CWA. Also specified in the CWA are water quality standards based on the type and use of waters—whether recreational, sporting, or serving as a water

supply, etc.^b States classify bodies of water in accordance with standards required for maintaining the classified use. Common classifications of water types and uses organize waters based on exceedances of the specified minimums for stated categories, according to national definitions, as well as designate certain pristine waters as protected.

Drinking water pollution control is another area of significant responsibility for state agencies, and is governed by the SDWA. Drinking water pollution is caused by the contamination of water supplies. Effluents migrating from offsite locations, whether to an aquifer, to wellheads, or generally into the water table, contaminate water supplies. States protect water supplies by establishing standards (based on national standards), distinguishing among source uses (agriculture, drinking water, etc.), and controlling non-point threats. Determination of water quality regulations becomes states’ responsibility, as water sources, uses, and threats vary widely across states.

The CWA amendments give states responsibility of the permitting process for the National Pollutant Discharge Elimination System (NPDES). The EPA maintained responsibility of pollution discharges until 1987, when responsibility was delegated to states for establishing effluent levels and granting discharge permits. The NPDES regulates direct discharges, or point source discharges into surface waters. National standards guide states in determining allowable discharges and the water quality of water bodies that accept discharges. Facilities discharging effluents into surface waters must have a permit from the state, which grants these facilities permission to discharge effluents into affected surface waters within allowable limits (as established by the EPA).

Over time, states have demonstrated the ability to manage water quality programs. In fact, approximately one-half of the 50 states administer comprehensive water protection programs. Although difficult, states are assuming responsibilities for administering programs to protect and preserve water quality.

STATE PROGRESS IN AIR AND WATER POLLUTION CONTROL

From most perspectives, states have succeeded in controlling air and water pollution in the United States. Yet, despite the successes of environmental

^bCategories are classified based on water quality that supports recreational uses by people (class A); ecological integrity and natural habitation (class B); water supplies for public consumption (class C); and industrial, commercial, and agricultural activities (not intended for consumption) (class D).

management in the United States, as Rosenbaum observed, “the nation’s air and water remain seriously polluted.”^[12] Without legislation and policies directed at controlling air and water pollution, however, the situation would likely be much worse. Thus, overall, states’ efforts to reduce pollution in our air and water systems are deficient, and although there are improvements in curbing air and water pollution, most improvements are based on seriously limited assessment information.

Under the direction and guidance of the EPA, states have shown progress in cleaning air, water, and drinking water supplies since the 1980s. Air pollution policies enforced by states reveal improvement in air quality throughout the United States. This success in managing pollution is achieved despite regulations governing approximately 200 pollutants, which is a dramatic increase in the number of regulated elements from the original legislation enacted in 1970. Of the six criteria pollutants,^c each has decreased from 1989 levels. In fact, four of these six pollutants decreased between 25% and 56% (Ref.^[13]; Table A-9). There are other areas, namely ozone, in which states continue to encounter difficulty in achieving established reduction goals; another area of special importance to states is air quality in rural areas, which is lagging compared with established goals.^[13]

Water quality trends have improved dramatically since 1970, with the enactment of the CWA and subsequent amendments to the act. Improvements in water quality are based on available information, which is woefully inadequate as only approximately one-third of all water bodies have been assessed to determine pollution levels. For example, only 23% of rivers, 42% of lakes, and 32% of estuaries have been assessed to determine surface water quality in the United States.^[14] Of water bodies assessed by states, however, there are indications of improvements in water quality. In fact, “states reported that 65 percent of assessed river and stream miles, 55 percent of assessed lake acres, and 56 percent of assessed estuarine square miles fully support the water quality standards states evaluated.”^[14] As a result, water quality is improving across the states, although this judgment is based on limited information.

Drinking water and groundwater are two other areas involving water quality assessments in states. Although states find overall groundwater quality acceptable, there are measurable problems with contamination from nearby sources, such as underground storage tanks, landfills, septic tanks, etc.^[14] Based on state reports, groundwater quality has improved in

recent years and continues to support major uses of groundwater resources.^[15] As tremendous strides in assessing groundwaters are made, significant deficiencies in coverage remain.^[15] Safe drinking water is probably the success story for states aspiring to improve water quality. Although challenged to provide safe drinking water to all citizens, states—armed with provisions of the SDWA—have improved the quality of drinking water since the 1980s.^[16] As improvements are made in the “testing, treatment, protection, and provision of drinking water to the public,” challenges remain as technology continues to advance the ability to track and detect elements in smaller quantities.^[16]

STATE PROGRESS IN MONITORING AND ENFORCEMENT OF POLLUTION CONTROL POLICIES

Although states appear to be making progress in controlling pollution within their borders, the overall picture of states’ progress in this area is formidable. States made significant progress in controlling pollution on identified sources or assessed sources. However, because identified or assessed sources comprise only a small percentage of pollution threats, much is not assessed or identified by state agencies charged with managing pollution. It is information about “the unknown” that should concern citizens of each state.

According to the EPA’s Office of Inspector General, “air enforcement audits disclosed fundamental weaknesses with state identification and reporting of significant violators of the Clean Air Act.”^[17] Similar findings plague efforts to control water pollution. Another EPA report submitted “that state enforcement programs could be much more effective in deterring non-compliance with discharge permits and, ultimately, improving the quality of the nation’s water.”^[18] States lag significantly in addressing pollution control problems for all contaminant threats to the nation’s air and water. Analysis of state efforts in air and water program enforcement and monitoring suggests states are woefully deficient and, if advances in controlling pollution are to occur, states must improve their efforts, or pollution sources will remain unchecked.

States, therefore, must improve their pollution enforcement and monitoring programs, as well as assessment programs affecting all water bodies and air quality. However, the within-state challenges most states face make improvement extremely difficult and, as a result, unlikely. Most states have improved their pollution control programs dramatically since the 1980s, but these improvements have not kept pace with the increasing program demands required with program primacy. Pollution control for states is proving a

^cCriteria pollutants are carbon monoxide, lead, nitrogen dioxide, ozone, particulate matter, and sulfur dioxide.

Sisyphian task that, despite ample progress, has states struggling to keep up with program requirements.

CONCLUSION

As states continue to cite gains in the quality of air and water by acquiring data necessary to establish current dispositions, more must be known about the true threat of pollution; this is particularly important as information continues to improve knowledge of states' environmental situations. States are continually increasing their capacity to monitor air and water quality, but advances are slow, deliberate, and costly, which imposes considerably on state resources. Accordingly, although states show some success in mitigating pollution, as the analytical capabilities continue to improve with science and technology, states will continually confront new areas of environmental need that commands their attention. More troublesome for states (and citizens) are that many problems remain undetected, and thus may not be recognized until conditions deteriorate to a level unable to support intended uses.^[15] As a result, there can be no celebration of state environmental successes, only brief recognition of these successes. The battle to control air and water pollution is daunting and progress in assessment, monitoring, and enforcement must improve dramatically if pollution is to be curtailed and contained.

Equal Employment Opportunity and Affirmative Action

Norma M. Riccucci

*School of Public Affairs and Administration, Rutgers University, Newark Campus,
Newark, New Jersey, U.S.A.*

INTRODUCTION

Equal employment opportunity (EEO) is largely viewed as a means to prevent discrimination in the workplace. Title VII of the Civil Rights Act of 1964, for example, as amended, is intended to prevent discrimination on the basis of race, color, religion, gender, and national origin in public and private sector workforces. Affirmative action, however, which emerged in response to pervasive employment discrimination, embodies proactive efforts to redress past discriminations and to diversify the workplace in terms of race, ethnicity, gender, age, physical abilities, and so forth. Affirmative action has been viewed as a legal tool to ensure EEO or diversity (see [Table 1](#) for comparison of the concepts).

EMPLOYMENT DISCRIMINATION AND THE EVOLUTION OF EEO

Although there were a handful of early efforts to combat employment discrimination in our society, it was not until the 1960s that this nation, spurred by racial unrest, was galvanized into taking genuine action to end discriminatory employment practices. In 1964, Title VII of the Civil Rights Act, which is the cornerstone of EEO law in the United States, was passed. Title VII was intended to prevent private sector employers, with 15 or more employees, from discriminating on the basis of race, color, religion, gender, and national origin.^[1] Today, there are numerous statutes, executive orders, and policies in place that are intended to combat employment discrimination in the workplace. [Table 2](#) illustrates the major EEO laws and policies that have been advanced since the reconstruction era. As can be seen, Title VII of the Civil Rights Act was extended to public employers with passage of the Equal Employment Opportunity Act in 1972. It is this act, along with provisions of the U.S. Constitution (e.g., the Fourteenth Amendment) and its enforcing legislation (Sections 1981 and 1983 of the Civil Rights Acts of 1866 and 1871, respectively), that is the primary legal mechanism geared to protect women and people of color from employment discrimination in the public sector.^[2]

As with race, ethnicity, and gender, employers are also prohibited from discriminating against persons on numerous other dimensions or characteristics, including age and ability. For example, the ADEA of 1967 makes it illegal for private businesses to refuse to hire, to discharge, or to otherwise discriminate against an individual between the ages of 40 and 70. The act was amended in 1974 to apply to state and local governments. Age discrimination in federal employment is prohibited by executive order, but additional amendments to the ADEA banned forced retirement for federal employees at any age. Enforcement authority over the ADEA was originally vested in the Department of Labor, but was transferred to the Equal Employment Opportunity Commission as part of the federal civil service reform of 1978.

There are also various laws that prohibit discrimination on the basis of a disability. For instance, the Vocational Rehabilitation Act of 1973, as amended, prohibits discrimination against persons with disabilities. These protections were strengthened by Title I of the ADA of 1990, which covers private sector employers as well as state and local government employers with 15 or more employees. The federal workforce, which is not protected by the ADA, continues to be covered by the Rehabilitation Act of 1973. An important aspect of the ADA is that it covers persons who are HIV positive or have AIDS.

FROM EEO TO AFFIRMATIVE ACTION

EEO law is considered to be passive in the sense that it requires employers to refrain from discriminating against protected-class members (i.e., those designated for protection by the specific EEO legislation). Affirmative action, however, requires employers to take positive steps toward employing, promoting, and retaining qualified women, people of color, and other protected-class persons (see description of Executive Order 11246, as amended, in [Table 2](#)). Not only would this help to rectify past and present discrimination, but also would help to create “representative bureaucracies”—that is, government bureaucracies that are demographically representative of the general populations they serve. Because affirmative action is based on proactive

Table 1 Comparing EEO and affirmative action

EEO	Affirmative action
<i>Qualitative/quantitative</i> : emphasis on preventing or ending discrimination	<i>Qualitative/qualitative</i> : emphasis on redressing past discrimination and achieving diverse, representative workforces
<i>Legally driven</i> : Mandated by federal law	<i>Managerially and legally driven</i> : involves voluntarily developed goals and court-ordered programs; common law has defined its legality and constitutionality
<i>Fairness</i> : seeks to end discrimination and create equal opportunities	<i>Remedial and compensatory</i> : specific target groups benefit as past and present wrongs are remedied
<i>Access model</i> : model assumes that protected-class persons will be able to access organizations	<i>Assimilation model</i> : assumes that persons and groups brought into the system will adapt to existing organizational norms; can result in “sink or swim” atmosphere/environment
<i>Level playing field</i> : seeks to ensure equal opportunity and access	<i>Opens doors</i> : seeks to affect hiring and promotion decisions in organizations

(Adapted from Ref.^[2].)

Table 2 Federal EEO law

Law/policy	Provisions/coverage
Civil Rights Act of 1866, Section 1981	Provides that “all persons shall have the Same right . . . to the full and equal benefit of the laws . . . as is enjoyed by white citizens”
Fourteenth Amendment to U.S. Constitution (1868)	Requires all states and their political subdivisions to provide equal protection of the laws to all persons in their jurisdictions
Civil Rights Act of 1871, Section 1983	Prohibits persons acting “under color of any statute, ordinance, regulation, custom or usage . . .” from depriving any citizen or person within the jurisdiction of the United States of any rights, privileges, or immunities secured by the Constitution
Ramspect Act 1940	Prohibits discrimination in federal employment based on race, color, or creed
Executive Order 8802 (1941)	Called for the elimination of discrimination based on race, color, religion, or national origin with the federal service and defense production industries
Civil Rights Act of 1964, Title VII	Prohibits discrimination on the basis of race, color, religion, and national origin
Executive Order 11246, as amended (1965)	Forbids employment discrimination based on race, color, religion, gender, and national origin by federal government and federal contractors and subcontractors and requires the federal government and contractors to engage in affirmative action to hire and promote persons based on these characteristics
Age Discrimination in Employment Act (ADEA), as amended (1967)	Forbids employment discrimination based on age
Equal Employment Opportunity Act of 1972 (amends Title VII of CRA of 1964)	Extends Title VII protection to state, local, and federal government employees and workers in educational institutions
Vocational Rehabilitation Act of 1973	Prohibits federal government and its contractors from discriminating against persons with disabilities
Vietnam Era Veterans’ Readjustment Act of 1974	Requires the federal government and its contractors to promote employment opportunities for Vietnam-era veterans
Americans with Disabilities Act (ADA) of 1990	Forbids private, state, and local government employers from discriminating on the basis of disability
Civil Rights Act of 1991	Overtured several negative U.S. Supreme Court decisions issued in 1989 on EEO and affirmative action and established a Glass Ceiling Commission to study the artificial barriers to the advancement of women and persons of color in the workplace

efforts, it has led to myriad lawsuits challenging its legality and constitutionality. In fact, one of the first legal challenges, *Regents of the University of California v. Bakke* (1978), argued that affirmative action resulted in “reverse discrimination.”^[3] In *Bakke*, the U.S. Supreme Court upheld, for the first time, the legality of an affirmative action program, when it ruled in favor of a flexible admission program of the University’s Medical School, which took race into account as a criterion for admissions.

A Snapshot of Affirmative Action Case Law

Since the U.S. Supreme Court issued its *Bakke* decision in 1978, it has upheld affirmative action in various forms, at least through 1989 (see Table 3). Beginning in that year, the High Court issued several decisions, which proved detrimental to both EEO and affirmative action efforts. In response to these regressive rulings, the U.S. Congress passed the Civil Rights Act of 1991, which reversed these rulings, restoring the use

Table 3 Key U.S. Supreme Court actions or decisions on affirmative action

1978	<i>Regents of the University of California v. Bakke</i> . U.S. Supreme Court upholds the principle of affirmative action but strikes down its operation by the University at California under the Fourteenth Amendment and Title VI of the Civil Rights Act of 1964
1979	<i>United Steelworkers of America v. Weber</i> . U.S. Supreme Court upholds legality of voluntarily developed affirmative action plan under Title VII of Civil Rights Act of 1964
1980	<i>Fullilove v. Klutznick</i> . U.S. Supreme Court upholds constitutionality (under Fifth and Fourteenth Amendments) of federal set-aside programs enacted by the U.S. Congress
1984	<i>Firefighters Local Union and Memphis Fire Department v. Stotts</i> . U.S. Supreme Court upholds, under Title VII of the Civil Rights Act, as amended, the use of a seniority system in layoff decisions, despite its negative impact on affirmative action
1986	<i>Wygant v. Jackson Bd. of Ed.</i> U.S. Supreme Court strikes down, under the Fourteenth Amendment to the U.S. Constitution, the use of affirmative action in layoff decisions
1986	<i>Sheet Metal Workers’ International Association v. EEOC</i> . U.S. Supreme Court upholds, under Title VII and Fifth Amendment to the U.S. Constitution, a court-ordered affirmative action program to remedy past discrimination by a union and apprenticeship committee against people of color
1986	<i>Int’l Assoc. of Firefighters v. City of Cleveland</i> . U.S. Supreme Court upholds, under Title VII, affirmative action consent decree that provided for the use of race-conscious relief in promotion decisions
1987	<i>Johnson v. Transportation Agency, Santa Clara County</i> . U.S. Supreme Court upholds, under Title VII, voluntarily developed affirmative action program intended to correct gender and racial imbalances in traditionally segregated job categories
1987	<i>U.S. v. Paradise</i> . U.S. Supreme Court upholds, under the Fourteenth Amendment to the U.S. Constitution, a court-ordered affirmative action plan aimed at remedying discrimination against African-Americans in hiring and promotion decisions in Alabama Public Safety Department
1989	<i>City of Richmond v. Croson</i> . U.S. Supreme Court strikes down the constitutionality, under the Fourteenth Amendment, of a local government’s set-aside program because it could not satisfy the criteria of the strict scrutiny test
1989	<i>Martin v. Wilks</i> . U.S. Supreme Court allowed White firefighters to challenge, under Title VII, a consent decree, to which they were not a party, years after it had been approved by a lower court
1995	<i>Adarand v. Peña</i> . U.S. Supreme Court rules that the Equal Protection Clause of the Fifth Amendment requires that racial classifications used in federal set-aside programs must undergo strict scrutiny analysis
1996	<i>Hopwood v. State of Texas</i> . U.S. Supreme Court let stand a ruling by the U.S. Court of Appeals for the Fifth Circuit, which struck down the constitutionality of an affirmative action program at the University of Texas Law School
1999	<i>Lesage v. Texas</i> . U.S. Supreme Court throws out a reverse discrimination suit filed under the Equal Protection Clause of the Fourteenth Amendment against the University of Texas’ Department of Education
2003	<i>Grutter v. Bollinger</i> . The U.S. Supreme Court upheld affirmative action at the University of Michigan’s Law School under the Fourteenth Amendment, arguing that there is a compelling state interest in “racial diversity”. Race was one factor considered among many other factors
2003	<i>Gratz v. Bollinger</i> . The U.S. Supreme Court struck down the use of affirmative action in the University of Michigan’s undergraduate program under the Equal Protection Clause of the Fourteenth Amendment and Title VI of the Civil Rights Act. The Court stated that the program was based on a formula or “quota” system, giving extra points for race

of EEO and affirmative action to their pre-1989 legal status (see Table 4). In 2003, the U.S. Supreme Court again issued a landmark ruling in *Grutter v. Bollinger*, which upheld the use of affirmative action.^[4]

The *Grutter v. Bollinger* case involved the constitutionality of an affirmative action program at the University of Michigan's Law School. In a 5-4 ruling, the court majority opined that the racial diversity of a study body can be a sufficiently compelling interest on the part of a state university to warrant its use of racial preference in its admissions decisions. The court ruled that the Equal Protection Clause allows for the "Law School's narrowly tailored use of race in admissions decisions to further a compelling interest in obtaining the educational benefits that flow from a diverse student body" (on page 4 of Ref.^[4]).

In a second case, *Gratz v. Bollinger*, the Supreme Court, in a 6-3 decision, struck down the use of affirmative action in admission decisions at the University of Michigan's undergraduate programs in the College of Literature, Sciences, and Art.^[5] This program awarded 20 points on a scale of 150 for membership in an "underrepresented minority group"—African-Americans, Latinos, and American-Indians—with 100 points guaranteeing admission. In ruling that the

program violated the Equal Protection Clause of the Fourteenth Amendment, the court ruled that the program was "not narrowly tailored to achieve respondents' asserted compelling interest in diversity . . . [and] the policy does not provide . . . individualized consideration" of each characteristic of a particular applicant (on page 246 of Ref.^[5]).

In short, the court would not accept an affirmative action program in the form of numerical ratings. Thus, if affirmative action programs serve a compelling state interest (e.g., to promote diversity) and are sufficiently narrowly tailored (e.g., are not based on point systems) the court is likely to uphold their use.

THE FUTURE OF EEO AND AFFIRMATIVE ACTION

Although it is unlikely that EEO laws would be repealed at this point in time, the degree to which courts are willing to enforce the laws can vary. Indeed, as the U.S. Supreme Court continues to promote its policy of "federalism," whereby the court upholds the sovereignty rights of the states, protecting them from unnecessary or unwarranted intrusion by the

Table 4 The Civil Rights Act of 1991 overturns the U.S. Supreme Court's 1989 decisions

Case	Supreme Court ruling	Civil Rights Act of 1991
<i>Wards cove packing co. v. Atonio</i> (Title VII)	Plaintiffs must show that adverse was intentional, i.e., that the employment practice resulting in disparities was used not out of business necessity, but for illegal reasons	Plaintiffs required to demonstrate adverse impact. Employer must then "demonstrate that the challenged practice is job-related for the position in question"
<i>Patterson v. Mclean Credit Union</i> (42 USC Section 1981)	42 USC Section 1981 of the Civil Rights Act of 1866 is limited to hiring and some promotion decisions but does not extend to harassment on the job, discriminatory firing, or other post-hiring conduct by the employer	42 USC Section 1981 of the Civil Rights Act of 1866 covers all forms of racial bias in employment
<i>Martin v. Wilks</i> (Title VII)	White male firefighters can challenge, without time limitations, affirmative action consent decrees settling employment discrimination dispute, even if they were not original parties to the consent decree	The act prohibits challenges to consent decrees by individuals who had reasonable opportunities to object to the decrees
<i>Lorance v. At&t</i> (Title VII)	Women challenging the legality of a collective bargaining seniority system must file suit within the first 300 days of the system's adoption	Employees may challenge a seniority system when it affects them, as well as when the system is adopted
<i>Price Waterhouse v. Hopkins</i> (Title VII)	In "mixed-motive" cases (i.e., those where lawful and unlawful factors motivated the employment decision), the employer can avoid liability by demonstrating that the same action would have been taken without the discriminatory motive. The burden of proof rests with the employer	Any intentional discrimination is unlawful, even if the same action would have been taken in the absence of the discriminatory motive

(Adapted from Civil Rights Act of 1991. Text and analysis. *Employment guide*, Special supplement; Bureau of National Affairs: Washington, DC, November 11, 1991; Vol. 6, No. 23, 5.)

federal government, severe restrictions have been placed on state workers' ability to sue their state in federal court for federal EEO violations. In two recent cases, *Kimel v. Florida Board of Regents* and *Garrett v. the University of Alabama*, the U.S. Supreme Court, for the first time, held that the ADEA and the ADA, respectively, were inapplicable to the states.^[6,7] In effect, state workers can file suit against state governments, but only if the state agrees to be sued and only under the state's EEO law. These laws tend to be weaker, less effective, and narrower in scope. For example, state disability laws tend to be much less rigorous than the ADA around reasonable accommodations.

The future of affirmative action also rests with the courts. However, it is important to note that given the demographic shifts in the United States as well as public employers' continued efforts to develop diversity programs, public sector workforces are becoming more diverse. Thus, despite court rulings, employers

seem unwilling to abandon their efforts to diversify their workplaces.

Ethics and Administrative Reform

Jeroen Maesschalck

*Instituut voor de overheid, Katholieke Universiteit Leuven,
Leuven, Belgium*

INTRODUCTION

Administrative or civil service reform has impacted the public sectors of many countries throughout the world since the 1980s. The reforms have included several strategies (maintain, modernize, marketize, minimize.^[1]), but most prominent were the changes that Hood assembled under the conceptual umbrella “New Public Management” (NPM). This includes the introduction of performance management systems, more responsibility and accountability for public managers, more competition in the public sector, the introduction of quality management techniques, etc.^[2,3]

The implementation of these reforms in governments throughout the world has sparked concern, both among academics and practitioners, about their impact upon the ethics of public servants. This article identifies four positions in this debate over the impact of the reforms on public servants’ ethics and concludes with the observation that in spite of their seeming rivalry, the empirical claims underlying these positions are in fact complementary.

ETHICAL CONCERNS ABOUT ADMINISTRATIVE REFORM

The apprehension for the potentially negative impact of New Public Management (NPM) reforms on the ethics of public servants has been strengthened by highly publicized scandals in many Organization for Economic Cooperation and Development (OECD) countries. Many of these scandals are about individuals behaving unethically, and often also illegally, and causing their public sector organization financial and other difficulties. A case in point is Robert Citron in Orange County, CA.^[4] Typically, these individuals were initially seen as exemplars or even heroes, who successfully managed to escape bureaucratic constraints in order to produce results and “get things done” until it was discovered that their escaping bureaucratic constraints also included manifest illegal behavior. It is argued that these excesses are caused by NPM reforms because the NPM-type rhetoric and reforms provided these individuals not only with the

opportunity to perform such behavior but also with the moral mindset to justify it.

NPM-type reforms are also alleged to lead to more collective or even systemic unethical behavior. A case in point are “creaming” strategies, a typical perverse effect of performance management systems. Suppose that the public servants who are in charge of vocational training of unemployed people would be assessed (and paid) on the basis of their “success rate,” defined as the number of applicants who are able to obtain a job following the training. It is not unlikely that these public servants would only allow the most job-ready applicants into their training courses. This would leave a considerable category of unemployed people without training, which is unlikely to be an intended effect of this policy.^a This is just one example of the ethically undesirable consequences that are alleged to be fostered by NPM reforms.

FOUR POINTS OF VIEW

The answer of public administration scholars to these scandals and to the more general concerns about the impact of administrative reforms on (un)ethical behavior of public servants is a discussion that can, in terms of Hood and Jackson, be conceived of as a “doctrinal debate.”^[5] Doctrines are “specific maxims about administrative whos, hows, and whats,” they “denote specific ideas about what should be done in administration.” Roughly summarized, four rival positions can be identified in this debate, each proposing their own administrative doctrines to foster ethical behavior in the public sector. The following paragraphs will summarize those positions. Although this overview will focus on the recent debate over the ethical impact of NPM reforms, it is in fact much broader because those against NPM reforms propose their own alternative, which is then in turn criticized by the other participants in the debate. Moreover, three of the four positions are

^aAlthough these creaming strategies are currently very relevant because of the popularity of performance management systems, they were already pointed out by Blau, P.M., 1955. *The dynamics of bureaucracy*. Chicago: University of Chicago Press.

rooted in a broader administrative philosophy, thus making this debate a contemporary version of older debates.^b

New Public Management

The first position is anchored in the NPM administrative philosophy. NPM's heyday started with the seminal 1991 article of Christopher Hood^[2] who conceived of NPM as a set of doctrinal ideas with a certain degree of coherence, (i.e., an administrative philosophy) that has come to be widely accepted. Hood^[3] mentions six doctrines to define the NPM administrative philosophy.

1. "Unbundle" the public service into corporatized units organized by product.
2. More contract-based competitive provision, with internal markets and term contracts.
3. Stress on private sector styles of management practice.
4. Put more emphasis on visible "hands-on" top management
5. Make performance standards and measures explicit, formal, and measurable.
6. Greater emphasis on output controls.

One could add to this the doctrine: "Apply quality management and a customer service focus." This doctrine was not the initial focus of NPM reforms, but has become very important in a "second wave of reforms."^[6]

The NPM proponents' consideration of the ethical consequences of administrative reform is rather modest. Sometimes, NPM proponents emphasize how competition mechanisms can reduce corruption, e.g., by lessening the opportunities of public servants to corruptly charge monopoly rents.^[7] More often, however, they remain silent on the topic of ethics.^[8] The assumption seems to be that ethical behavior will naturally follow from an implementation of NPM reforms. Ethical behavior is then mainly understood as behavior that strengthens "the three E's" (economy, efficiency, and effectiveness).

Traditional Public Administration

The second position is at the other side of the spectrum. It is rooted in "Traditional Public Administration"

(TPA), also referred to as the "old public administration"^[9] or the "orthodox model."^[10] Of course, TPA contains many different ideas and it would be incorrect and simplistic to present them as one monolithic block of doctrines and justifications without any internal debates or changes. Nevertheless, there seems to be broad consensus over a limited number of core doctrines including the following:^c

1. Public administration should be politically neutral.
2. The organizational structure should be a centralized bureaucracy.
3. Programs should be implemented through top-down control mechanisms, limiting discretion as much as possible.
4. Officials should be kept in a procedural straitjacket.

The administrative doctrine of TPA with regard to ethics management prescribes that the organizational processes be organized in such a way that "the individual ethical choice is limited to choosing to follow the rules (the ethical thing to do) or to violate them by commission or omission (unethical acts)."^[11] In the debate over the ethical effects of NPM reforms, the proponents of TPA have "throw[n] up their hands in horror at recent trends, seeing them as marking the destruction of the public service ethos."^[12] In the United Kingdom, Chapman and O'Toole^[13-15] argue for a return to the traditional civil service ethos and to the traditional concept of "public duty." Writing from the U.S. context, Frederickson^[16] also forcefully expresses his concerns about the ethical consequences of NPM innovations such as marketizing, privatizing, or contracting out, and he argues for a "re-regulation." One particularly prominent strand in the TPA tradition emphasizes the legal point of view and criticizes NPM "for its sometimes cavalier treatment of the rule of law, especially its free and easy slogans about eliminating red tape and letting managers manage."^[17]

New Public Service

The third position is derived from what has recently been labeled the "New Public Service" (NPS).^[9] Skidmore^[18] describes a similar approach as the "classical" or "Aristotelian" mode of organizing (referring to its roots in MacIntyre's work), while others^d have

^bAn earlier version of this discussion of the four positions was published by Maesschalck, J, 2004. The impact of new public management reforms on public servants' ethics: Towards a theory. *Public Administration* 82(2):465-489.

^cThe first three doctrines are taken from Denhardt and Denhardt.^[9] The fourth doctrine is taken from Ref.^[2]

^dFor example, Fox, C.J., Miller, H.T., 1996. *Postmodern public administration. Towards discourse*. Thousand Oaks: Sage.

labeled it the “communitarian/citizen alternative.” Denhardt and Denhardt present the NPS approach as a viable third alternative for the observed dichotomy between “the old public administration” and “the New Public Management.” Rather than traditional bureaucracies that are controlled from the top down and largely closed for citizens, Denhardt and Denhardt propose new mechanisms in which “the primary role of the public servant is to help citizens articulate and meet their shared interests rather than to attempt to control or steer society.”^[9] In order to achieve this overall aim, Denhardt and Denhardt propose seven doctrines that embody their administrative philosophy:

1. Serve, rather than steer.
2. The public interest is the aim, not the by-product.
3. Think strategically, act democratically.
4. Serve citizens, not customers.
5. Public servants should be attentive to the law, community values, political norms, professional standards, and citizen interests.
6. Value people, not just productivity.
7. Value citizenship and public service above entrepreneurship.

As for the recent debate over the impact of NPM reforms on ethics, those writing from an NPS point of view largely join the TPA advocates in their negative assessment of the ethical consequences of NPM reforms, but propose a different solution. Specifically, Denhardt and Denhardt argue that public sector organizations should be organized in such a way that public servants are not responsive to “constituents and clients” (TPA), nor to “customers” (NPM), but to “citizens.” Citizens are described as those people who “demonstrate their concern for the larger community, their commitment to matters that go beyond short-term interests and their willingness to assume personal responsibility for what happens in their neighborhoods and the community.”^[9] To make public servants capable of being responsive to these kinds of citizens, the doctrines described above should be the guide. Several other authors have criticized NPM from an NPS point of view. Although he also used TPA arguments to criticize NPM (see above), most of Frederickson’s prescriptive claims (particularly in “The Spirit of Public Administration”) rather correspond to the NPS administrative philosophy. One example of this is his plea for a “combination of patriotism (the love of the regime values) with benevolence (the love of others).”^[19] Gawthrop^[20] fits the NPS philosophy even more neatly. He contrasts the “democratic spirit” with the NPM-type “entrepreneurial spirit” and argues that the former should prevail. He also strongly criticizes

the TPA-type “ethics of compliance” he observed in the U.S. public administration the past five decades for leading to a soulless public administration, obsessed with procedural correctness. He argues that public servants should have a personal responsibility, with “service as the center of value.”

Ethics Management

The fourth position in the debate does not clearly build on a single identifiable administrative philosophy such as the previous three. Its central argument is that public sector ethics management is an important and evolving subfield of public management, which deserves its own set of doctrines, hence the “Ethics Management” approach. Its core doctrine is that an ethics policy should be a combination of doctrines from the three aforementioned approaches, adapted to the specific circumstances of the organization. Admittedly, arguments for a combination of different approaches have been articulated before. Cooper,^[21] for example, proposed such a combined approach in his seminal “The Responsible Administrator.” However, the success of the NPM discourse and the concomitant ethical concerns fostered a recent revival of this approach. The Public Management (PUMA) Department of the OECD^[22,23] has been among its most prominent promoters, together with practice-oriented academics such as Gilman^[24] or Uhr.^[25] These and other recent proponents agree with the NPM advocates that NPM reforms can have many beneficial consequences, but are at the same time conscious of the undesirable effects (particularly unethical behavior). However, in contrast with TPA and NPS, their solution is not to do away with NPM innovations, but to complement them with a well-developed public sector ethics management that is adapted to the reforms. They see two possible approaches to such an ethics policy. The OECD, Gilman, and originally Paine^[26] identify these as the “compliance” and the “integrity” approach, respectively. The distinction goes back to the famous Friedrich-Finer debate over the importance of internal and external controls on public servants, respectively.^e The “compliance” approach to ethics management emphasizes the importance of external controls on the behavior of public servants (e.g., legislation, strict behavioral ethics codes, and extensive control mechanisms) and thus comes very close to the ethics management doctrines of TPA. However, the “Ethics Management” proponents

^eFor a discussion, see Cooper, T.L., *The responsible administrator: An approach to ethics for the administrative role*; San Francisco: Jossey-Bass, 1998; 131–163.

observe that this compliance approach does not fit the NPM-style results-based managerial approach. It thus violates their basic doctrine of a management style adapted to the circumstances. Instead, NPM-type changes need to be complemented by an “integrity” approach to ethics management, which emphasizes internal control: control exercised by the public servant on herself/himself. This integrity approach is “based on aspirations, relies on incentives, and encourages good behavior rather than policing and punishing errors and wrongdoing.”^[23] Such an ethics management style is necessary because the increased discretion that goes with the reduction of hierarchy in NPM-type reforms needs to be paralleled by an ethics management style that supports the public servants in dealing with this discretion, rather than limiting their discretion by developing new rules and control systems.

CONCLUSION

This article presented four prominent positions^f in the debate about the impact of administrative reform on the ethics of public servants. Although the positions in this doctrinal debate seem rival, all authors can easily point at empirical instances that support their claims. For example, while the NPM literature is ripe with success stories of NPM reforms and convincing examples of the undesirable effects of traditional bureaucracies, the TPA proponents can easily point at the scandals that followed NPM reforms and show how these would not have occurred in a more traditional bureaucracy. How should we deal with these diverse claims? If all participants in the debate can provide convincing examples of their position, who should we believe?

To answer this question, it might be useful to distinguish between the normative and the empirical claims made in this literature. The normative claims underlying the three first positions^g are clearly rival. The proponents of these positions evidently disagree in their evaluation of both the desirability of particular types of ethical behavior and the seriousness of types of unethical behavior. In contrast with this rivalry among the normative claims, the empirical claims are rather complementary. While the proponents of a particular approach concentrate on its beneficial effects, the opponents point at its deficiencies. Although this might look rival, such claims can

empirically be complementary: It is perfectly consistent to claim that a particular approach can be beneficial in particular circumstances, but engender undesirable effects in other circumstances. In fact, this is an important maxim in management: Each innovation, however well intended, carries with it the risk of particular excesses. Kathryn Denhardt^[27] formulated this eloquently in the context of ethics management: “Every organizational structure can promote an ethical stance yet at the same time contain the seeds of pathology.”

One prominent strategy to cope with this risk is to ensure that all main perspectives are taken into consideration and structurally anchored in the organization. The permanent tension between the approaches that follows from this then helps to avoid blind spots for the potential negative effects of one particular approach.^h According to this strategy, the decision is not which of the three main administrative philosophies—New Public Management, Traditional Public Administration, and New Public Service—should be applied, but how all three of them should be combined. This is in fact what the Ethics Management approach, the fourth position in the debate, sets about to do. Proponents of this approach accept some NPM reforms, but also require that these are combined with two other approaches: a considerable degree of TPA (the “compliance” approach in the ethics management jargon) to delineate the discretion and ensure that the discretion is not abused and a considerable degree of NPS (the “integrity” approach) which stimulates public servants to use the remaining discretion to “serve citizens, not customers.” Such a complex balancing exercise will not guide us to clear-cut and neat solutions, but it does reduce the risk of administrative reforms leading to ethical disaster.

Ethics and Information and Communication Technology

Brian Negin

Israel Central Bureau of Statistics, Jerusalem, Israel

INTRODUCTION

Information and communication technology, in particular the Internet, has benefited global society by enabling unfettered dissemination of, and access to, information on a scale previously unknown to mankind. At the same time, this technology has created challenges to the enforcement of existing regional norms, pitting the value of freedom of speech (and of information) against other equally important values, such as the protection of human dignity.

THE IMPORTANCE OF INFORMATION AND COMMUNICATION IN SOCIETY

Human life and society depend on the ability to communicate information. While this seemingly self-evident truth applies to human development over tens of thousands of years, the recognition of the importance of information to human society is only a relatively recent one, rooted in the Enlightenment. The Enlightenment signified a societal change of orientation from natural duties to natural rights.^[1] One of the natural rights that has figured prominently in the development of Western society has been the *freedom of speech*, necessary for the actualization of democratic society. As recognized by the Supreme Court of the United States, *freedom of speech* includes the freedom to both access and disseminate information.^[2] An alternative approach expressed in the draft *Declaration of Principles* of the World Summit on the Information Society views the freedom to access and disseminate information not as a corollary of the *freedom of speech*, but as an independent right.^[3]

LIMITATIONS ON FREEDOM OF INFORMATION AND COMMUNICATION

Human society depends on the ability of human beings to communicate and also on the existence of norms that establish the borders of permitted behavior. Among these norms are those that define the permissible *content* of speech, as well as those that define permissible *access* to and *use* of that content. In a modern society, one may distinguish between such norms that

are based solely on social or cultural pressures (*extra-legal norms*) and those that are expressed in law (*legal norms*).

Extralegal normative control of behavior, including speech, generally occurs within social and professional networks that require *correct* behavior from their members or as a result of dedicated pressure groups promoting an agenda, such as those pressing for the removal of *controversial* reading material from school curriculums.^[4] Legal control of the content of speech protects societal values considered at least equally important as the freedom of speech. Criminal laws, for example, prohibit sedition, incitement to violence, incitement to racism, and the dissemination of obscene material. Civil laws prohibit the dissemination of defamation, the invasion of privacy, the violation of trade secrets, and the infringement of copyright.

Thus we see that while *freedom of speech*, including freedom of access to, and the dissemination of, information, is a fundamental value of modern civilization, it is not an absolute and unlimited freedom. Restraints on freedom of speech usually reflect a fine balance among competing societal values as developed over time within evolving social and technological contexts.

THE PROMISE AND THE CHALLENGE OF THE INTERNET

The Internet has created an exceptional platform for the dissemination of, and the access to, information. As reflected in the World Summit on Information Technology, one of the primary global issues today is how to provide full and uncensored Internet access to the world's population, including those nations that either lack a sufficient technological infrastructure or that choose, for political reasons, to limit access. It is commonly believed that access to information over the Internet, including the ability to communicate through it, is an enabling factor in the positive development of all people around the world. However, this utopian spin on the Internet tends to overlook social, ethical, and legal problems that the new technology has created. As scholars have noted, new technology can bring good to society, but can also bear unexpected consequences.^[5]

One of the unexpected consequences of the Internet is that its technology has created challenges to the enforcement of accepted societal norms, legal and extralegal, that define the permissible content of speech and the permissible access to, and use of, information. The Internet also has created new difficulties regarding competing regional or national norms.

These challenges highlight the ongoing struggle of society to define and enforce normative values necessary for human survival. This struggle is apparent in Section 9 of the current draft Declaration of Principles of the World Summit on the Information Society, titled *Ethical Dimensions of the Information Society*. Article 52 in this Section states:^[6]

The Information Society should be subject to universally held cultural and ethical values such as truth, justice, solidarity, tolerance, human dignity, shared responsibility, transparency and accountability, and without prejudice to the moral, social and religious values of all societies. All actors in the Information Society should seek to promote the common good, protect privacy, and to prevent abusive uses of ICTs. The freedom of use of ICTs should not undermine the human dignity, human rights and fundamental freedoms of others, including personal privacy, matters of faith and other personal beliefs. These values are particularly relevant when commercial activities are conducted through networks.

Following are three topics that illustrate some of the ethical issues consequential to the development of information and communication technology and particularly the Internet. These are online defamation, protecting minors from sexually explicit content on the Internet, and online privacy and confidentiality.

ONLINE DEFAMATION

The prohibition against defamation is at least as old as the Bible. The prohibition in the Ninth Commandment, against bearing false witness, has been interpreted as also prohibiting gossip and slander.^[7] In modern terms, the prohibition can be understood as protecting the value of human dignity, central to the modern worldview evolved in the Enlightenment. As a basic human value, its pedigree predates *freedom of speech*. At the same time, the content and enforcement of defamation law must be balanced against the value of freedom of speech.

A person can be held legally responsible for defaming another person. When defamatory speech is disseminated online, it must normally reside, if only temporarily, on the computer system of a service provider in order for it to be accessed. Barring the existence of specific legislation to the contrary, the

common default legal position in most Western countries would hold service providers liable for not removing such illegal content if duly requested to do so, analogous to the legal liability of distributors for the dissemination of third-party defamation in the physical world. This was the situation according to U.S. case law until 1995,^[8] as well as the position expressly taken by Germany in its Act on the Utilization of Teleservices.^[9]

However, in 1997, a U.S. Court of Appeals upheld a lower court decision immunizing service providers from all liability for *third-party* illegal content, including immunity from the equivalent of *distributor liability* in the physical world for not removing defamatory content when asked to do so.^[10] The court was concerned that recognizing service provider distributor liability would chill free speech on the Internet by encouraging an onslaught of demands by purportedly injured parties for the removal of allegedly defamatory material from service providers' computer systems. Service providers would either comply, thus implicating themselves in prior restraint of free speech, or not comply and face enormous legal fees to defend themselves while passing on the additional costs to users in the way of higher fees.

The preponderance of U.S. case law, following the above precedent, today holds that an injured party to online defamation can only hold the creator of the defamatory content liable to pay compensation for damage.^[11] The result is that the substantive law of defamation remains the same, while the ability to enforce it in the online environment has been reduced. This change reflects a weakening of the norm protecting human dignity while strengthening a competing societal norm, the freedom of speech. In this sense, the technology of the Internet has wrought a substantive change in the balance of societal values, at least in the United States, in the context of defamation law.

PROTECTING MINORS FROM SEXUALLY EXPLICIT CONTENT ON THE INTERNET

Freedom of speech includes the freedom to disseminate sexually explicit material, as long as it does not violate local community standards. However, even sexually explicit material that is legally available to adults might be harmful to vulnerable and innocent minors. The technology of the Internet has made access to sexually explicit content very easy, even for minors. In addition, a mistyped web address can inadvertently bring up a pornographic Web site, even to the most experienced adult. How can children be protected against the harmful effects of such material online?

While some argue that the best protection for minors against harmful content on the Internet is

education and parental guidance,^[12,13] the U.S. government has decided that this is a matter for legislative intervention. Two federal attempts at criminalizing the dissemination to minors, over the Internet, of constitutionally protected material that, for minors, would be considered *harmful*^[14,15] have been judged to be unconstitutional because they were overbroad and limited adults' rights to otherwise legally protected speech.^[16,17] A third legislative attempt to protect minors from such material, the Children's Internet Protection Act (CIPA),^[18] has been upheld by the U.S. Supreme Court.^[19]

Under CIPA, a public library may not receive federal assistance for the provision of Internet access, unless it installs software to block obscene or pornographic images and to prevent minors from accessing material deemed harmful to them. The legislation addresses, among other things, the problem that library patrons of all ages, including minors, regularly use public library Internet computers to access not only information, but also online pornography. In addition, library staff or patrons may at times be exposed to pornographic images left displayed on computer terminals or printed on library printers.

The Supreme Court held that public libraries, by necessity, must make value judgments about what material will be included in their collections. Public libraries may also make value judgments regarding the type of content they will make available to the public over their Internet computers. Just as most libraries exclude pornography from their print collection, they may exclude it from Internet access on library computers by using filtering applications—even if those applications are imperfect and might *overblock* access to legal and non-harmful information while *underblocking* access to some illegal or harmful sites. Therefore public library use of Internet filtering software does not violate adult patrons' First Amendment rights.

Notwithstanding the legality of the use of filtering software in public libraries, discussion continues as to the efficacy of the use of such software and the alternatives to it. In the settlement of a workplace harassment case brought by Minneapolis librarians regarding patron use of public library Internet computers to access pornography, it is reported that library officials will consider, in addition to filtering software, changes in the printing of Internet material, increased sanctions for those who violate library Internet policy, and consultation with staff about placement of terminals.^[20,21]

The Children's Internet Protection Act also requires installation and use by schools of filtering or blocking software on Internet computers to be eligible to receive or retain universal service assistance. The Electronic Frontier Foundation, in its study on Internet blocking in public schools, criticizes the efficacy of the use of such software.^[22] It concludes that because filtering

or blocking software both *overblocks* permissible material and *underblocks* harmful material, it cannot sufficiently protect children while at the same time, it damages educational opportunities for students to access information.

PRIVACY AND CONFIDENTIALITY ON THE INTERNET

The technology of the Internet enables the collection of information about users of services such as the World Wide Web, even without the individual user being aware of such. This information might include data on the user himself (name, E-mail address, and perhaps more) and the web pages visited on any given site. Sometimes the information on the user is anonymous, in the sense that Internet technology enables, through the use of *cookies*, the tracking of a particular computer's navigation through a given Web site. The computer can be identified [by *cookie*^[23] or Internet Protocol (IP) address], but unless personal information has been provided by the user of the computer, it is difficult to attribute web surfing habits to a particular, identified person.

However, the tracking of identified users on the Internet is becoming easier as more and more Web sites require *registration* to access the information on the site. The *New York Times* Web site is an example.^[24] To receive free access to the online newspaper, one must first register and provide the following personal information: E-mail address, country, zip code, age, sex, household income, industry, job title, job function, and subscription status to the *New York Times*. The use of this information is in accordance with a privacy policy^[25] that describes what personal information is collected, how usage is tracked on the site (*cookies* and IP address), and what use will be made of the information collected (statistical analysis and banner advertising, E-mail if you elect it as an option during registration, and sharing information with partners on an opt-in basis only). This example demonstrates the striking of a balance between commercial enterprise and the protection of privacy on a contractual basis. To receive a commercial commodity for free, a person gives up a bit of his or her own privacy under the terms of an agreement that delineates the permitted use of the information provided.

Non-contractual limitations on the use of personal information also exist, mandating maintaining the confidentiality of third-party private information stored on computer systems. For example, the U.S. government must abide by the Privacy Act of 1974 that prohibits use of personal information by the federal agencies for purposes other than those for which it was provided.^[26] While U.S. legislation applies only

to the federal government, the European Union Directive 95/46/EC on the protection of individuals with regard to the processing of personal data and on the free movement of such data applies to everyone.^[27] It also requires that personal information be used only for the purpose for which it was provided. The directive has been implemented by the member states in their own internal legislation.^[28]

Setting the boundaries of permitted use of private information in a digital environment requires taking steps to protect that information from unauthorized access or use. The person, business, organization, or government holding the information must establish administrative policies regarding the use of the information that conform with the privacy norms binding it. In addition, it must also take computer security measures to prevent unauthorized access to that information both from within and from without. Steps from within include limiting access to such information only to those who have been granted access privileges through user name, password, and access rights administration. The protection from outside access via public communication networks, including the Internet, will usually include, in addition to the above, firewalls and other software and hardware that can make unauthorized access by outsiders very difficult. These computer security measures are normally grounded in an organization's policy on computer security intended to set the guidelines not only for the protection against unauthorized access to sensitive information residing on the computer system, but also to protect the system itself against being compromised as a result of external attack, natural disasters, or simple equipment failure. For example, Appendix III of OMB Circular A-130 on the management of federal information resources requires that federal "[a]gencies shall implement and maintain a program to assure that adequate security is provided for all agency information collected, processed, transmitted, stored, or disseminated in general support systems and major applications."^[29,30]

CONCLUSION

The ease of use of the Internet as a means of accessing and disseminating information, its global reach, and the power of its technologies create challenges in enforcing established societal values or balancing among competing values. Freedom of speech enjoys a technological advantage in this environment, as does the ability to gather and process information about individuals. As a result, other values such as the protections against defamation, against harm to vulnerable minors, and against the invasion of privacy may suffer. Human society has always had to find the proper balance

between these and other competing values, especially in the context of new information technologies.

This process is an ongoing one. Society continuously examines and reexamines its resolution of these conflicts even in the absence of new technologies, learning from experience as well as responding to external forces, such as the terror attacks of September 11. In this context, the conflicts discussed above in this entry continue to be scrutinized by the public, the courts, and the legislator and may remain unresolved for some time to come. At the same time, information and communication technologies shall continue to develop, providing new challenges to realizing their potential while maintaining the ethical balances necessary to promote the common good.

Ethics and Public Policy

Amy K. Donahue

*Institute of Public and Urban Affairs and Department of Political Science,
University of Connecticut, Storrs, Connecticut, U.S.A.*

INTRODUCTION

Ethical questions surrounding the substance and application of public policy arise daily, as a cursory review of newspapers and news broadcasts readily demonstrates. In a single week in 2001, for example, the questions of whether the government should fund research that uses human genetic material, how to allocate tax refunds, whether to invest in building a national missile defense system, and whether to allow oil exploration in a wildlife refuge all competed for attention as part of the national policy agenda. Such issues are inherently ethical because they turn on normative choices—trade-offs among multiple values, judgments about how to interpret complex data, and decisions that distribute power and resources. In short, interactions between ethics and public policy are at once ubiquitous and complex.

DEFINITIONS

Public policy and ethics are each vast and disparate realms of scholarship and practice that defy concise definition. Nonetheless, some broad characterization of these concepts and the linkages between them is warranted and useful.

Public Policy

Broadly speaking, public policy comprises the development and outcomes of government decisions. It is fundamentally concerned with three kinds of decisions: first, what problems exist in society?; second, when should government intervene to solve them?; third, how should it intervene?; or, as Harold Lasswell said in 1936, public policy is about deciding “who gets what, when, and how.”^[1] As commonly used, the term “public policy” has several variants. It can refer to the outputs or outcomes of government processes—that is, the substance of what government does, rather than the way it makes decisions—noting also that what government intends to do is different from what it actually does. Alternatively, it can connote the general

framework of authoritative rules that guide government activities, including but not limited to legislation. Finally, it may mean a program of action designed to achieve a specified goal or purpose that often involves all levels of government and formal as well as informal actors.^[2]

Public policy fulfills an array of societal objectives. Among the most important functions of policy are the reconciliation of conflicting claims on scarce resources (accomplished by establishing incentives for cooperation or collective action that would be irrational absent government intervention, or by providing direct services or benefits to citizens), the prohibition of behavior unacceptable under reigning societal norms, the protection of individual and group rights, and the promotion of activities that are essential or important to governance. To meet these objectives, policy is created in a vast array of substantive realms that distribute and redistribute resources and regulate behavior.

Public policy is generated through a complex series of negotiated activities collectively known as the policy-making process. This process is how society validates claims about resource and power needs—how it decides which needs are real and legitimate, and what approach it should take to resolving them. This is particularly salient because government policy is generally believed to be about collective interests, but needs are almost always experienced individually. In a sense, policy politics is about defining individual needs collectively, as “public” needs.^[3]

Generally, the policy-making process incorporates policy formulation, implementation, and the subsequent effects of policy. An important point is that the process must also account for the range of factors that affect whether policy decisions and their social effects are consistent with popular preferences. In other words, public policy cannot be separated from the environment in which it is made. There are two important dimensions and effects of the environment to consider. First, the political and ideological context must be acknowledged. These are fundamentally important because they define what forms of policy are acceptable and whether they can garner enough support to be implemented. Second, a whole array of

socioeconomic factors affects whether a policy can achieve its desired outcomes. These contingencies bear on how ethical principles can be defined and applied in the context of public policy making.

Ethics

Ethics receives treatment in several entries in this volume that clarify others of its aspects. With respect to public policy, ethics refers to moral reasoning and behavior by policy makers and other stakeholders in the public policy system. Ethics enters this system because all public policies express value judgments by allocating resources, entitlements, and authorities. As Swain and Duke explained, “ethics concerns things about which individuals have behavioral choices. Those choices have social consequences.”^[4]

The exercise of ethics in policy making proceeds from an array of philosophic traditions—most generally, deontological theories and teleological theories. Generally, deontological approaches are more classical and are concerned with the moral legitimacy of the policy process. These approaches tend to yield rules that prescribe proper behavior for decision makers and are meant to be universally applied. Along these lines, some in the field take a deontological view, under which ethics refers to the system of moral conventions that direct conduct. This perspective gives rise to published codes of ethics, available for an array of professional associations and public agencies, that influence the nature of public policy by guiding the behavior of policy makers.

Teleological approaches, in contrast, are focused on the goodness of consequences, rather than the character of the process that caused them. This view permits decision makers discretion in the application of moral rules to account for contingencies that affect the achievement of desirable outcomes. The literature of public administration commonly exhibits a teleological bent whereby actors weigh policy alternatives according to the net utility (or satisfaction) they generate. This is most evident in the frequent references to benefit–cost analysis as an appropriate rational basis for making normative policy decisions.

In practice, neither deontology nor teleology offers fully apposite guidance under all circumstances, and elements of both typically enter policy-making activities. Policy makers thus may employ broad ethical principles—or even specific rules of conduct—but make exceptions when these principles and rules are inconsistent or policy outcomes can be improved.^[5] The impracticality of rigid conventions has prompted several scholars to characterize the nature of ethics in practice as evolutionary. Here the professional responsibilities of actors in the policy process are defined over

repeated application to generate what Cooper termed an “operational ethic.”^[6] Similarly, Tong saw public actors as developing (or in need of developing) a personal moral perspective that upholds a chosen set of ideals^[7]—a compass, rather than a rule book.

ETHICS IN THE POLICY-MAKING PROCESS

Most scholars agree that public policy making involves an iterative staged process, and most agree what the stages generally are, although how exactly they are delineated varies somewhat. Each stage poses a forum for value-based debate and thus an opportunity for ethical dilemmas to arise. Generally, the main stages and the ethical considerations each raises are (see Fig. 1):

1. *Issue identification:* Public officials and non-governmental actors care about a broad range of matters. During issue identification, this list is narrowed to an agenda, or the set of concerns policy makers seek to address. In other words, issue identification is the process by which policy makers recognize specific problems, decide that government can and should address them, and initiate the development of focused solutions. Ethics bears on issue identification because alternative sets of values offer different conceptualizations of the public interest and thus suggest different public policy objectives. Moreover, how policy issues are characterized at this stage of the policy process later shapes the nature of solutions sought and the commensurate distribution of resources that results from execution of these solutions. Further, the particular values on which a policy agenda is based prompt the use of certain criteria for assessing the value of benefits and costs that will accrue from a given policy over other possible criteria.
2. *Policy creation:* This phase starts with policy analysis, a mechanism by which the range of possible alternative solutions to a problem is identified and analyzed in terms of their monetary and non-monetary benefits and costs. Then, an alternative is chosen and a policy is drafted that specifies what objectives are sought and how things will be done to reach them. Political considerations often modify the proposal to make it acceptable (known as the process of legitimation). The policy is then adopted, most commonly as law, but executive orders, rules, regulations, and court orders are also possible. Ethics enters the public policy process at this stage because all policy fundamentally involves the distribution of resources, which are finite.

Fig. 1 Relationship of ethics to the policy-making process.

This scarcity forces policy makers to make choices that trade off between what Rohr characterizes as the two key activities of ethics: preventing bad and promoting good.^[8] Ethics is also an important dimension of analysis where the choice of research methods, and the interpretation of data and findings, involve a series of judgments that profoundly influence how policy makers understand the ramifications of each policy alternative.

3. *Public administration*: Once adopted, the public bureaucracy usually takes over to implement the chosen policy—to put it into action. Implementation may proceed according to a rigid program that explicitly and rationally lays out procedures to forestall cooptation of the process, or it may be freely structured to permit policy improvements and more flexible response to contextual realities.^[2] Regardless of how carefully or loosely defined the process, implementation typically involves a long series of activities and a multitude of actors; thus, there are many points at which there may be pressure to modify the policy from its original design. As a result, public administrators are repeatedly

confronted with ethical dilemmas in the course of implementation. This may occur for a host of reasons, including that the stated policy goals are vague, obscured, or forgotten; stakeholders seek to substitute their own objectives or to intervene to halt or alter implementation; unforeseen technical difficulties arise that require adjustment; new information about policy effects arises as implementation progresses; multiple internal and external authorities have conflicting expectations; or there are overlapping jurisdictions and authorities that must be resolved.

4. *Evaluation*: Once implemented, it remains to decide if the policy worked—in other words, to determine the extent to which it produced its intended consequences, and whether there were any unintended ones. Frequently (even usually), policies fall short of their objectives, often because of ambiguous goals, ignorance about how to reach those goals, adversarial political conditions, or poor measures of success. Thus, evaluation also helps to uncover why policies do not wholly meet the agendas of those who designed them. There are hundreds

of types of evaluation that essentially fall into two big categories: process evaluation looks at the extent to which implementation comports with prescribed guidelines, and outcome evaluation looks at the extent to which a policy achieved a positive change in the problem being addressed. Ethical concerns arise during evaluation because evaluation fundamentally depends on measurement, a tricky business that involves resolving what measures should be used, whether it is possible to measure everything that matters, and the extent to which observed effects were within the government’s control.

ETHICS AND POLICY ANALYSIS

The bearing of ethics on analysis deserves specific comment because the central objective of policy analysis is to improve public policy, an inherently normative target. Policy analysis directly intervenes in the policy-making process at several junctures. It is the set of formal methods by which public problems, their various alternative policy solutions, and the outcomes of chosen solutions are understood. Often these methods attempt objectivity—that is, they involve systematically gathering data, employing reliable methods to analyzing it, and choosing the best possible option according to specified criteria. Yet, the reality that emotions, values, beliefs, capabilities, and other mitigating contingencies enter into any diagnostic process means that policy analytical endeavors have embedded non-rational components that challenge their ostensible objectivity.

Over time, the field of policy analysis has undergone dramatic transformation to contend with the role of values in social scientific study. Policy analysis first emerged as a self-conscious discipline in response to the demands of the Planning, Programming, and Budgeting System in the Department of Defense after Word War II. These origins engendered a rationalist analytical approach that presumed that logical reasoning and scientific methodologies could yield

optimal decisions. The field matured as its role expanded throughout the branches and levels of government, as well as beyond the public sector, so that policy analysts were asked to respond to a diverse set of demands and decision makers across society.^[9] With such diversity came recognition of the role of values as an important influence on the policy analytical and policy-making process. As Dunn noted, “The same policy-relevant information may be interpreted in markedly different ways, depending on the assumptions contained in the frame of reference, theory, or ideology of policy analysts and other policy stakeholders.”^[10]

Inevitably, disagreements about values arise in the policy process. Some argue that because values claims cannot be demonstrated empirically, and merely communicate preferences, they cannot enter rational debate. Others, however, hold that policy debates and analysis can and should be founded on explicit statements of ethical rules and moral principles, although debates about the legitimacy of value choices can only be resolved politically. Sound contemporary policy analysis thus attempts to use evidence and logic to choose the most favorable alternatives, but recognizes that public policy decisions cannot be divorced from the ideologies, politics, values, or environment in which these decisions are set, or from the moral perspective of those who make them. Thus, policy analysis and ethics should go hand in hand. As Brown explained, “ethics helps us identify assumptions we hold in common with others, and discard non-crucial assumptions at variance with those of others. It therefore helps us identify areas of consensus.”^[11] We can therefore identify where empirical research will not improve a given decision process because remaining disputes are over values.^[5]

ETHICAL BEHAVIOR BY POLICY MAKERS

Finally, a word about the behavior of those who practice policy making. One reason that ethics is central to the public policy process is that citizens expect decision

makers who are in the privileged position to analyze, make, and implement policy to “do the right thing.” In other words, as Tong explained in her discussion of ethical behavior by policy experts, with privilege comes a requirement for trustworthiness.^[7] Even analysts, who may not wield final decision-making authority, have power derived from their presumed expertise and thus have some responsibility for policy consequences.

This requirement can be onerous when a public official is asked to serve numerous constituents with varying needs, consider the implications of policy for third parties (present now and in future generations), evaluate data and findings susceptible to alternative interpretations, and balance conflicting values. On top of these demands, Weimer and Vining argued that policy makers and analysts must also uphold their own moral principles—as they explain it, individuals must be true to their own personal conception of “the good society.”^[12] In short, the broad and common teleological perspective in public policy requires public officials to weigh these demands simultaneously, and to manage continuously outcomes, circumstances, and values throughout the policy process. This multiplicity of constraints on behavior creates what Frankena called a “conflict of duties.”^[13]

Many organizations and associations have developed codes of ethics designed to prescribe behavior in ways that assist actors in managing conflicts of values, objectives, and interests (Table 1). Such sets of rules are difficult to apply universally and are subject to individual interpretation, but they can provide guidelines for how to handle common ethical dilemmas. They also serve as the formal representation of consensus within a particular agency or field about the goals or ideals to which members aspire and the standards of conduct that all agree constitute professional behavior. Moreover, as Patton and Sawicki argued, the exercise of developing ethical codes has utility because it can help to clarify moral principles and shed light on ethical dilemmas, and because it

helps to keep policy makers conscious of the ethical choices at hand.^[5]

Ethics in Organizations, Implementation of

Evan M. Berman

*Public Administration Institute, Louisiana State University,
Baton Rouge, Louisiana, U.S.A.*

INTRODUCTION

Organizations undertake many activities that aim to increase the ethical conduct of employees and to ensure that ethical principles are reflected in their programs and policies. Although no organization can prevent isolated incidents of unethical conduct, much can be done to systematically improve ethical conduct, thereby increasing stakeholder trust and, in some instances, protecting organizations from legal or moral culpability. The following discusses major elements of an ethics implementation strategy.

RECENT DEVELOPMENT OF ETHICS IMPLEMENTATION EFFORTS

Concern for ethics in public administration greatly increased during the post-Watergate period in the late 1970s. Although initially focused on individual ethics (specifically, criminal acts), efforts soon led to the passage of new or more stringent ethics laws. Many of these new laws focused on conflict of interest situations that involve the acceptance of gifts, employment (limiting “revolving door” and lobbying practices for those who recently left a government office), and financial disclosure. The federal government and many states established or increased their government ethics office to oversee the implementation of ethics laws.^[1]

During the late 1970s and early 1980s, many observers also called for an aspirational ethics strategy that aimed to promote public-sector values. This aspirational strategy complements the legal strategy that focuses on minimizing wrongdoing. During the late 1980s, many organizations began to develop or emphasize codes of ethics that identified their aspirational values. Typically, codes of ethics discuss organizational values related to democratic governance, the public interest, personal and professional integrity, having respect for others and a constructive attitude, transparency and inclusiveness in decision making, and effective and efficient services.

Despite the growing importance of ethics in the 1980s, few organizations had a well-defined ethics implementation strategy in place. Merely having a code of ethics does not guarantee ethical conduct.

During the 1990s, codes of conduct were developed that detailed specific conduct that should or should not occur. Training was increasingly used to communicate these standards to employees and to help them address a broad range of common but ethically troubling workplace situations. Facilitation was also used to help groups of employees develop their own codes of ethics and conduct. In some organizations, ombudsmen were also used. Today, these tools are beginning to be integrated with other, established practices, such as hiring and leadership, to provide a systematic ethics implementation strategy that involves assessment, training, and reinforcement.

ETHICS ASSESSMENT

If the purpose of ethics implementation is to increase ethical conduct, or support existing ethical conduct, then managers need to know the current state of ethics in their organizations. An ethics climate survey is a systematic, written survey that probes existing employee knowledge of ethics standards, as well as the presence of conduct that may be ethically troublesome. Such a survey supplements managers’ subjective assessment that may be based on their intuition and the unethical acts of a few. Typically, all employees or a sample of employees are asked to voluntarily participate in an ethics climate survey. At this time, climate surveys are diagnostic, only; they have not been psychometrically validated against a broad sample of organizations. The results of ethics climate surveys can also be used as an element of training (below), when results are discussed with work groups.

For example, employees are asked to evaluate the following questions on a seven-point Likert scale that ranges from Strongly Agree–Strongly Disagree (Ref.^[2]). This instrument contains 43 items):

“Employees maintain the same ethical standard even when no one is watching.”

“My supervisor encourages me to act in an ethical manner.”

“My department has a defined standard of integrity.”

“You can rely on the accuracy of the organization’s information about what will or will not happen.”

“Members of my department have not misused their positions to influence the hiring of their friends or relatives in government.”

IMPLEMENTING ETHICS THROUGH LEADERSHIP

Many studies support that top leaders are examples of moral conduct for others in organizations. When top leaders are seen to espouse the highest values of virtue, and are strong advocates that these values are adopted by others and incorporated into decisions and organizational systems (such as human resource management), then ethical conduct is readily promoted. Conversely, the popular expression “rot starts at the top” identifies the corrupting impact of top leaders on organizational culture when ethics is not espoused in word and deed. When top managers are perceived as getting away with or condoning wrongdoing, then calls for increased ethical conduct by others ring hollow and will have little impact.

It is currently believed that top leaders should develop ethics priorities for their organization. These include a variety of standards and specific actions, such as regarding client relations, program development, accounting, financial disclosure, personal responsibility, and so on. The above ethics climate survey can assist top managers in deciding which ethics items should be priorities. When top managers make ethics standards important priorities for lower managers, a cascading effect occurs when lower managers advocate the same standards in their units, setting examples for their employees and supervisors. This effect is reinforced by informal and formal structures of accountability; for example, managers may be asked to ensure that specific ethical conduct is discussed with employees, or that certain ethical standards be reflected in program decisions.

For example, one such way in which ethics is promoted is by making ethics a criterion in hiring and promotion. The background check of candidates includes questions about their ethics judgment and examples of exemplary ethical behavior and ethical misconduct, if any. During job interviews, candidates are given scenarios for analysis that involve matters of ethics, such as potential conflicts of interest (for example, accepting minor gifts). They may also be asked about their support for ethics training and other implementation activities and their experience with making ethics a priority in their units. Such ethical standards and practices in hiring increase the likelihood of obtaining candidates with ethical behavior. Disseminating these standards sends a signal to existing employees who hope for promotion that ethics is an important priority for their organization.^[3]

ETHICS TRAINING

In recent years, many professional associations published new ethics training materials for their members. These materials included seminar training manuals, ethics readers, and ethics self-tests in paper and electronic formats (for example, CD-ROM). Ethics training is one of several ways through which top leaders indicate their commitment to ethics. The purpose of many training packages is to increase ethical behavior through new insight and understanding. Ethics training is typically conducted in small groups, which promote insight through feedback and participation by all. Ground rules typically include that everyone should participate, and that comments stay in the room, which promotes confidentiality.^[2]

Ethics training efforts typically begin with a definition of ethics as a standard of conduct. A code of ethics and conduct captures the important standards of an organization. Then, a distinction between ethical and legal conduct is made. For example, leaving work a few minutes early each day is legal but unethical. The importance of ethical conduct is linked to heightened trust, morale, and productivity. Cases are widely used to highlight the complexity of many ethical dilemmas, to discuss proper ways of dealing with ethical complexity, and to heighten awareness for unethical temptations and various warning signs (for example, “no one will ever know...” or “I deserve a little extra...”).

For example, trainees are asked to discuss the following situation. A very competent employee of the agency has quietly been using agency resources, including office supplies, copies, phone, vehicles, and health supplies, to operate a small, private business. Over a period of several years, this has resulted in the misuse of several thousands of dollars in agency resources. Is there an ethical problem? What should you do?^[4] This case is often adapted in the following way: What if a competent worker has used office supplies for incidental, personal use. Is there an ethical problem? What should you do?

Ethics training not only teaches employees to identify and deal with ethically compromising situations, it also provides them with a general framework for dealing with ethical issues. Typically, such frameworks begin with fact gathering, preparing a statement of ethical principles, preparing a statement of legal issues (if any), identifying consequences, examining options, and analyzing of options.

REINFORCEMENT

Ethics is reinforced by providing feedback to employees about their conduct. Feedback can be used

to reinforce the ethics priorities of organizations. Theories of motivation suggest that the impact of feedback on behavior is most effective when feedback is perceived as being swift, certain, and significant. Two types of feedback are distinguished: feedback that aims to eliminate (discourage) unethical behavior, and feedback that aims to encourage ethical behavior.

Many public organizations have officials and bodies whose job includes investigating wrongdoing. Federal agencies often have Inspectors General (IG) who provide a broad range of audits, include those relating to fraud and abuse. IGs operate independently of agency executives. Many states have Ethics Commissions whose job is to oversee the implementation of ethics laws and to investigate allegations of ethical wrongdoing. The U.S. Office of Government Ethics oversees the implementation of ethics laws in the federal government and provides regulatory and compliance information to agencies; many large federal agencies have their own ethics offices. Collectively, IGs, Ethics Commissions, and Government Ethics Offices might be thought as “ethics police.” In addition, some agencies have ombudsmen who also oversee ethics complaints, and many professional associations provide ethics advice and sometimes investigate ethics complaints against their members.

Consensus exists that ethics policing is only somewhat effective in reinforcing ethics. Although the work of IGs and Ethics Commissions on individual cases typically is thorough in its fact finding and unbiased in its conclusions, ethics policing is neither swift nor certain. Many complaints take years to investigate. The number of complaints, and those that are investigated, are quite small. Investigations are often limited to allegations of legal wrongdoing. Thus, the presence of an ethics police does not appear to be much of a deterrent force for those inclined to commit unethical acts. Rather, the rigor with which individual organizations deal with unethical acts may be a greater deterrent. When managers pursue allegations and take a proactive stance in their investigations, the effect on conduct may be more certain.

Similarly, managers can reinforce positive ethical behavior by acknowledging and rewarding it. This can be done formally and informally. In some organizations, performance appraisals now include a category that allows managers to reward such behavior. Ethical actions can also be the basis for evaluating employee performance awards. In addition to these formal sanctions, managers can also informally acknowledge ethical conduct to individuals. Recognition is likely to be more effective when it is timely, certain, and significant.

IMPLEMENTING ETHICS IN SPECIAL SITUATIONS

Many work situations involve special attention to ethics, a few of which are discussed below. Readers interested in ethics applications in their areas can contact their professional associations which sometimes have publications or training materials relevant to ethics. They can also obtain information from the references below and from Internet sites that deal with ethics.

Law enforcement, for example, involves concerns for the rights of alleged offenders and their victims. This has received heightened interest in the wake of publicity related to wrongdoing. Those in police custody deserve to be treated with respect and dignity, regardless of race and alleged crime. Law enforcement also raises concern about bribery and criminal wrongdoing by officers. Prolonged exposure to criminal activity can have a corrupting impact on those who come in contact with it. Thus, ethics implementation in law enforcement requires the development of ethical standards that deal with these problems, and implementation through training, policing, reinforcement, and top leadership.^[5]

Health care settings require consideration for patient rights. Patients may be quite vulnerable financially, emotionally, and physically when they seek treatment. Ethical treatment of patients requires full and timely disclosure of diagnosis and medical options. Doctors have an obligation to avail patients of their options, including second opinions. Then, nursing of patients requires attention to various side effects of treatments, including emotional consequences.^[6]

City management has its own unique challenges. It is increasingly common for public organizations to employ both spouses, which may be necessary when recruiting scarce talent. This raises issues regarding supervision and promotion, especially when one of the spouses is the city manager. City management also involves ethical challenges of dealing with elected officials, such as requests for personal services. In this regard, ethics training of elected officials is now increasingly mandatory for newly elected officials.^[3]

Finally, in some developing countries, corruption and graft have become accepted ways of dealing with government officials. This is furthered by extraordinarily low compensation structures for public officials. Ethics implementation in these settings requires not only an increase in ethics policing but also greater transparency in the interactions of employees and citizens. This is achieved through, for example, increased job rotation as well as publication (transparency) of exemptions of delinquent taxes and regulatory requirements that often are the object of graft and corruption.^[7]

INTERNET RESOURCES

A variety of ethics-related web sites are available. A good starting point is the Ethics Section of the American Society for Public Administration at <http://www.aspanet.org> or <http://www.niu.edu/~tp0dcm1/aspa/ethicsec/index.htm>. The Ethics Section Newsletter, *Ethics Today*, regularly publishes a list of ethics-related web sites (see, for example, the Winter 2000 issue, pp. 4–5). Ethics in Public Administration, Teaching of

Donald Menzel

Division of Public Administration, Northern Illinois University, DeKalb, Illinois, U.S.A.

INTRODUCTION

The teaching of ethics in public administration is a multifaceted and often controversial enterprise. It is multifaceted because the field of public administration ranges broadly within and across organizations, nations, and cultures. It is often controversial because there is little agreement on what to teach and how to teach ethics. Indeed, some persons believe that ethics cannot be taught to others in a traditional class or course context. Rather, the best that can be hoped for is to teach *about* ethics. Still, there is widespread view among practicing public administrators and educators in the United States and abroad that an ethical public service is essential to a well-functioning democracy. According to this view, the teaching of ethics to men and women who occupy positions of public trust should and must be pursued, regardless of the arguable outcomes.

ETHICS AND PUBLIC OFFICE HOLDING

“When a man assumes a public trust, he should consider himself a public property,” President Thomas Jefferson admonished. Yet, there are legions of stories in various countries where these words have fallen on deaf ears. In Jefferson’s age, it was often believed that men of character were the essential foundation for building a democratic and just society. Today, it has become abundantly clear that, although character qualities are important among the men and women who conduct the nation’s public affairs, they have not proven to be reliable qualities.

President John F. Kennedy, in a message to Congress on April 27, 1961, also recognized the importance of recruiting men and women of sound character to public office when he said, “the ultimate answer to ethical problems in government is honest people in a good ethical environment.” Furthermore, we “must develop in all government employees an increasing sensitivity to the ethical and moral conditions imposed by public service.” In other words, recruiting honest people to public service is highly desirable, but is not enough. Thus, we have here a statement about teaching ethics—it should increase a person’s “sensitivity to the ethical and moral conditions imposed by public

service.” This is not so arguable, and it is doable; that is, it does not get mired in the quandary of teaching character traits that could presumably change one’s character.

SENSITIVITY AND AWARENESS TEACHING

A sensitivity and awareness approach to the teaching of ethics in public administration has followed two primary paths. The first path is legalistic and is often reflected in state-level ethics commissions that provide advice and instruction to state and local public employees and elected officials on the “dos and don’ts” of state ethics laws. Such laws typically emphasize conflicts of interest, financial disclosure, and confidentiality of information. This “how to stay out of trouble” approach is also embraced by the U.S. Office of Government Ethics. The bad news about this approach is that it is often reduced to the level of “if it’s not illegal, it’s okay!” This approach, as John Rohr aptly reminded us in *Ethics for Bureaucrats*,^[1] is the “low road” to public service ethics.

The second path is semilegalistic in its focus on professional codes of ethics or agency rules of acceptable behavior. At the professional association level, for example, nearly every public service association has adopted a code of ethics that its members are expected to support. Two professional associations are illustrative in this regard—the American Society for Public Administration (ASPA) and the International City/County Management Association (ICMA). The ASPA is a 10,000-member organization consisting primarily of educators, students, and public employees drawn from local, state, and federal agencies, as well as members of non-profit associations. The ASPA code, which was adopted in 1984, identifies five key principles: 1) serve the public interest; 2) respect the Constitution and the law; 3) demonstrate personal integrity; 4) promote ethical organizations; and 5) strive for professional excellence. Members who violate the Code can be expelled from ASPA, but there has been a noticeable absence of such actions taken (see <http://www.aspanet.org/>).

The ICMA is a 7500-member organization consisting primarily of practicing public managers in cities and counties in the United States and abroad (e.g.,

Ireland, Australia). The ICMA code dates to 1924, and provides specific guidance on acceptable and unacceptable behaviors of local government managers. For example, it is deemed unethical for a city manager to leave the management post with less than 2 years' service, unless there are extenuating circumstances such as severe personal problems. It is also viewed as unethical for a city manager to publicly endorse a commercial product that a vendor might sell to a city. The ICMA actively enforces the code with a half-dozen or more members sanctioned nearly every year for violations (see <http://www.icma.org/go.cfm>).

Agency rules that define acceptable behaviors and practices of public employees are common place among local governments in the United States. In Kansas City, Missouri, for example, the *Ethics Handbook* issued to all city employees asserts that it is unacceptable behavior to spend several hours a week of city time to download Internet information on a relative's medical condition (see <http://www.kcmo.org/index.htm>). In California, many local governments place restrictions on their employees receiving gifts. In San Diego (<http://www.sannet.gov/>), for example, employees "shall not accept gifts, gratuities, or favors of any kind which might reasonably be interpreted as an attempt to influence their actions with respect to city business." The Town of Los Gatos' (<http://www.los-gatos.org/>) administrative regulations are even more restrictive. For example, one rule states that "no employee shall accept money or other consideration or favor from anyone other than the town for any reason."^[2]

The teaching of ethics based on codes or administrative rules of behavior such as those above stress the contents of the codes or the rules themselves, which unfortunately can sometimes become ends themselves. The teaching of codes and rules are often conducted

by training personnel within a governmental agency, management consultants, and college and university instructors, especially those in graduate degree granting programs that prepare men and women for public service careers.

TEACHING MORAL REASONING

Another approach to the teaching of ethics in public administration is moral reasoning. This approach, which is prominently advocated by Terry L. Cooper in successive editions of *The Responsible Administrator*,^[3] presumes that one can learn to reason through a difficult moral or ethical dilemma. Stated differently, learning how to be ethical in public service is just that—a learning process that, when reality sets in, can be applied with desirable outcomes.

The reasoning process set forth by Cooper puts the accent on decision-making through ethical reflection based on the interplay of moral rules, ethical principles, self-appraisal, and justification. His ethical decision-making model is shown in Fig. 1. At the heart of this exercise is what Cooper calls exercising one's moral imagination to sort through right or wrong decision outcomes.

Another proponent of teaching ethical decision-making is Carol W. Lewis who, in *The Ethics Challenge in Public Service*,^[4] presents the reader with a problem-solving guide. This guide engages the learner with real and hypothetical decision-making scenarios, self-assessment tools, and questions that stimulate ethical reflection. It contends that neither the "low" road of compliance nor the "high" road of integrity are realistic guides for navigating the often stormy political and bureaucratic environments of public service.

Fig. 1 Ethical decision-making model.

Rather, it is necessary to develop a two-pronged, systematic approach that incorporates both the path of compliance with formal standards and the path of individual integrity. She labeled this approach the “fusion route” to meeting the ethics challenge in public service.

How does one learn to engage in moral reasoning? Related, how can ethical decision-making be taught? The answer here is practice, practice, practice. That is, one can learn how to reason and make ethical decisions by practicing; the learner can engage himself with decision dilemmas and work through them. A teacher of ethics can use decision-making scenarios and small-group processes to help the learner practice ethical decision-making and acquire skill in doing so. This approach has much in common with virtue ethics espoused by Aristotle in the Age of Antiquity. Aristotle believed that one could only acquire a virtue by engaging in virtuous acts. But, he was wise to add, one does not acquire a virtue by engaging in foolhardy acts. Jumping into a lion’s cage to acquire the virtue of courage is not what he had in mind!

LEADERSHIP AND EXEMPLAR TEACHING

A third approach to the teaching of ethics in public administration centers on leadership and exemplars in public service. This approach has had a time-honored tradition in the U.S. military academies and is increasingly reflected in the curricula of professional public administration graduate schools that award the Masters’ of Public Administration degree. Some schools, such as the LBJ School of Public Affairs at the University of Texas, have established (2001) a Center for Ethical Leadership, which they believe will attract men and women who have a strong desire for public service leadership responsibilities (see <http://www.utexas.edu/lbj/research/leadership/>).

The study of leadership, of course, is rather wide reaching, and includes business, industry, political,

and educational sectors. Interestingly, however, the study and teaching of administrative leadership has been problematic as Larry Terry notes in *Leadership of Public Bureaucracies*.^[5] Several factors have contributed to this situation—the complexity of modern public organizations including the growing interdependency of private and public sector organizations, the antibureaucratic ethos that permeates American politics, and the challenge of distinguishing administrative leadership from political leadership.

Nonetheless, there is increasing attention given to this important subject and in linking it to the behavior of exemplars such as those found in Terry Cooper and Dale Wright’s edited volume *Exemplary Public Administrators*.^[6] Their book examines the life and career histories of nearly a dozen public administrators who have successfully resolved challenging ethical dilemmas. Students and teachers who use this material are able to discuss the life histories and experiences of these exemplars, relate them to their own life experiences, and therefore engage in ethical self-reflection.

In summary, Table 1 illustrates the key features of the three approaches to the teaching of ethics discussed above.

TEACHING FUTURE PUBLIC SERVANTS

The teaching of ethics in public administration described above, and other approaches detailed in James S. Bowman and Donald C. Menzel’s book *Teaching Ethics and Values in Public Administration Programs*,^[7] are promising beginnings. That more effort and results are needed is without dispute. Perhaps most revealing are the findings reported by Paul C. Light in his book *The New Public Service*.^[8] Light conducted a study of the graduates of the nation’s leading public policy and administration programs (e.g., Syracuse, Kansas, University of Southern California, University of Michigan, Harvard). These graduates, regardless of current sector of employment

Table 1 Approaches to teaching of ethics in public administration

	Sensitivity and awareness	Moral reasoning	Leadership
Focus	Moral choice among right vs. wrong behavior	Deliberation, self-examination, decision-making	Moral choice among right vs. wrong and right vs. right behavior
Substance	Rules, standards of conduct, conflicts of interest	Dilemmas, trade-offs, experience, learning	Observation and modeling
Purpose	Behavioral and legal compliance, obedience	Personal integrity, responsibility	Norm setting and following behavior
Illustrations	U.S. Office of Government Ethics and professional association codes	Cooper, Lewis	U.S. Military Academies—Oliver North’s congressional testimony

Source: Adapted from Ref.^[4].

(government, non-profit, private), placed “maintaining ethical standards” at the top of the list of skills considered important for success in their current job. At the same time, when asked if their school was helpful in teaching skills that would enable one to maintain ethical standards, most rated their education as insufficient. In fact, Light reported that this gap between how helpful a school is in teaching ethics and how important ethics is to one’s job success was the largest of all skills listed, including such important skills as “budgeting and public finance,” “doing policy analysis,” “managing motivation and change,” and “managing conflict.”

In 1989, the National Schools of Public Affairs and Administration (<http://www.naspaa.org/>), through its Commission on Peer Review and Accreditation, incorporated language in its accreditation standards (4.21) to the effect that graduates should be able “to act ethically.” Standard 4.21 has encouraged schools to put into place ethics courses or otherwise demonstrate that they are teaching ethics across the curriculum. This tightening up of the standards is promising, but evidence regarding the outcome is skimpy. A survey conducted in 2001 by the author of more than 80 of the 143 accredited programs in the United States found that many ($n = 32$) schools have increased the emphasis placed on ethics in their curriculum, but the majority ($n = 44$) have not. Some schools claim they have not increased their emphasis because they are already giving considerable attention to ethics—a claim that is difficult to validate. A sizeable majority of schools ($n = 59$) believed that Standard 4.21 is sufficient, although some express concern about its implementation and enforcement by the Commission on Peer Review and Accreditation. Only a handful of schools claim that they have developed outcome measures of their graduates ability “to act ethically.”

In conclusion, the teaching of ethics in public administration is a diverse, dynamic, and challenging enterprise that could be described as a “cottage” industry. However, there is evidence that this industry will grow in the decade ahead in both the United States and internationally. A chapter in an edited volume by Terry L. Cooper, *Handbook of Administrative Ethics*,^[9] tracked the emergence of administrative ethics as a field of study in the United States since the 1950s and leaves little doubt that more, not less

attention will be devoted to the teaching of ethics in public administration.

Internationally, there is also considerable movement as emerging Third World democracies struggle for economic and political independence, and as nations like Russia attempt to shake loose from the vice of corruption and embrace the rule of law. The United Nations (UN) has also increased its efforts to lend a helping hand. *Public Service in Transition*,^[10] a report prepared by the UN Division of Public Economics and Public Administration, emphasized “the critical importance of probity and integrity” of governments worldwide to conduct the public’s business. The UN has also developed an impressive web site called UNPAN (<http://www.unpan.org/>), which provides valuable advisory and training resources that can be drawn on for the teaching of ethics in public administration (see also <http://www.unpan.org/training-professionalism.asp>). The teaching of ethics in public administration is a robust and future-shaping enterprise.

Ethics, Feminist Perspective on

Dana Burr Bradley

*Department of Political Science and Gerontology, University of North Carolina at Charlotte,
Charlotte, North Carolina, U.S.A.*

INTRODUCTION

Since at least the 1980s, feminist philosophers and ethicists have been debating new ground in ethical theory. Feminist ethics criticizes the normative analysis of issues and concepts concerning right action, the qualities of humanitarian good, and social justice. Many different versions of feminist ethics exist, and eight major strains of feminist theory (liberal, Marxist, radical, psychoanalytical, socialist, ecological, phenomenological, and postmodern)—each with its own epistemology, ontology, and ethical implications—have been identified.^[1]

DOMINANT THEMES OF FEMINIST ETHICS

Feminist ethics criticizes the gender blindness and biases that characterize much of traditional ethical theory. For example, traditional ethics has tended to assume a public-private dichotomy, according to the primary characteristics considered to be part of the “moral point of view” of universality and impartiality, that corresponds implicitly to institutions and activities dominated by men. This has led to the questioning by feminist philosophers of the opposition between reason and emotion presumed by much traditional ethical theory. In response, the field has offered important accounts of the role of emotions in moral reason.

Feminist ethics has developed new theories and concepts that are more gender sensitive, and has worked to conceptualize issues of right action, social justice, and the human good from out of the more gendered experience of diverse groups of women. Each major strain of thought—liberal, Marxist, radical, psychoanalytical, socialist, and postmodern—attempts to address the causes and solutions its framework identifies for the subordination of women.

Liberal Feminist Thought

Liberal feminist theory traces its roots to Wollstonecraft’s *A Vindication of the Rights of Woman*^[2] and in Mill’s *The Subjection of Women*.^[3] In this paradigm, it is cultural constraints that hinder women from competing fully in the public world.

Traditional society excludes women from law, politics, medicine, and so forth because they are believed to be less capable. Therefore, liberal feminists endeavor to change this situation by insisting that women be accorded the same educational and occupational opportunities as men.

Marxist Feminist Thought

Marxist feminist thought promulgates that it is impossible to secure genuine equal opportunity within a class-based society. Private ownership of the means of production is responsible for an inequalitarian class system. A communist system must replace a capitalist system to ensure that no one would be economically subordinate to anyone else. Thus, men and women would be economic equals.

Radical Feminist Thought

Radical feminist thought, like Marxist feminist thought, stands in contrast to liberal feminist paradigms. Radical feminists believe that the patriarchal system so oppresses women that it cannot be reformed. Therefore, the legal, economic, political, social (the family), and cultural (church) institutions associated with a patriarchal system must be eliminated. In contrast to Marxists feminists, radical feminists insist that men, not capitalism, are women’s primary oppressors.

Psychoanalytical Feminist Thought

Psychoanalytical feminists also focus on gender and sexuality, but in a different way than that of radical feminists. This theoretical orientation seeks to explain differences in male and female sexuality by using Freudian-based analyses of infant or childhood experiences. Psychoanalytical feminists seek to rewrite the Oedipal drama by promoting dual parenting and dual career by heterosexual couples. This paradigm views the raising of children by both men and women as essential to promoting the universality of human values. Following this precept, children would no longer view the values of authority and autonomy as male the values of love and dependence as strictly female.

Socialist and Postmodern Feminist Thought

The liberal, Marxist, radical, and psychoanalytical perspectives are not the only ones offering paradigms for feminist ethics. The socialist feminist perspective tries to weave a coherent ideology from each of the other major perspectives. Juliet Mitchell^[4] argued that four structures overdetermine women's existence: production, reproduction, sexuality and the socialization of children. Woman's status and function in all these components must change if true equality is to be realized by women. Alison Jaggar^[5] built upon this perspective by using the concept of alienation to explain how, under a capitalist system, everything and everyone can be both a source of a woman's integration and disintegration as a person. Postmodern feminists have in turn challenged these efforts as "phallogocentric" thought and dismissive of the true diversity (from a class, culture, and race perspective) of women.

ETHICS OF CARE

The most famous of the feminist paradigm is the ethics of care first proposed by Carol Gilligan^[6]—and pursued and refined by other philosophers^[7]—in part as a response to the androcentric ethics of justice model that they view as the traditional approach to framing ethical issues. It is most closely allied with the liberal perspective, drawing upon the importance of culture in framing the experience of woman.

Noting that many feelings are as widely held as valid as rationality, the feminist care framework calls for using the women's perspective in approaching ethical issues by incorporating intuition and emotion along with reason. Feminist moral theory stresses the value of incorporating context, practical considerations, and relationship into one's ethical relationship.^[8] In feminist ethics, intimate contexts are seen as important as more global ones, because universal principles do not in actuality apply to all circumstances or individuals. Gilligan posited the mother-child relationship as the model for ethical decision making. Key elements include an emphasis on self-sacrifice for the good of the other, a concern for the well-being of the whole person, and a desire to nurture individual development and independence.

Although Gilligan's argument for gender differences received widespread attention, the assertion of systematic sex differences has not held in subsequent research.^[9,10] However, the ethics-of-care paradigm offers a contrast to the bureaucratic approach to social policy and public administration. In the latter, focus is on rules, control, formal lines of authority, and ensuring relative uniformity in service delivery. A feminist ethics-of-care paradigm promotes attention to the

individual, as well as to family, context, consideration of the uniqueness of the particular individual, and seeking solutions that fit specific circumstances rather than applying standards.

Historically, the success of bureaucratic organizations has been evaluated in terms of their precision, continuity, and technical utility.^[11] With its historical emphasis on the abstract agent, public administration leaves little room for emotion, ambiguity, and social relationships.^[12] Thus, organizational goals emphasize efficiency and effectiveness, and put less weight on context and relationships.

The traditional approach to public administration and public policy emphasizes a values-neutral perspective, and reliance upon structures and rules. This means that the application of established principles increases the likelihood that decision making is clear and applied in an unbiased manner. The downside to this approach is that strict adherence to rules in decision making may not fully account for the complexity of the problem and tends to discount the needs of marginalized populations.

The feminist ethics-of-care approach provides a different perspective by emphasizing the inclusion of many voices in the decision process. By valuing relationships, the feminist ethics of care connects the decision maker and those affected by the decisions. This leads to a viewing of more complex and contextual factors that are then explicitly incorporated into the decision process. Most important, it stresses the culture of caring along a dynamic continuum.^[13]

Feminist care ethics is not a panacea. Because this paradigm encourages the development of caring relationships within the formulation and administration of policy, there is a demonstrable problem with ensuring equality of attention, service, and care. This issue leads to an important ethical question regarding the delivery of services to individuals with established relationships to decision makers over those who are perhaps less well known, but have more pressing needs.

An additional disadvantage to the feminist care approach is that, with its emphasis on meeting individualized needs, it can theoretically be highly labor intensive or time consuming. Issues relating to accountability can also be a drawback. Most programs and services have developed recognizable benchmarks, related to measuring the program's structures or policies. A feminist care approach would challenge this assessment strategy, relying more upon an individualized approach to both service delivery and quality measurement.

Some who have assessed feminist care ethics have argued that, although it may be a powerful ethical approach for one-to-one or community-level issues, it is a less useful guide for public administration or public policy due to its emphasis on the personal and

individual contexts and its concern with individual relationships.^[14]

Liedtka^[15] described a caring organization as one in which networks of ongoing personal relationships are formed by “connected selves.” Derived from concepts in feminist ethics, she suggested caring organizations are ones that focus on persons, are ends in themselves instead of a means to profits, are essentially personal, and are growth enhancing for the members by developing people to their full capacities. Liedtka, and Dobson and White,^[16] suggested that organizations that exhibit these caring tendencies will have better economic performance than organizations based on other foundations. Dobson and White specifically suggested that a caring organization will be a place where trust will flourish because trust is required for personal relationships: “One needs to be trusting if one sees oneself as interdependent and connected.”^[16]

The feminist ethics paradigm, with its focus on contextual sensitivity, flexibility, client autonomy, and individuality, adds important elements to debates in public administration or public policy. Health care, in particular, with its current emphasis on productivity, concern for market dynamics, and a disconnect between decision making and patient input, would benefit from incorporating a feminist ethics perspective.

CONCLUSION

Bringing feminist ethical theory to reflect on specific social policies and on the development of public administration theories is productive for both theory and practice by raising important questions for each. Do feminist ethical critiques and positive concepts suggest directions for policy other than those currently on the public agenda? A feminist approach to policy and administration asks about the differences between men and women that “so-called neutral” policy evaluation has failed to highlight. Normative approaches to the gendering of policy often reveal the need for more contextual applications of principles and methods for understanding the plural identities that characterize most people’s lives. Such normative approaches also tend to show that simple alternative between

formalized equality and special treatment, and/or allowing or forbidding actions often do not adequately address feminist policy issues.

Ethics, Governance Structures

Carole L. Jurkiewicz

*Public Administration Institute, Louisiana State University,
Baton Rouge, Louisiana, U.S.A.*

INTRODUCTION

Organizational theorists, researchers, and practitioners have increasingly recognized the importance of ensuring behavioral compliance with ethical standards through a governance structure.^[1] A governance structure refers to an ethics infrastructure that contains the tools, systems, and conditions for motivating and enforcing high standards of conduct.^[2] These can take many forms, but all include systematized policies and procedures to impartially monitor compliance with an ethical code, ethical mission, or other form of articulated standards of conduct. Generally, the governance structure operates as a separate entity with an organizational hierarchy that protects it and the people working on behalf of it from repercussions of those it may necessarily investigate and discipline. The scope of its oversight can be organizationwide or focused on specific departments. Within its purview, it has the authority to create and enforce policies regarding the conduct of individuals from the highest to lowest levels of authority and responsibility. Effective governance structures are believed to reduce the number of ethical violations,^[3] strengthen organizational culture^[4] and managerial accountability,^[5] and enhance public trust in government.^[6]

The framework of governance structures assumes that a broad-based approach is most effective in ensuring compliance behaviors;^[7] policies and processes are thus targeted simultaneously to people, structure, and technology. Although the concept is rooted in the arguments of Friedrich^[8] and Finer,^[9] the theoretical foundations of governance structures can be traced to the early literature on organizational design^[10] and change.^[11] This systems approach was first alluded to as a method for moderating ethical behavior in public administration as early as 1955.^[12] In 1978, efforts to elaborate upon and refine governance structures garnered institutional legitimacy with the establishment of both the U.S. Office of Government Ethics (see <http://www.usoge.gov>) and the Office of Inspectors General (see <http://www.ignet.gov/>). Calls for substantive innovation in governance structures continue, notably with Truelson's argument for institutional controls;^[1] the emphasis on establishing appropriate ethical climates^[4,13] and systematized values;^[14] and

the introduction of transparency systems.^[15] One of the most active areas of implementation and innovation is currently in municipal governments in Europe and Africa (see <http://www.oecd.org/>).

FRAMEWORK OF ETHICS GOVERNANCE STRUCTURES

The necessary underpinning of governance structures is to ensure that the ethical standards are clearly communicated and understood.^[16,17] This includes dissemination of materials, training, updating information as appropriate, and creating accountability systems. Efforts are made to reinforce the importance of this message to the same degree in all levels of the organization.^[18] In addition to articulating the standards, specifying the repercussions of violating these standards in terms of organizational policies and legal frameworks is essential. Although laws are inflexible and generally fall short of specifying desired behaviors, they are important safety nets in governing structures.^[2] Accountability mechanisms should provide adequate control, while allowing for reasonable flexibility. Ethical wrongdoing is frequently contributed to by too many and by rules that are too complex and difficult to comprehend and follow, even for those whose intentions are to do so.^[2] Employees should understand what is expected of them in terms of ethical behavior, in terms of the scope of their decisional boundaries, and in terms of consequences if those standards are violated. Disciplinary sanctions typically range from warnings and reprimands to financial penalties and dismissal. Disciplinary measures are expected to be timely, fairly enforced, and open to public scrutiny. It is sometimes advisable to involve external institutions in cases involving individuals or issues that may be particularly intractable.

It is expected that the ethical standards communicated should be demonstrated and reinforced by officials in both their day-to-day activities, the reputation they strive to uphold, and the policies they support on behalf of the organization. Implicit and explicit commitment to ethics should be evidenced in both the spirit and the letter of their management philosophies.^[3] Particular attention is generally given to issues relating

to the use of official information and public resources, receiving gifts or benefits, and interactions crossing the public-private sector boundaries. More detailed oversight is generally given to individuals in positions that are historically more susceptible to corruption, such as procurement and human resources.^[19] Such oversight may include regulations and guidelines specific to these functions, stricter controls, and regular redeployment. Managers' decision-making processes, financial interests, and potential conflicts of interest should be transparent, and available for public scrutiny facilitated by democratic processes and with legislative oversight.^[20] This pattern of openness, referred to as transparency systems,^[15] becomes increasingly important as one ascends the hierarchy. The importance of disclosure systems, as well as a free and independent media, are essential elements in the governance structure.

Mechanisms for detection and independent investigation of wrongdoing need to be reliable, consistently employed, and subject to the same ethical standards to which the employees themselves are being held.^[21] In addition, citizens and employees should be made aware of their rights and obligations if they are a witness to wrongdoing or if they are being pressured to participate in behaviors that violate the ethical standard. Generally, the obligation involves formal legislation or organizational rules that require reporting of misconduct.^[2] Tangential concerns involve ensuring confidential methods of communication are in place, and it is clear to whom the employee should turn in such a circumstance. Safeguards to protect the whistleblower from negative repercussions from revealing such wrongdoing are of course integral to such efforts.^[22]

FUTURE DIRECTIONS IN GOVERNANCE STRUCTURES

Integration of governance structures with other organizational functions and externally with professional associations represent an area of growing interest. An overview of these various initiatives provides insight into the extent to which governance structures are integral to successful management of ethics in public administration, although no organization currently evidences all these in union.

Anticipating and avoiding ethical problems by inclusion of governance structures in organizational and departmental strategic planning sessions, change initiatives, and reform efforts^[19] is an initiative gaining widespread support. Voice is thus given to considerations of the ethical consequences of policy or priority changes as part of the planning process. This integrates governance structures in the early stages of programs and can save resources in preventing unethical

outcomes through careful planning. Shifting legislation, increasing public demands and lobbying activities, shifts in public-private sectors relationships,^[23] and changes in procurement procedures are some examples of conditions that warrant ethical scrutiny in the planning phases.^[24]

The structure of the organization or department itself can be conducive to ethical or unethical behavior and as such is a focus of governance moving toward the future.^[7] Reporting relationships, accessibility to people and information, confidentiality issues, resource distribution, privacy, and special needs are all areas affected by the physical structure. Approaching the layout and organization of a department in the planning of additions or remodeling, and routinely assessing how the environment affects the communication patterns and flow of work through the system can provide keys to areas of needed intervention.^[25] Instances of wrongdoing are analyzed in terms of where the individuals who violated the standards were physically located. Perhaps more or less privacy is needed in that area, or more secure locks or other arrangements need to be provided. Organizational structure is viewed as a preventive measure of governance structures.

Creating human resource policies and procedures that reinforce and reward ethical behavior is another new area of focus in the governance process. Communicating expectations for ethical performance in the job description, recruiting literature, the interview process, and new employee information packets is emphasized. Incorporating these behavioral expectations in measurable form in employee performance reviews and in exit interviews^[26] is equally important in reinforcing the type of ethical behavior expected in the workplace. Individuals selected for rewards or promotions are those who represent in practice and philosophy the ethical standards supported by the organization.^[26] Offering organizational rewards for outstanding skill in managing the ethical aspects of public service is another method of reinforcing desired behaviors. At the core of effective preventive elements of governance structures is to create outcomes for being ethical that outweigh those for being unethical.^[27] Of course in organizations where corruption is rampant, enforcement is more important in the short run, but in organizations where instances of misconduct are minimal, prevention is a more valuable method of governance. Prevention purportedly is less expensive in the long term, has a more positive impact on the culture of public service, and reduces cynicism toward corrupt public service by a civil society.^[28]

More broadly within the human resource function, attention to confidentiality of records, guarded access to employee and insurance information files, equanimity of treatment in evaluating applications and training managers on the ethics of interviewing and

hiring protocol are given equal attention. The way in which an employee is recruited, hired, and socialized into an organization or department establishes a self-governing standard that can supplement the institutions' ethical governance measures.^[29] Monitoring of electronic and voice communications is an increasingly common form of governance activity.^[30,31] Employees are generally made aware of this policy and practice upon employment, and are asked to sign a statement acknowledging familiarity with this policy. It is also important to review personnel policies and procedures annually, and to report the assessment's findings publicly as part of the transparency structure.^[32] The effort spent in this regard represents the balance between prevention and enforcement; sound governance policies include both.

An independent ethics forum is another form of effective governance. Such forums are generally informal luncheon sessions that meet regularly on a weekly or biweekly basis, depending on interest. Invitations to attend are distributed via an intranet messaging system or through memos. Attendance is voluntary, and a culture of open discussion is established whereby ideas or concerns related to ethical issues faced on the job or in theory are put on the table for discussion. All attendees have an equal voice in discussing the issue, generally with an unbiased facilitator present. No records are kept of the meeting and those attending are asked to keep all conversations confidential, a request enforced through organizational sanctions. Attendance by individuals up and down the hierarchy is encouraged, and having representation from the highest levels of management offers validation and perceived importance to the group. This also demonstrates that ethical issues occur at all levels in various forms, and knowing that individuals are not isolated in such occurrences has been shown to facilitate their seeking external advice and supporting transparency systems. A culture of openness is established and safeguarded. Such forums allow for individuals to practice the language of ethical discussion, become aware of the complex issues that usually surround a concern, and provide practice in resolving and addressing ethical dilemmas that carries over into daily practice. These interactions tend to instill confidence in attendees that they can deal with a seemingly insurmountable ethical challenge and that there are objective methods in doing so. These forums are not intended to absolve managers, departments, or organizations from ethical oversight, but rather to act in concordance in support of their efforts.

Phone and electronic hotlines for whistleblowers are a relatively new development in supporting governance measures. These are generally monitored by an outside agency or organization that does not trace the source of the information and passes along the information with all identifying traces removed. If a reward system

is in place to encourage whistleblowing, this agency generally provides a code number to the informant. The information along with the code number is reported to the organization. If, after investigating the issue and determining it was a legitimate concern, the reward is made available at a bank where the informant need only present the preassigned code, with no other identifying information. Notice of the award is posted in company newsletters or on web sites, and the informant usually has 6 to 12 months to claim it. The outside agency chosen for this initiative must be monitored for strict confidentiality compliance procedures. There is some debate over the efficacy of such hotlines,^[33] and results are inconclusive.

Professional associations or unions are another element in establishing governance structures for ethical behavior. The ethical codes they develop and support, the importance given a standing ethics committee, and the strength with which they communicate and enforce professional ethical standards can work in concert with intraorganizational systems governing ethical behavior. However, tensions can result over a conflict between association codes of ethics and governmental codes of ethics. This is often the case with bar associations' codes regarding confidentiality, although attorneys working for the federal government are obligated to protect government interests over such individual obligations. Effective role modeling can evolve from these opportunities to share ideas in professional forums. Training by ethics professionals external to the organization frequently occurs at such meetings and can be a valuable aspect of membership supported by the institution. Individuals can be asked to share these materials upon their return, becoming in turn recognized for their enhanced expertise in a specific area.

Internal controls such as annual or semiannual reviews leading to recommendations for improving management processes or procedures can directly inform the organization and general public of steps to strengthen governance structures. The goal of governance structures is to keep public servants accountable for their actions and to remove opportunities for ethical compromises to occur. Independent scrutiny such as legislative reviews, regular management audits, inspectors general or ombudsman investigations, and specific judicial and ethics reviews are increasingly popular methods of oversight.^[28]

Governance structures themselves are most often subject to independent scrutiny as a monitor of their due process and compliance with the same ethical standards they are charged to enforce. Bias, regardless of whether intentional, can be revealed by overt reviews for fairness and objectivity, as well as audits of the process and procedures for handling complaints. External reviews not only instill confidence in the governance

structure by those subject to them, but they also encourage double-loop learning on the part of those charged with ethical oversight. As a consequence, they are more likely to review their own behavior and the patterns in that behavior and adjust accordingly, knowing that authoritative others will be viewing their actions from that framework.^[34,35]

Evolutionary Theory and Public Policy

Steven A. Peterson

School of Public Affairs, Pennsylvania State University at Harrisburg,
Middletown, Pennsylvania, U.S.A.

INTRODUCTION

For some 25 centuries, the “nature of human nature” has been the central issue in Western political thought. Fully aware of that issue’s crucial importance, many of our greatest political philosophers made it their explicit point of departure. Although not always as readily recognized, much the same has been true in the formulation of public policy. With few exceptions, the policies adopted in a given polity reflect and flow from the views about human nature held by those charged with setting those policies. The reason is quite simple. Almost invariably, the measures proposed to deal with social, political, and economic problems stem from some (often unarticulated) conception of human nature and a corresponding set of assumptions about the likely consequences of governmental efforts to encourage, redirect, limit, or even prohibit a given type of social, political, or economic behavior.

For at least the past 50 years, the so-called standard social science model (SSSM) has dominated the behavioral sciences and directly and indirectly influenced public policy.^[1] The SSSM insists that for all practical purposes, human nature—and thus human behavior—is shaped by *culture*. The SSSM rests on three cardinal tenets—two of them explicit, the third usually implicit. These are: 1) that humans have no innate behavioral tendencies; and 2) that, consequently, human nature is solely the product of learning and socialization (in short, of “nurture”); from which it follows 3) that human nature (and consequently human behavior) is essentially quite malleable.^[2]

Long the reigning paradigm, SSSM has recently been challenged by an evolutionary model (EM) that challenges the tenets on which the SSSM is based. The EM agrees that culture *is* important—but so are the genetically transmitted behavioral tendencies that our species has evolved over millions of years (“nature,” of course). Given this reality, *both* nature *and* nurture must be taken into account if we are to understand why humans act as they do. The idea that our evolutionary past may sometimes significantly influence how we act today leads to a distinct conception of the wellsprings of human behavior and of human nature itself; in turn, this often leads to different conclusions about the issues that governments should address and of the policies best suited to deal with

those issues. Two key questions emerge from the preceding general comments: First, how does the EM paradigm differ from that of the SSSM in its understanding of human nature? Second, what are the implications of these differences for the formulation of public policy? Extant literature suggests the role of biological factors in public administration^[3,4] and policy.^[5–7] This article builds on such prior research.

KEY DIFFERENCES IN UNDERSTANDING HUMAN NATURE

The two models differ in several respects in their respective approaches to human behavior and nature. Among these are: 1) the role of culture in shaping behavior; 2) genetic factors as behavioral influences; and 3) the relevance of primatological data. Not surprisingly, these conflicting views eventuate in a basic parting of the ways with regard to the malleability of human nature—and of human behavior.

We will very briefly examine these in the order listed.

The Role of Culture in Shaping Behavior

The importance of culture as a factor in shaping human behavior is probably the most commonly misunderstood aspect of the EM. As noted above, the SSSM holds that for all practical purposes, human behavior is the product of culture; the EM differs significantly in that it looks as well at the extent to which behavior might also be influenced by our evolutionary legacy as social primates. But far from denigrating culture, the EM stresses that ours is the only species that has evolved the capacity for developing anything more than a very rudimentary culture. Even more to the point, it emphasizes that *Homo sapiens* is the only species capable of creating and, in many circumstances, then acting in accordance with beliefs that actually *run counter* to some very powerful innate behavioral tendencies.

The point need not be belabored. One model holds that to understand human social behavior, we should look only at culture; the other contends that we should—in fact, must—also consider the possibility

that evolution has endowed us, *as it has all other species*, with innate propensities which often influence that behavior.

Genetic Factors as Behavioral Influences

In light of what has already been said, the discussion here can be quite brief. Beyond doubt, culture plays a very important role in shaping how we act—but so do genetically transmitted behavioral tendencies evolved over literally millions of years. Some of these are probably unique to our species—language, culture (in any “rich” sense), and, surely unique, often a willingness to sacrifice ourselves in behalf of some religious or secular belief.

However, there are other proclivities that we share with most of our fellow primates. Among these are hierarchical social structures characterized by dominance above and submission below, status seeking, aggression, selfishness, an aversion to celibacy and an often-reluctant and unreliable commitment to monogamy,^[8] xenophobia, ethnocentrism, and nepotistic favoritism. These behaviors have become part of our genetic legacy because they have served on balance, to maximize the “inclusive fitness” of our ancestral fellow speciates—and the fellow speciates from which they, in even earlier times, evolved.

Use of Primatological Data

The divergence between the two models on this point is eminently reasonable. If, on the one hand, human behavior is shaped almost entirely by culture and socialization, information about other species, no matter how closely related biologically, serves no useful purpose since it does little or nothing to further our understanding of human behavior. On the other hand, if our genetic legacy meaningfully influences how we act, then the study of closely related species (and especially the apes) that share much of that legacy becomes important to consider.^[9,10] Boyd and Silk^[11] make clear the value of understanding primate behavior for understanding human behavior. In short, primate data may well have relevance for human policy choices.

Reflections

The difference here between the two approaches is not black or white, all or none. Within each camp, there are gradations of belief and, no doubt, considerable overlap of opinion. The fundamental disagreement between the two models is on the factors that shape, if they do not actually determine, human nature. Given their divergent positions on this issue, other differences are almost inevitable. For the SSSM, human nature

and thus human behavior is essentially the product of culture—and it is to culture alone (i.e., nurture) that the behavioral sciences should attend. For the EM, both culture and genetically transmitted behavioral tendencies (i.e., nature) are operative and, consequently, both need fall within our purview.

They differ on the nature of human nature. With its emphasis on culture, the SSSM comes close to the Lockean *tabula rasa*^[12] with humans as blank slates upon which culture and experience inscribe their dictates. For the EM, evolution has endowed our species, as it has all other forms of life, with behavioral proclivities (ranging from aggressiveness to xenophobia); culture may strengthen these proclivities; on occasion it may override them; but in either event they significantly influence our actions.

Closely related to this, of course, is the question of human malleability. Those who believe in the SSSM are much more optimistic about the possibility of altering human behavior than are advocates of the EM who, as did Edmund Burke, give greater weight to the inherent limitations of human nature and of the human mind.

As might be expected, these conflicting conceptions of human nature and human behavior yield dissimilar approaches to social, economic, and political problems. The SSSM, more sanguine about the prospects of appreciably modifying human behavior and our capacity to direct and control the course of events, is more inclined to think in terms of solutions; the EM, in contrast, tends to see problems more in terms of constrained options, difficult trade-offs, and uncertain outcomes. It would be remarkable if the policies advocated by the devotees of one of these models were not frequently at odds with those favored by partisans of the other.

POLICY IMPLICATIONS

One can argue that an EM yields a much more realistic understanding of human behavior than does the SSSM—although this latter model has long dominated our approach to political, social, and economic problems.^[17] We explore this issue through illustrative case studies.

Prostitution Laws

One case study of the different take on policy from an EM as opposed to SSSM perspective is prostitution laws. McGuire and Gruter^[12] note the following:

1. Males will continue to seek sexual partners, including prostitutes, as a result of evolved predispositions.

2. Females will exploit such males to receive resources, probably as a result of evolved predispositions.
3. Laws prohibiting prostitution are likely to fail, given that such prohibitions conflict with evolved predispositions.

As a result of these conclusions, the authors suggest that a form of legalized prostitution makes the most sense, using the EM. The SSSM assumes that aversive legal sanctions would deter people from engaging in prostitution or soliciting the services of prostitutes. However, McGuire and Gruter contend that this is unlikely to succeed. Better to use our understanding of human nature and create laws that meet societal goals with some reasonable degree of success. They say (p. 38):

Given these points, limited legalization seems the best evolutionary-based response. Limited legalization (e.g., registration of sex workers, regular health check-ups) has the social advantage of reducing the transmission of diseases, perhaps reducing criminal involvement, and bringing sex workers into the work force...

Thus, here is a case study that has EM proposals moving in quite a different direction than standard SSSM proposals as adopted in the United States.

Drug Laws

Blank^[13] has advanced an argument that brain chemistry raises questions about the SSSM logic underlying aspects of our drug laws.

1. Addictive behavior regarding drugs is easily explained by brain neurochemistry, including the use of alcohol and nicotine.
2. The findings, largely on drug addiction, may be generalizable to other addictive behavior, such as gambling, aggressive behavior, and the like.
3. Standard assumptions that willpower is enough to control addictive craving are probably inaccurate.

Blank, at one point, notes the following policy implication (p. 68):

This evidence also has implications for drug policy that makes distinctions among potentially addictive substances. Arguments for legalization of marijuana become more difficult to accept given this evidence....

Moreover, society's treatment of nicotine and alcohol may have to be modified if consistency is sought.

Laws based on assumptions of rational behavior by drug users, i.e., punishment will deter the activity, may well be mistaken, once the EM is taken into account. Given the brain's neurochemistry, sheer dependence on rational choice deterrence theory, as per the SSSM, may not be good policy.

Criminal Justice Policy

Ellis^[14] has explored the relevance of brain functioning for criminal behavior and criminal justice policy. His basic contentions:

1. Male sex hormones (androgens) affect the probability of victimizing behavior. Higher levels of androgen go with greater aggressiveness, impulsiveness, and potentially antisocial victimizing behavior.
2. Most people, with normal cortical control of many of their impulses, learn how to express their competitive/victimizing urges in ways that are not apt to elicit response from the criminal justice system; those who cannot control their impulses, on the contrary, are more likely to attract the attention of the criminal justice system as they "act out."

Policy implications? For those who cannot control the impulses generated by androgens, prescription drugs ought to be used to reduce the harmful, anti-social effects of androgens. That is, drug therapy would then reduce levels of victimizing behavior. In part, this logic emerges from a rejection of the SSSM view that deterrence can come from harsh and timely punishment. If Ellis' theory is correct, this SSSM assumption is not appropriate if we are to extirpate the victimizing behavior from individuals prone to commit such actions.

CODA

An EM, then, may yield different understandings of human behavior than does the SSSM—although this latter model has long dominated our approach to political, social, and economic problems. Of course, humans are eminently cultural beings as well as the products of natural selection. Indeed, culture is a product of evolution. This adds a complex layer on to our understanding of evolutionary-constrained policy choices, since we know that culture can override

biological impulses (as witness mass suicides, such as at Jonestown and Masada). Nonetheless, it seems clear that human evolutionary history needs to be accounted for in assessing policy choices.

Executive Budgeting

Brendan F. Burke

*Department of Political Science, Bridgewater State College,
Bridgewater, Massachusetts, U.S.A.*

INTRODUCTION

Executive budgeting resides within a tension opposite budgetary institutions and strategies that emphasize a decentralized, legislative focus. As part of a continuum of budgetary authority, an executive budget scheme centralizes agency guidance, information gathering, and decision-making authority to one actor at the height of the organizational hierarchy. Budgeting always involves the reconciliation of diverse needs and desires with scarce resources into a single plan; the range of possibilities for budget process design parallels the grant of authority to the varied interests and their sponsors or advocates. In an authoritarian system, it is possible that the executive, monarch, dictator, or other single leader aggrandizes all power over competing interests in the budget. The American experience at all levels of government has involved give-and-take over unified executive authority and dispersed, pluralistic designs.

This article describes the original thought of the framers of the U.S. Constitution over centralized vs. dispersed budgetary authority, as well as practical developments that determined the contemporary place of executive budgeting at the subnational levels of government, in turn. The order of treatment is chronological. The Progressive reform wave in the early 20th century involved changes in executive fiscal authority initially at the local government level (around 1910). The states have modernized their administrative capacity especially since the 1950s. Budget reform in favor of the executive came in alterations to the governor's ability to prepare and present a budget, as well as in their veto powers to oppose unwanted legislative priorities. Some of the states have chosen to centralize budgetary authority in the executive's hands, while others retained a decentralized budgetary system.

HAMILTON'S VISION OF EXECUTIVE BUDGETARY POWER

The American Revolution was fought to bring the American people from a dictatorial system of resource acquisition and allocation, whereby the colonists had

little to no determining role in the scope of the Crown's taxation or in the use of fiscal resources. The state constitutions written between 1776 and 1780 renounced central authority, limiting the abilities of the governors to a custodial role except in times of war. The difficulties of coordinating state action under the Articles of Confederation led to the Constitutional Convention's focus on a balance between some centralization of executive authority, while maintaining broad representation in the national legislature. Article I, Section 8 clearly stipulated the initial dominant role for Congress in budgetary affairs, as it would raise "Taxes, Duties, Imposts, and Excises," hold responsibility for debt obligations, "coin Money," arm the military, and build post offices and roads. The president's powers included the commanding of the military, establishment of treaties, and appointment and reporting of executive agencies.

James Madison's and Alexander Hamilton's writings in the "Federalist Papers" embody the contrasting thought between shared and centralized or executive powers in all areas, including fiscal affairs.^[1] In Federalist #30, Hamilton discusses the need for national taxation and resources especially in times of war, and in #31 expands upon the national government's need for taxation beyond the states' abilities, to support other shared public priorities: "A government ought to contain in itself every power requisite to the full accomplishment of the objects committed to its care, free from every other control but a regard to the public good . . ." (193). In Federalist #70, Hamilton specifies the need for a "vigorous executive" who does not compete with equal authorities to determine the means of achieving the public good. Competing leaders will "lessen the respectability, weaken the authority, and distract the plans and operations of those whom they divide." Accountability, the assignment of blame and punishment when mistakes are made, is rendered incomplete with plural authorities.

At least at the time of the ratification of the Constitution, the support for Hamilton's thinking was limited to endorsement of a powerful central government, but not of a powerful single executive. Madison's arguments presented between Federalist #47 and #51 appear to have prevailed in 1787. In Federalist #47, Madison advocates for a division of

executive, legislative, and judicial powers to counteract the potential for tyranny. In a budgetary sense, this would mean that the legislature would determine spending plans, and the president would execute the spending. Neither party should prevail over the other, as “ambition must be made to counteract ambition.” (Federalist #51) Under the system of separation of institutional powers, Madison’s necessary safeguards are in place. But at the same time, unified accountability for spending is lost, as many individuals are responsible for the codification of expenditure needs and final approval of the budget.

THE RISE OF PUBLIC ADMINISTRATION AND EXECUTIVE AUTHORITY

Between the late 18th century and the beginning of the 20th century, there was little need for change in budgeting at the national level. The size and scope of government and its fiscal resources were limited, and the jobs of Congress and the president were only beginning to grow in complexity. At the local level, however, the rise of the political machine and the machine’s corrupt administration prompted a need for centralization and accountability in budgeting.^[2] Academics led by Woodrow Wilson and Frank Goodnow specified a stronger role for executive-focused administration, and organizations like the National Municipal League and New York City’s Bureau of Municipal Research proposed new institutional designs in favor of executive authority.

The Progressive movement put forward strains of thinking to combat corruption and inefficiency in American society, one focused on the advancement of citizen support and participation, and the other on the establishment of business-like principles in government.^[3] Woodrow Wilson’s article “The Study of Administration” and Frank Goodnow’s book *Politics and Administration: A Study in Government* emphasized the latter theme, advocating for a responsible executive authority. Wilson rendered a comparison between “the confusion, sinecurism, and corruption” in Washington, D.C., and the greater responsiveness of administrative systems in France and Prussia. Our own English roots had established “the art of curbing executive power to the constant neglect of the art of perfecting executive methods.” The balance to be struck would involve the establishment of greater administrative efficiency while still honoring the will of public opinion. Goodnow would formalize the split between a legitimizing force in political boards and bodies, who would then hand the task of carrying out their dictates to the executive. All aspects of government outside the legislative and judicial activity would fall within the administration—a broad

responsibility specified as the “executing of the will of the state.”^[4]

Specific designs for more centralized, executive-driven budgeting would fall to professional think tanks, which created reformed government structures and budget processes. The National Municipal League was formed in 1895 out of 46 “Good Government” clubs and associations to confront machine politics. Soon it unveiled its model city charter, which recommended a strong mayor-type government with a unicameral legislature and expanded executive authority. The New York Bureau of Municipal Research, under William Allen, Henry Bruere, and Frederick Cleveland, designed and advocated for consistent accounting systems as a building block for rational budgeting. The model budget that emerged was based on Frederick Taylor’s “scientific management,” whereby the most efficient allocation of resources would be used in the most effective manner, as derived through rigorous analysis of work situations. At the same time, the budget was seen especially by Allen as a tool for public education.^[5] Harkening back to Hamilton, the reformed budget design would offer greater accountability, as it would come from a single executive, clearer priorities with a more streamlined focus, and a standardized accounting language to enhance clarity within the appropriation figures. The council-manager form of government also emerged from the National Municipal League during the 1910s as a model based on communities like Staunton, Virginia, Sumter, South Carolina, and Dayton, Ohio, all of which experimented with a “business manager” design to run public affairs. The council-manager form embodied Goodnow’s politics-administration dichotomy, whereby the elected board would pass policies and the appointed administrator would hold full authority to staff and fund implementation efforts.

The council-manager form of government would spread rapidly, becoming the chosen institutional structure in almost half of American cities with populations greater than 2500.^[6] The budget process in these municipalities tends to begin with the town or city manager establishing revenue availability and important trends in expenditures, then imparting them to the guidance of service managers and agency heads for the preparation of budget requests. The managers may simply state revenue and expenditure constraints, or may restrict agencies to requests limited by a specific growth rate. Analysis of needs and requests is carried out by the manager’s personal staff, who also derive recommended funding levels for managerial review and approval. Elected officials enter the budget process either with broad input regarding their own priorities at the outset of the budget process, or when the completed budget is transmitted to the elected board for their scrutiny and adoption. Elected officials have the

authority to add and subtract priorities from the manager's budget, but their review comes near adoption deadlines, on an established and carefully crafted product.^[7] The national and state governments also have contemporary versions of executive budgeting, but they are less dominated by the chief administrative or executive officer than are the council-manager form of government.

COMPARING EXECUTIVE-FOCUSED BUDGETING ACROSS JURISDICTIONS: GUBERNATORIAL POWERS

Most of the American states have revised their constitutions extensively through the second half of the 20th century, including in ways that enhanced executive budget authority for some governors. But different states have different levels of tolerance for a stronger executive, and thus constitutional revisions on behalf of gubernatorial budgetary powers form an interesting contrast in three different areas: the governor's ability to reorganize government structure; the governor's ability to craft the budget prior to legislative consideration; and the governor's ability to veto legislative budgetary priorities. The variation may arise because different states have different political cultures, including contrasting levels of acceptance for executive

power or different emphases on broad representation. Almost all states have moved toward enhanced executive budgetary authority, but to varying degrees and at varied paces. A depiction of the range of gubernatorial powers on budgetary matters is provided in Table 1.

The states tended to be slower than municipalities and the national government at modernizing their organization structures. Beginning in 1917, the state of Illinois reshaped its functional alignment, reducing the number of agencies and creating fewer independent authorities. Many states followed suit, but the pace of change was slow. This is important to the governor's budgetary power because the governor does not have the authority to propose expenditures, or constrain them, within the agencies that serve independent boards.^[8] In some states, such as in Massachusetts, the governor can recreate the organization chart based on constitutional authority. The governor can make his or her proposal, which will pass if it sustains a veto from both branches of the legislature. But at the other end of the spectrum, states like South Carolina only allow the governor to submit their reorganization design as a regular legislative bill, subject to amendment and veto by a single house of the legislature. This is not to say that the governors of Massachusetts automatically fare better than the governors in South Carolina. In the 1980s, Governor Carroll Campbell was able to streamline a convoluted and unaccountable system of agencies with the help of his legislature. This reorganization brought

Table 1 Budgetary powers of the governors (highest to lowest power, in the order)

	Score
<i>Governmental reorganisation</i>	
Governor's reorganization power is based in constitution, with legislative veto needed by both houses	5
Based in constitution, with legislative veto needed by only one house	4
Based on statute, with legislative veto needed in both houses	3
Based on statute, with legislative veto needed by only one houses	2
Based on statute or is informal, subject to normal legislative bill consideration	2
<i>Budget development</i>	
Governor has full responsibility, legislature may not increase executive budget	5
Governor has full responsibility, legislature can increase by special majority vote or subject to item veto	4
Governor has full responsibility, legislature has unlimited power to change executive budget	3
Governor shares responsibility, legislature has unlimited power to change executive budget	2
Governor shares responsibility with other elected officials, legislature has unlimited power to change executive budget	1
<i>Veto power</i>	
Governor has an item veto and a special majority vote of the legislature is needed to override a veto (three-fifths of legislators elected or two-thirds of legislators present)	5
Governor has item veto with a majority of the legislators elected needed to override	4
Governor has item veto with only a majority of legislators present needed to override	3
Governor has no item veto, with a special legislative majority needed to override a regular veto	2
Governor has no item veto, only a simple legislative majority needed to override a regular veto	1

many independent commissions under the governor's control, so that they would submit their budget requests through the executive office for review and analysis.^[9] In 2003, Massachusetts Governor Mitt Romney was denied the ability to bring state spending under control (especially in the university system) because of opposition by both houses of the legislature to a major reorganization plan.^[10]

The governors operate under a similar system of separation of powers as is found in the U.S. constitution, and they tend to have the same ability to propose budgets as the president. The governor has the responsibility of writing the initial budget with the help of a staff, and the legislature has unlimited powers to change the governor's proposal. But this has not always been the case. In some states, the governor's power to write the budget was shared with the state treasurer, or even with an elected governor's council. New Hampshire still has the council, elected by district, that reviews gubernatorial appointments, but over time, the state narrowed budgetary responsibility to just the chief executive. In some ways, the New Hampshire (as well as the Vermont) governor is limited in budgetary authority because he or she is only elected to two-year terms; every other budget is overshadowed by the governor's election campaign.

While most states reformed the executive budget proposal process to be equivalent to the president's, four state constitutions grant their governors greater powers of proposal tied to an ability to limit expenditures. For example, the Maryland and West Virginia legislatures can only revise their governors' budgets downward; these executive budgets establish the ceiling on expenditures. Thus in these states the governor cannot guarantee the funding of specific priorities, but he or she alone can establish limits to the scope of government spending. In New York and Nebraska, a special legislative majority is necessary before increasing spending levels beyond the governor's budget. This grants these two governors a greater constitutional authority to constrain budget growth than in 46 states and the national government.^[11]

The veto power adds to the governor's ability to constrain expense (as well as policy excesses). North Carolina was the last state to write the gubernatorial veto power into its constitution, beginning in 1997. Forty-two state governors have the line-item veto power, granting them the ability to delete unwanted priorities from legislative appropriations. Some states, such as Wisconsin, add an additional constraint, whereby the legislature needs a supermajority (three-fifths of legislators, or two-thirds present at a given session) to override the veto. Governor Tommy Thompson, during his 14-year reign in Wisconsin, used the veto 1900 times. Not once were his vetoes overturned by the legislature.^[6] A strong veto is another

constitutional tool that gives the governor the ability to revise the legislature's budget downward, tipping the balance of budget authority toward the executive in most American states.

CONCLUSIONS

The framer's debate during the writing of the U.S. constitution, the Progressive reforms at the local level, and the contrasting powers granted to the states' governors assist in the construction of a multidimensional definition of executive budgeting. The components include:

- Accountability: a single elected or appointed administrator takes responsibility for an overall revenue and expenditure plan.
- Centrality: budget requests filter through a single department or office, such that coordination of related programs is possible and duplication of spending is reduced.
- Control: the single authority can propose and enforce limits on spending.
- Reorganization: disparate independent organizations can be unified under the single budget process.
- Regulation: the single executive can establish consistent procedures for the provision of information underlying requests, standards for review and analysis, and uniform presentation and allocation.
- Analysis: more detailed and rigorous analysis is possible if all requests are submitted to a higher standard of scrutiny; the inequity of intensively auditing some agencies, while ignoring others, is less likely to occur.
- Comparison: a single unified budget process enables decision makers to envision all parts of the organization subject to budget review simultaneously.
- Citizen control: a streamlined budget process makes it easier for citizens to understand their government and its resources, and to give credit or assign blame in the event of governmental successes and failures.

There are also advantages to a pluralistic budget process design, with regard to representation, potentially concerning discourse and transparency, and depending on the definition, possibly with regard to a decentralized vision of accountability. These debatable benefits justify the mixed budgetary authority found in the majority of American governments.

Executive Leadership in Local Government

James H. Svara

*Department of Political Science and Public Administration, North Carolina State University,
Raleigh, North Carolina, U.S.A.*

INTRODUCTION

Executive leadership is a complex topic in local government because of uncertainty about the scope of this type of leadership and variation in the officials to which it is assigned. This is especially true in the United States, where different forms of government are used in local governments. In simplest form, the topic encompasses the leadership provided by persons in the highest positions in the governmental structure who have responsibility for discerning the preferences of citizens and mobilizing popular support for policies, for developing proposals for what government will do, and for directing the work of the government. The citizen dimension might be considered beyond the scope of a type of leadership that is associated with activity within the governmental and organizational structure. Connection with the citizenry is, however, essential to democratic governance and creates the foundation for the internal executive functions.

Handling some or all the executive responsibilities falls to mayors (and their equivalents in counties) in all governments and in many governments to appointed chief administrators as well. Although it is natural to associate executive leadership with one person who has responsibilities that range from the electoral to the managerial aspects of leadership, in local government, executive leadership broadly defined is commonly shared more or less widely. In view of this division of leadership functions, the discussion is presented in three sections that deal with mayors who are elected executives, non-executive mayors, and appointed executives. For simplicity, and in recognition that the preponderance of the literature on leadership in local government has focused on cities, terms from city as opposed to county or other types of government are used to refer to the officials.

The division of responsibility depends largely on the form of government and, within mayor-council cities, on whether there is a chief administrator present in the governmental structure.^a Connecting with citizens

and mobilizing popular support for proposals is the responsibility of the mayor in all forms of government. Policy leadership (i.e., determining the purpose and policies of the government) is the responsibility of the mayor with approval of council in mayor-council cities, the mayor with advice of chief administrative officer (CAO) and approval of council in mayor-council-CAO cities, and the mayor, council, and city manager in council-manager cities. Finally, administrative leadership or directing the administrative apparatus and work of the staff is handled by the mayor, mayor and CAO, or the city manager, depending on the form of government.

Most cities have one executive and one mayor, but the two offices are not necessarily combined.^[1] Cities that use the mayor-council form of government vest all or some executive powers in the elected mayor, who is the political head of city government, the driving force in setting policy, and in charge of the administrative organization. The executive mayor with full powers ultimately has authority of hiring and supervising staff, formulating and (after approval by the council) expending the budget, and directing the organization, subject to the limitations set by the city charter. If the city has a chief administrator, some administrative functions are delegated to this official. In council-manager cities, the city manager—an executive appointed by the city council—makes a major contribution to policy making and exercises administrative powers. Managers have extensive contact with citizens, are somewhat attentive to popular preferences, and have subtle influence on public opinion. Still, city managers do not get directly involved in mobilizing public opinion or shaping public support, unless instructed by the council to do so (e.g., seeking to secure votes in a bond referendum approved by the council). Council-manager cities also have a mayor who is the political head of the government and presides over the city council, but usually has no powers other than those available to other members of the council.

ELECTED EXECUTIVE MAYORS

The mayor-council form of government is based on separation of powers with authority divided between

^aLargely excluded from the discussion are weak-mayor council forms in which executive functions are spread across a number of offices and boards in city government and small-town mayor-council governments in which executive functions are shared and there is sharing of tasks between elected officials who do a lot of the work of city government and part-time staff.

the executive and the legislature. The strong mayor–council version of this form has separation of powers between a mayor with extensive powers and integrated administrative control over staff, and the elected legislative body. The lines of authority for all or most departments of city government lead to the mayor's office.

In contrast, the council is confined to a more limited role in strong mayor–council cities. Even in policy making, the council is heavily dependent on the mayor for proposals and information, and it can be checked by the mayor's veto power. The mayor also occupies a favorable position for mobilizing public opinion in support of proposals. The council, however, must approve policies and can override vetoes, so there is the potential for the council to overrule the mayor if there is a large (i.e., veto-proof) like-minded majority on the council in opposition to the mayor, or for deadlock between the executive and legislature if a narrow majority opposes the mayor.

The checks and balances in mayor–council cities affect how officials relate to each other and the freedom of mayoral action. Because the purpose of offsetting powers is to permit one set of officials to hold the other in check, it is common for conflict to arise in the relationship between the mayor and the council (see Ref.^[2]). The conflict may concern policy preferences and priorities, administrative performance, and the extent of independent executive authority assigned to the mayor. Separation of powers can allow the departments of city government to play the mayor and council off against each other and develop their own base of constituency support that produces greater autonomy vis-à-vis the mayor.^[3] Strong mayors have the potential to blend the dimensions of leadership. They can tap organizational resources and mobilize public support to advance their political agenda. The executive can face the challenges of overcoming council resistance or opposition and recalcitrance from city departments, but may be able to use threats or inducements to win support.

In the political science literature, the ideal mayor in mayor–council cities is an innovator (also called an entrepreneur) who provides creative solutions to problems and pyramids resources to increase the ability to build coalitions and gain leverage over other actors.^[4,5] This mayor is effective at both initiation and implementation of policies and programs. Leadership is fashioned from a combination of formal and informal resources. The former are part of the governmental structure and official policies of city government. The latter are derived from personal characteristics or the political process. Formal resources available to mayors remain fairly constant over time, but each incumbent differs in their ability to make the best use of these resources. Still, some important

informal resources, for example, support from a political party, have been declining over time.

The terms “strong” and “weak” mayor refer to the level of authority assigned to the mayor, but there is no “pure” strong or weak mayor form. Strong and weak mayors are arrayed along a continuum. The key formal powers, which may be assigned to the executive or divided among a number of officials, are appointment of department heads, developing the budget, directing the administrative departments, and veto of council actions. The mayor's authority varies widely. Beyond the organizational leadership resources that are derived from appointment of department heads, control of other appointments can augment the mayor's leverage, and patronage appointments can reinforce party organizational cohesion and support. Most mayors, however, do not directly control large numbers of city government jobs. Civil service protection of most positions limits the jobs a mayor can dispense. Court cases since the 1980s have limited the ability of elected officials to remove, promote, or transfer staff for partisan reasons, unless employees are directly involved in providing advice on policy strategies, as opposed to policy implementation.^[6]

A 1991 survey conducted by the International City Management Association measures the variation in mayoral authority within the mayor–council form of government.^[7] In cities over 100,000 in population, two-thirds of the mayors develop the budget, and approximately 90% appoint department heads and have veto power. In cities under 50,000, the likelihood that the mayor possesses these powers decreases with declining population. Mayor–council governments of most moderately large to large cities generally correspond to the strong mayor–council form, whereas medium-size mayor–council cities are divided between strong and weak mayoralties. Small cities with the mayor–council form approximate the weak mayor–council form of government.

The formal resources of the mayor's office provide only part of the explanation of effective mayoral leadership. Even in mayor–council cities, informal resources are extremely important. Mayors such as the first Richard Daley in Chicago^[8] and Richard Lee in New Haven^[9] were noted for their ability to convert a formally weak position into one of strength. Support from a political party or community elites, strong popular backing, and a host of private backers indebted for jobs, favors, contracts, and recognition can give mayors the added political clout that can be helpful in dealings with the council and their own administration to get ideas accepted and acted upon.

Several trends in American politics have reduced these informal resources of the mayors and made it more difficult for mayors to use their influence.

First, the declining strength of political parties and the increasing independence of voting behavior by citizens remove a force that mayors could use to bind together office holders and secure support for the mayor's program. Second, there has been a splintering and thinning of power elites resulting from the breakup of large corporations, takeover of local firms by national and international concerns, increased competition and downsizing, and the move of companies to the suburbs. Third, the proliferation of interest groups and the political organization of neighborhoods have increased the range and diversity of organizations operating in local politics. Fourth, council members are more diverse in their characteristics, more activist in their orientation, and less likely to accept the leadership of the mayor out of deference to the mayor's power or common party loyalty. All these changes in city politics make it more difficult for the mayor to lead effectively. The new openness of the local electoral process and the individualism of persons elected to office diffuse the concentration of power needed for governing the city.^[10]

The mayor's performance is also affected by individual characteristics—experience; personal or occupational financial and staff support; personal attributes, such as charisma, reputation, wisdom, and commitment to the job (time, resources, energy expended); and effectiveness in dealing with the media. These factors determine how well and how fully the mayor fills the position, and how creatively the mayor exploits both formal and informal resources. The charismatic or adroit weak mayor may be able to win substantial support from the community and wring more advantage from limited powers than others have done. Ferman argued that “effective political skills” are the critical factor for strong mayoral leadership.^[11]

Effective leadership by the mayor is critical in the mayor-council city. Without it, the offsetting powers of the mayor and council can produce policy stalemate and administrative departments can resist change. The performance of mayors can be judged by their effectiveness on two dimensions: initiating policies, and getting policies implemented. The various types of mayors can be classified using this approach. If the mayor is a *caretaker* with no goals, the city will drift and be reactive when problems occur. If the mayor is a *reformer* or policy initiator but poor at getting things done or a *broker* who can arrange compromise but has a weak policy agenda, city government will lack a key element of leadership. This form functions best when the mayor is an *innovator* who can help to provide a clear direction for city government and ensure that city departments are focused on accomplishing the goals of elected officials.

Non-Executive Mayors in Council-Manager Cities

The council-manager form is based on the unitary model of organizing government. The council ultimately possesses all governmental authority, and executive authority is assigned to the city manager. There is no separation of powers or checks and balances in the system, although the form provides for specialization of roles. The council and mayor occupy the overtly political roles in government, set policy, and select the city manager who is continuously accountable to the council. The manager provides policy advice and recommendations to the council, and directs the administrative apparatus. Within this broad division of functions, there is considerable sharing, which this form of government promotes. The city manager also provides policy leadership in helping to frame the agenda of concerns that the council considers, and has latitude in the way that policy goals are converted into programs and services. The council, in contrast, has the potential to oversee the administrative performance of the city through appraisal of how the manager is doing specifically (and whether the manager will continue in office) and its ability to secure information about the performance of administrative staff in general.

The mayor is typically the presiding officer of the council and has no formal powers different from those of other council members, except for the veto power in 13% of council-manager cities. Mayors, directly elected in 62% of these cities,^[12] can be an important source of policy guidance and coordination of participants, although they rarely exercise any administrative authority. Thus, mayors in council-manager cities are not executives. They have close interaction, however, with the appointed executive and potentially affect the city manager's performance and influence.^[13] It is useful, therefore, to examine the roles of this kind of mayor as an official who helps to bridge the relationship between the appointed executive and the council.

The ideal mayor in council-manager cities is a facilitator who promotes positive interaction and a high level of communication among officials in city government and with the public, and who also provides guidance in goal setting and policy making.^[14] This type of leadership is well suited to the conditions of the council-manager city in which cooperative relationships among officials are common and the city manager provides support to the elected officials to whom the manager is accountable. Effective leadership by this kind of mayor improves the working relationships among officials, makes the form of government function more smoothly, and increases the involvement of elected officials in setting policy.

Typically, the mayor in the council-manager city is formally the presiding officer and serves as ceremonial head of the government. In addition, mayors may provide coordination and communication that helps to link the representative leadership of the council and the executive leadership of the manager. Finally, mayors may provide policy leadership and guide the work of the council. These roles are mutually reinforcing and are filled concurrently.

Facilitative leadership does not depend on a superior power position. There are resources available in the council-manager form and within the incumbent as a person to develop leadership in the areas of coordination and policy guidance. The strategic location occupied by the mayor in the center of communication channels to the council, the city manager and staff, and the public provides the foundation for effective leadership. Mayors with a clear conception of the job who use personal resources skillfully are more likely to be able to take advantage of this resource.

There is variation in the nature and scope of leadership, depending on how well the roles that make up the office are filled. Those who do not fill even the traditional roles (e.g., being an ineffective presiding officer who allows the council to flounder in meetings) could be called a *caretaker*, whereas those who fill these roles well but attend to no other are *symbolic heads*. Both the *coordinator* and *director* create an atmosphere that promotes cohesion and communication among officials and strengthens the capacity of the council to identify problems and make decisions. The coordinators, however, are not strongly associated with a policy agenda of their own, even though they contribute to fashioning and acting on an agenda as part of the council. The directors are associated with a distinctive policy agenda, although this agenda incorporates to a greater or lesser extent the views of other officials. The coordinators are effective at developing a sense of cohesion and purpose in their cities and at strengthening the policy-making process. They are not themselves, however, active policy initiators. They are more process oriented than policy oriented. The director-type mayors create an agenda in the sense that they take the initiative to put it together and their own ideas are central to it. Other officials and the public recognize this contribution and view the director mayor as a policy initiator.

In sum, although these mayors lack formal powers over other officials, they occupy a strategic location in the communication channels with the council, the manager, and the public. The moderately effective mayor goes beyond ceremonial leadership to provide effective coordination and communication and, thus, affect how the manager as executive is connected and interacts with the city council. The director-type, highly effective mayor also helps to develop a common

set of goals with wide council support that provide a framework within which the manager as executive can operate.

CITY MANAGERS AND ADMINISTRATORS

The city manager is the executive officer with extensive authority for directing staff, formulating and (after approval by council) expending the budget, and controlling operations. The manager is appointed by the council without approval by voters and serves at the pleasure of the council without term. The manager is typically the only staff member hired by the council (in some cities, the city attorney and/or clerk are selected by the council as well); all other employees are hired under the authority of the manager. The norm of the system is for elected officials to respect the insulation of staff from "political" interference.

The structure of council-manager government promotes cooperative relationships among officials. Because the ultimate control over city government lies with the council, there is less likelihood of power struggles between the council and the manager. The council and the manager do not compete for the same "rewards" from public service. Elected officials seek public support and reelection, whereas managers are concerned about how the council assesses their work and their standing and respect in their profession in order to have the option for advancement by moving to another city. Furthermore, city managers have a professional commitment to helping the council accomplish its goals; if they do not, they can be replaced. To be sure, tensions can emerge among elected officials or between them and the staff. The important difference from mayor-council governments is that, with no separation of powers, officials do not have to deal with structural factors that lead to conflict, and positive relationships are common. The approach to leadership taken by the city manager in the council-manager form can be different than that of executive mayors operating in a separation-of-powers setting.

The city manager as executive in council-manager cities is extensively involved in the policy formation aspect of executive leadership and responsible for directing the administrative organization. They are also community leaders. To an extent not found at other levels or in other forms of government, city managers along with other local government-appointed executives, such as school superintendents and directors of public authorities, are both general policy leaders and organizational directors. City managers do not report to an elected executive or go through political appointees in developing policy recommendations for elected officials; they report on performance directly to the governing board. Because of their

close working association with the residents of the communities they serve, they have a special obligation to value community leadership, as well as to preserve and protect the democratic quality of the political process as a whole. Unlike the elected executive, city managers are accountable to the entire governing board and are expected to provide leadership from a professional perspective. This does not mean that the city manager is not involved in politics, but rather that this involvement should be guided by professional considerations and standards.

City managers are potentially involved in a wide range of activities. City managers have commonly been shown to be active contributors to policy formulation, and they are responsible for directing the administrative organization.^[15] In addition, they advise the elected officials on a range of topics. Analysis of the extent to which top administrators are policy innovators, advisers to elected officials, and administrators has revealed consistency and variation.^[16] Most city managers (85%) are active as policy innovators. One-half combine this role with emphasis on administrative functions, and one in eight combine it with high involvement in advising elected officials. Over 20% are highly active across the board. The minority (about one in six) who are not active in policy innovation are not very involved in the other roles either. Thus, appointed executives tend to be actively and more or less broadly engaged in the governmental process.

City council members generally give city managers high ratings on their performance. In the national survey of council members in cities over 25,000 in population mentioned earlier, over 80% of the respondents agreed that the council and city manager have a good working relationship and that the manager does a good or very good job of accomplishing the goals established by the council.^[17] Over 70% feel that the manager is doing at least a good job in providing the council with sufficient alternatives for making policy decisions and sufficient information to assess the effectiveness of programs and services. Furthermore, 83% gave a high rating to the manager for improving efficiency, and 87% gave this rating for maintaining high standards of personal conduct for self and for staff.

In over one-half of the mayor-council cities over 2500 in population, there is a CAO^b or city administrator. The scope of the position and the duties depend on what responsibilities are assigned in the charter or by the officials who appoint the CAO. These usually include authority over implementation of programs,

day-to-day administrative concerns, and budget formulation, as well as playing an advisory role in developing other policy recommendations. It has been common to assume that the CAO is appointed by the mayor, derives their influence from the mayor, and operates within the orbit of the mayor.^[18] In a 2001 survey, in cities with a population of 2500 or more, 44% of the CAOs are appointed by the mayor with the approval of the city council, and another 39% are chosen by the city council.^b In only 16% of the cities is the CAO appointed by the mayor alone, although direct mayoral appointment is found in approximately two-fifths of the cities over 100,000 in population. When appointed by the mayor, the CAO serves at their "pleasure" and turnover is high, especially when a new mayor comes into office. When appointed or approved by the council, the CAO is similar in characteristics to the city manager.

Chief administrative officers are also supposed to bring management expertise to city government and can manifest the same characteristics as city managers. In general, however, the CAO is more likely to be recruited from within the city in which they serve and selected by the mayor for reasons other than professional qualifications, although the CAO may have extensive training as well as experience.^[19] City managers are somewhat more likely to be "careerists" who have served in other cities and aspire to move to "better" positions elsewhere. In a 1997 survey of city administrators, approximately one-fourth of the top administrators in both major forms of government are recruited from within the city, although the percentage of CAOs recruited from the city in which they serve increases with greater city population. If recruited from another local government, city managers are more likely than city administrators to have served as the chief administrator or as the assistant manager (51% vs. 36%) in their previous post. However, 17% of CAOs come from the private sector compared with 8% of the city managers.^[20]

When appointed by the mayor, the CAO is the agent of the mayor and has power proportionate to their responsibility to the mayor. The CAO is valued as the mayor's most active troubleshooter. The scope of the position and the duties depend on what the mayor assigns. The CAO's status is ambiguous because mayors have difficulty giving the CAO sufficient power to bring professionalism to the administration of city government, and CAOs have difficulty winning the confidence of the mayor. Often, mayors and department heads bypass the CAO in their dealings with each other. Thus, the CAO's subordination to the mayor compromises their policy and executive leadership. However, when the CAO is appointed or approved by the council, which is more common in smaller cities, this official follows the lead

^bCalculations by authors of data from *Form of Government Survey 2001*; International City/County Management Association, Washington, DC.

of the entire council. These CAOs are similar to city managers in their values and orientation. Still, CAOs tend to stay in their position a shorter time than city managers. In the 1997 survey of city managers and CAOs, the average number of years in the current positions is 6.9 years for city managers and 6.5 years for CAOs. In cities over 50,000, the tenure drops to 6.4 for council-manager cities and 4.3 years for mayor-council cities. In comparison to managers, CAOs are not as upwardly or geographically mobile.

CONCLUSION

City managers are executives and city administrators are partial executives who bring a wide range of professional considerations to the discussion of city government policies and practices. By raising professional considerations in policy discussions, city managers help to ensure a balanced approach to policy decisions.^c By acting out of commitment to strategic goal setting, ethical standards, and sound management, city managers also promote proactive policy making, as well as fairness and efficiency in the delivery of services and the use of organizational resources. These contributions can be combined with those of the mayor as elected executive or the mayor as shaper of the context for the appointed administrator to create a blend of political and professional leadership in the executive functions in local government.

Federal Subsidies for New Entrepreneurial High-Growth Firms

Terry F. Buss

*Center for International Affairs, National Academy of Public Administration,
Washington, District of Columbia, U.S.A.*

INTRODUCTION

Only 3% to 5% of small firms account for three-fourths of jobs created in the United States.^[1] Not only do these high-growth firms create jobs, but they also are much less likely than other small businesses to fail; create considerably more wealth in the form of profits, sales, and value; pay higher wages and offer greater employee benefits; are much more likely to export products and services; and invest more in research and development (R&D). These firms also outperform the Fortune 500 companies.

Many observers believe that for every one that succeeds, many more potential and emerging high-growth firms that are worthy investment opportunities never start up or die prematurely because capital needs at earliest stages of development are unmet. For economists, capital gaps occur when worthy business opportunities go unfunded even though capital is available in the economy overall. Capital is unavailable, inaccessible, insufficient, costly, or in improper form (e.g., debt versus equity).

Believing that some potential and emerging high-growth firms worth investing in lack needed capital, some observers argue that federal action—potentially including tax incentives, subsidies, loans, equity, spending, regulation, and/or geographic reallocation—is necessary to address private capital market failure. Indeed, existing federal economic development programs are based on this market failure premise.

This article reviews empirical evidence on, and economic theory about, possible capital gaps affecting potential and emerging high-growth firms:

- During long-term, sustained growth in the 1990s, the preponderance of evidence suggests that capital gaps do not seriously affect high-growth firm formation and development.
- Some regions attract less outside capital or produce less capital from local investors because these regions

lack requisite industrial clustering and resource concentration, characteristic of regions infused with early stage investment, and produce fewer or much less attractive investment opportunities. This is not a capital gap because large numbers of worthy investment opportunities do not appear to be left unfunded.

- Some technology-based ventures—because of high R&D and startup costs, high risk, lengthy product development time, scarcity of information about potential markets, and lack of management experience on the startup team—may have difficulty accessing early stage capital. Financing these firms sometimes requires highly sophisticated, specialized, experienced, knowledgeable investors, typically venture capital fund managers, former executives in the industry, or corporations in the field.

WHAT IS A HIGH-GROWTH FIRM?

High-growth firms are those that experience rapid employment growth, usually at least 10% to 20% annually over a 5-year period. High-growth firms do not necessarily create or employ new technologies in starting up. Many well-known high-growth firms—Staples, Office Max, Office Depot, Walmart, Starbucks, Planet Hollywood, and even high-tech companies such as Amazon.com—do not use new technologies. Rather, they employ existing delivery systems in more efficient ways to meet consumer demand. High-growth companies do not need to be manufacturers. Neither are they exclusively high-technology or technology-based firms. Using Dun & Bradstreet national data for 1997, analysts discovered that all net growth in jobs derived from the service sector. In the economy as a whole, only 1 in 50 firms can be classified as high tech. High-growth firms are found in every industrial sector.

Potential high-growth firms are those in the idea, seed, or R&D stage of development. Emerging high-growth firms are those starting up or in early stages of development. Most analysts exclude firms created through mergers and acquisitions from discussions of potential or emerging high-growth firms. These activities combine workforces, rather than creating new jobs

An earlier version of this publication was presented to the U.S. Congress as a report from the Economics Division, Congressional Research Service, U.S. Library of Congress.

from scratch, and in any case, are not considered to be as early stage. Mergers and acquisitions are none the less important because they create increased funding for earliest stage firms. Large high-tech firms may reduce R&D investment, preferring to acquire it from fledgling firms, rather than develop it in-house.

Entrepreneurs, here, are people who start, or are in the process of starting, what they hope will be a high-growth firm, rather than a small business. Entrepreneurs use new methods in production or service delivery, or create new products, processes, or services. They are not small business operators.

HOW ARE HIGH-GROWTH FIRMS CAPITALIZED?

Capital flowing to high-growth firms is segmented into overlapping niches. Financing depends on levels of risk and expected return on investment, whether firms require equity or debt capital, and the role the startup entrepreneur(s) play in management.

Insider investors—the entrepreneur, friends, relatives, and acquaintances—typically are *the* major source of investment at seed, startup, and early stages. Entrepreneurs with capital are willing to take chances on their ideas; others close to them either have confidence in the entrepreneur's ability to pay them back or make their investment profitable, or are willing to gamble on the prospect. At these earliest stages, potential and emerging high-growth firms, generally require modest amounts of capital.

Angel investors are the second most important source of investment at earliest stages. Angel investors are wealthy individuals who invest in new ventures in exchange for equity. Their role in capital markets for some firms at least is best compared to baseball analogy. They function as a farm team—preparing firms for venture capital investment and eventual public ownership. Angels invest an average of \$60,000 to \$85,000 in a firm in exchange for equity. Angels often invest in consortia, averaging \$660,000 per firm. There may be as many as 250,000 angels, investing about \$10 billion in 30,000 firms annually, but estimates vary widely because there is no reliable way to count them.

High net worth individuals are generally much wealthier than angel investors and do not take an active role in growing businesses. They allow either venture capital firms or management to grow businesses. High net worth individuals may invest directly, usually from \$5 million to \$50 million, in private placements in ventures without venture capital intermediaries.

Venture capital flows to seed or startup stage ventures, but only in relatively modest amounts. Venture capital refers to capital invested through venture capital firms (actually managed funds) by large

institutional investors—pension funds, university endowments, or banks; corporations; or high net worth individuals. There is no comprehensive source of data on venture capital fund investments. Rather, individual brokerage houses and research firms track some funds but not others. There is also some overlap in tracking by different sources. Venture capital firms not only experience high returns on investment at later stages, but they also experience comparable, although lower, returns at earlier stages. Many venture capital firms generally balance out their portfolios with early- and later-stage investments. In recent years, some venture capital firms have even begun to specialize in early stages, investing as little as \$5000. Perceptions that venture capital does not flow to seed and R&D stage ventures are unfounded. At issue here is the amount of capital available from venture capitalists and number of ventures capitalized.

Initial public offerings (IPOs) generally do not capitalize potential or emerging high-growth firms. They usually capitalize young, but proven firms, trying to reach a new stage of accelerated growth for which large amounts of capital are required. The average IPO is about \$50 million.

Bank and finance company debt financing does not typically flow to early stage high-growth firms. Risks are too high, investment amounts are too small, and returns are too low. Researchers have recently observed that finance companies appear to be willing to take greater risks on startups than banks. Reasons for this have yet to be established. But even in those relatively rare cases when banks and finance companies do lend to earliest stage firms, capital may not be sufficient, sometimes causing firms to fail. Banks and finance companies do not lend at anywhere near the magnitude of angel or venture capital firms. As such, ventures requiring large amounts, but relying instead on commercial and industrial (C&I) loans, may find themselves undercapitalized and at risk of failure.

Even though commercial loans are rare for earliest stage ventures, entrepreneurs may use personal debt instruments to capitalize businesses indirectly. Second mortgages, home equity loans, borrowing against Keogh retirement accounts or insurance policies, and credit cards are commonly used. Entrepreneurs may also use consumer loans to purchase automobiles, computers, and homes for use in businesses. Entrepreneurs may have access to large amounts of capital not taken into account when only examining private equity or commercial loans.

There are three other sources of capital used by early stage firms: corporate venturing, strategic alliances, and trade credit. Corporate venturing occurs when a parent company spins off an independent firm, with the parent capitalizing the venture. Employees of the parent firm are paid or encouraged to create the

new venture. Strategic alliances are joint ventures or partnerships where one firm, having capital, partners with a startup to exploit a market, manufacture a product, or deliver a service. Strategic partners invest about \$250,000 on average. Trade credit is widely used, but not well documented for potential high-growth firms. Suppliers, distributors, or consumers offer credit, usually as extended payment terms, to new ventures to get them started.

Once firms emerge at early stage, later-stage venture capital, as well as bank and finance company loans, tend to become more readily available. Also at this stage, many firms receive financial help from trade credits. However, insider finance remains the major source of capital for the vast majority of firms. Entrepreneurs invest their own capital or retained earnings when they are able to make sales. In some cases, entrepreneurs may sell a prototype and use the income—retained earnings—to reinvest in a better model. Friends and relatives provide capital, as do angels.

An important point about financing early-stage high-growth firms is that some investors bring not only capital, but also expertise to ventures—they are value-added investors. Angels and venture capitalists typically have extensive experience in markets, industry, and management, allowing them to actively participate not only in capital formation, but also in firm development. Angels mostly invest in entrepreneurs with whom they are comfortable and concern themselves less with markets, whereas venture capital firms often control entrepreneurs and concern themselves more with markets. Having an equity position in the firm empowers them to participate in its management. In the case of angels, most invest in firms near their homes, facilitating their active participation in new ventures. Empirical research confirms importance of this guidance and expertise to entrepreneurs. Corporate spin-offs and strategic alliances also are value-added investments. Banks and finance companies, mutual funds, bond traders, stock brokers, and high net worth investors are only minimally value-added investors, relying on the track record of the firm established over time, disclosure required by regulatory agencies, and/or value of pledged collateral.

ARE THERE CAPITAL GAPS?

The preponderance of empirical research, analysis, and opinion in the 1990s suggests that overall, insider, informal, and formal capital markets function well. Surveys of entrepreneurs in businesses generally, and high-growth firms particularly, reveal that capital formation was not a problem. A review—based on surveys of entrepreneurs, business associations, and bankers, along with analyses of lending data—by the

Board of Governors of the Federal Reserve System of capital availability nationally concluded that capital formation was not a significant problem. Business magazines across the United States generally report that the economy is flooded with capital. Venture capital funds over the past few years have invested record amounts of capital in early stage, including seed and R&D, firms. Because some observers believe significant capital gaps exist, even in the face of the evidence above, it is useful to take a closer look at empirical research undergirding this conclusion.

There may be some confusion about problems entrepreneurs have in raising capital versus the lack of capital available for investment in worthy business opportunities. Entrepreneurs typically spend a great deal of time searching for and then obtaining capital. This poses a problem in that entrepreneurs do not obtain capital right off the bat. However, the grueling process of obtaining capital is necessary to help entrepreneurs test the viability of their ideas in the market. As they get turned down by investors, they learn more and more about their idea: that it likely will be commercially viable or not. This process protects entrepreneurs from wasting their own resources—time and money—and those of investors. A major function of capital markets, then, is not only to provide capital, but also to ferret out investments, worthy and unworthy. The tough process of capital formation is not a capital gap because it does not concern a shortage of capital for worthy ideas.

One reason capital formation may not be a problem at early stages is that, for most ventures, only small amounts of capital are required to develop an idea, start up, and begin production. One-half of *Inc.* magazine's top 500 fastest-growing new small businesses in America were seeded with less than \$50,000, one-fourth with less than \$5000. A Coopers & Lybrand study of fast-growing new firms found that median startup capital was \$82,300. Because the vast majority of high-growth firms do not need massive infusions of capital, issues of formal venture capital availability are important to a relatively small number of firms, a finding supported below.

Evidence concerning impact of earliest-stage venture capital on firm growth, rather than startup, appears mixed. One study found that entrepreneurs who were denied venture capital believed that their businesses grew more slowly as a result. Other studies show that firms with venture capital backing grew faster than those without it. However, surveys of entrepreneurs with venture capital backing report that although they had venture capital, it was not critical in helping their firms to grow. These survey results can be interpreted in several ways. It may be that venture capital fund managers are good at picking the most promising high-growth potential firms, with the result

that they grow faster than non-venture-backed firms, which may be less desirable choices. This is consistent with the fact that venture capital firms spend a great deal of resource evaluating prospective deals before they invest. Another explanation may be that venture capital is not so important to growth as the value-added investment and management control that—through equity—venture capitalists bring to emerging high-growth firms. Entrepreneurs in venture capital-backed firms clearly do not distinguish between the finance and knowledge that venture capitalists bring to new enterprises. Human capital may be more important than finance.

Empirical evidence cited above on startup capital and earliest-stage venture capital only concerns successful, proven firms. What can be said about firms that were intended to be high-growth ventures, but never started up because of insufficient capital? Virtually nothing can be said, at least directly. It is easy to identify entrepreneurs with ideas who failed early on for want of capital, but impossible to determine whether their ventures would have attained high growth or whether they would have been viable. If firms initially denied capital eventually start up and succeed, then one might argue that they are not victims of capital gaps by definition. Analysis here is concerned with entrepreneurs who never start.

One way of getting at the issue of unmet capital needs versus non-capital-related failure, at least indirectly, is to look at how existing high-growth firms are capitalized at earliest stages. Numerous studies show that the vast majority of entrepreneurs obtained insider or informal capital, and, to some extent, angel investment, but typically not venture capital funds or other forms of private equity. Because of their age and size, they also did not access public equity or debt. Therefore, if existing high-growth firms did not typically rely on sources other than insider and perhaps some angel capital, then it is unlikely that there is a large, unmet need for formal capital investment at earliest stages. Entrepreneurial failure to start up in most cases must relate to non-capital issues, such as poor business ideas or poor management skills or capacity.

It is also important to reemphasize that venture capital represents a small proportion of earliest-stage investment, compared with insider and angel capital. Yet, venture capital seems to receive much more attention than insider and angel capital investment. Venture capital investment has become highly visible in the press, whereas insider and angel finance remain a private activity. Shortage of venture capital and capital gaps are not equivalent issues.

Another line of argument in the literature is whether the very existence of federal and state venture capital programs suggests prevalence of capital gaps for potential or emerging high-growth firms. It is argued that entrepreneurs accessing these federal and state

programs have been turned down by private investors and have insufficient insider or informal capital to start up. This seems to show that successful businesses funded by publicly subsidized programs represent investment opportunities missed by private capital markets. The Small Business Administration's Small Business Investment Company (SBIC), for example, funded household names in the computer industry in their formative stages—Intel, Cray, and Apple. In short, existence of public programs reinforces the perception of capital gaps at earliest stages.

However, many economists offer other possible interpretations. Public programs do not generally capitalize businesses at seed or startup stages, and only a few address earliest stages.^a Audits by the Inspector General's Office, for example, showed that SBICs judiciously avoid earliest-stage financing even when subsidized to take on increased risk.^[2] In this respect,

^aConsider three very different federal programs as examples. SBICs are widely replicated in OECD countries and represent the largest venture capital program in the United States (see Ref.^[2]). Ostensibly, the program's intent is to encourage investments in pioneer firms, not just traditional ventures, in filling capital gaps left by private capital markets. Yet, in a report on SBIC best practices by SBA's Office of the Inspector General, the OIG found that the most successful—that is, profitable, and not at risk of failure—SBICs invested in later stage companies, especially leveraged buyouts, and avoided seed or start-ups altogether. Further, successful SBICs only invested in firms with an established market niche. Investments made in early-stage companies with speculative markets had relatively low success rates. Therefore, even though SBICs, as financial intermediaries, are backed by government guarantees to encourage debt and equity investment in riskier ventures, SBIC managers still tend to make investment decisions as do private venture capitalists. When they act differently, they risk going out of business, even with government backing.

In the high-tech field consider the federal Advanced Technology Program (ATP) (see Ref.^[3]). Advanced Technology Program provides funding, matched by private investment to companies or firms in consortia of universities, businesses, and government laboratories for the development of generic technologies with broad application. Advanced Technology Program funds high-risk development *past the basic research stage*, but not yet ready for commercialization. In addition, ATP also specifies as a qualification: the past performance of the company or joint venture members in carrying out similar kinds of efforts successfully, including technology applications (consideration of this factor in the case of a startup company or new joint venture takes into account the past performance of key people in carrying out similar kinds of efforts). Only 37% of awardees of ATP grants were small businesses (see Ref.^[4]). A study by GAO found that public funding crowded out private investment in R&D, contrary to the legislative intent of the program (see Ref.^[5]). See also Refs.^[6] and ^[7] for positive and negative assessments of federal technology-based programs for high-growth firms.

The SBA 7(a) loan guarantee program. 7(a) is a loan guarantee program for institutional lenders extending credit to new (no older than 6 months) and existing small businesses, which were turned down for credit using normal business channels (see Ref.^[8]). Earliest stage ventures are clearly not represented in the 7(a) program. Only about one-fourth of 7(a) loans even go to new businesses. There is no requirement that borrowers have high-growth potential ventures or innovative products, technologies, or processes.

publicly subsidized programs are like formal capital markets. Most important, economists argue that many publicly subsidized firms could have accessed private capital (even though they were turned down by private investors or lenders), but were attracted to lower capital costs afforded by public programs.^b In its study of Advanced Technology Program, for example, the General Accounting Office (GAO) found that this federal program was for many firms the first choice of funding, rather than an alternative source once having been turned down by private capital.^[8] To the extent that this is so, publicly subsidized capital programs displace or crowd out private funds that would have been invested were it not for subsidies.^[10]

Although federal programs do not appear to reach earliest stage high-growth ventures, they do, however, reach ventures pursuing earliest stage technologies, processes, or products. This distinction is often overlooked or ignored in evaluating federal program outcomes.

Researchers also find that many state-funded venture capital programs across the United States have been unsuccessful, and many are being defunded.^[11] State-funded programs rarely submit to independent evaluation, but studies generally find job creation claims to be overblown. Many claim greatest success in job retention, raising the question of whether programs are subsidizing jobs that would have been maintained without public funding or keeping alive firms that ought to die or shrink. State venture capital programs, presumably tailored to needs of local business, likely would be more in demand were capital gaps really so prevalent for high-growth firms.^c Some analysts conclude that state venture capital programs exist mostly in response to other states: existence of a program in one state is perceived as a competitive disadvantage by adjacent states, so they too adopt one.^[13] This draws into question whether capital market failure exists. So these programs are created not so much to stimulate new development as they are to channel firms that would have started up anyway into selected locations.

The argument that federal and state programs may not be addressing real capital gaps is supported by empirical research suggesting that venture capital firms, angels, and banks have excess capital to lend, but are not offered viable investment opportunities. Venture capitalists, for example, only fund 3% to 5% of the 200 to 500 (in some cases more) finance proposals most receive annually; this after they spend a great deal of time evaluating the entrepreneur's capacity to grow a company and market opportunity. Economists refer to this as preinvestment due diligence. Venture

capital firms often retain consultants and experts to evaluate products. It is not unusual for a venture capital firm to pay consultants to take a product apart to see how it was made and whether it can be mass produced for profit. Of the 3% to 5% pursued, most will not pan out. Venture capital fund returns, including the more than \$1 billion annually invested in earliest stage firms, are three times higher than publicly traded stock on average, but venture capital returns have three times the standard deviation above or below the average than the average for publicly traded stock. The implication: some venture capitalists receive high returns on investments, whereas many others fail miserably. Venture capitalists also refer viable projects to other venture capital firms when they are unable to fund them, and in numerous cases, venture capitalists counsel entrepreneurs in how to make their business plans marketable. Many venture capital firms, not interested in an idea themselves, will help an entrepreneur to prepare a business plan for another venture capital firm's consideration, sometimes in exchange for equity. Venture capital firm practices suggest that entrepreneurial proposals receive wide consideration in the market.

The notion that good ideas are not plentiful is borne out in studies about why venture capitalists and angels, for that matter, reject investment proposals from would-be high-growth entrepreneurs. The two major reasons for rejection are 1) there is no demonstrated market for the product, and 2) the entrepreneur has insufficient management capacity to grow the firm. A common problem in potential and emerging high-growth, technology-based firms is that they were started by scientists or technicians who lack management, marketing, and entrepreneurial skills.

A final line of argument concerns study methodology. Most researchers examine whether capital formation was a problem for entrepreneurs starting high-growth firms. Study results mostly show that for entrepreneurs capital formation is difficult, and rightly so, as observed above. However, studies fail to ask whether the entrepreneur merely desired more capital or really needed it, and whether the entrepreneur eventually raised money in another way or found ways around the difficulty. When these additional factors are explored, capital gaps among entrepreneurs seem to be more perceptual than real.

In sum, empirical evidence suggests that capital gaps for potential and emerging high-growth firms are not a significant problem in today's economy, at least not significant enough to warrant federal intervention.

ARE THERE REGIONAL DISPARITIES?

Empirical studies suggesting regional capital gaps abound. Regions, states, and rural economies differ

^bResearch on this point is legion (see Refs.^[6,9]).

^cSome analysts take a more positive view of state-funded venture capital programs. See for example, Ref.^[12].

markedly in amount of capital available locally or attracted from outside for investment in earliest-stage potential high-growth firms. Regions differ with respect to rates of startup, employment generation, and industrial sectoral growth. Research focuses either on venture capital investment or prevalence of high net worth individuals, likely because both are easier to track. Angel investment, because it is not publicly monitored or regulated, is virtually impossible to track. Studies look at the amount of venture capital attracted to high-growth regions per firm or per capita, and compare this with the region in question. The difference between what a region has now and could have if it performed like a high-growth counterpart is regarded as the capital gap. Studies of high net worth individuals and angels examine census data showing number of individuals with high incomes in the region and investments made. These are then compared with other regions to discern capital gaps.

Many regional studies finding capital gaps conclude that regions either have local investors—venture capitalists, angels, or high net worth individuals—who are not interested in local investment, or they have insufficient numbers of local investors. In the former, capital flows out of the region and is not replaced by sufficient inflows, in the latter there is a shortage of capital. The same studies tend to rely on studies reviewed in the previous section to support the notion that worthy opportunities for investment are plentiful, but are not capitalized.

Regional studies are problematic because they rely on research and inferences about the prevalence of unfunded worthy investment opportunities seemingly suffering from the same problems already presented in the preceding sections. If the analysis above holds, then it is not likely that there are large numbers of worthy unfunded investments in most regions. Analysts, then, may be misperceiving or overestimating potential high-growth firm opportunities available for investment.

Critics question whether methodologies employed in such regional research actually reveal capital gaps on the investment side. Criticism differs for venture capital, angels, and high net worth investors.

Venture Capital

Concerning venture capitalists, venture capital is attracted to a region from investors across the United States and internationally because ventures in the region present the best investment alternatives—highest return adjusted for risk. Risk is assessed on information that venture capitalists hold about entrepreneurs and that markets entrepreneurs propose to exploit. Venture capitalists have expertise in

industries in which they invest and in the markets these industries serve, and are adroit at evaluating entrepreneur capacity to grow a company. Successful initial venture capital investments attract subsequent investment to a region, a kind of herd effect. What undercapitalized regions lack, then, is not only the best investment opportunities compared with others, but also agglomeration of ventures working in similar industrial sectors, professionals with expertise in these industries—bankers, lawyers, marketing professionals, technicians, scientists, and engineers—educational facilities, especially universities producing research and graduates for industry, and so on. It is unlikely that venture capitalists will extensively invest in regions without this supportive infrastructure.

Consider Route 128 in Boston. This corridor is or was home to hundreds of high-tech companies with household names, Digital Equipment, Lotus Development, Wang, and Data General. It is served by dozens of venture capital funds and some of the largest emerging growth company funds, such as that offered by Fidelity Investments. It boasts of MIT and Harvard, not to mention Brandies, Tufts, Boston University, and Boston College, whose professors, scientists, and students spawn hordes of new high-tech, high-growth companies annually. In addition, there are countless consulting firms and businesses supporting these ventures. Such clustering in turn attracts entrepreneurs and high-tech workers. Only a handful of regions in the United States can boast of this concentration of resources in high-tech. This leads some critics to argue that in addition to lacking viable business ideas, capital does not flow to some regions to potential high-growth firms because they lack the supportive infrastructure, not just money.

Angel Investors

However, not all investment is made by venture capital funds, angels play a substantial role. Concerning angel investors, critics argue that angels, like venture capitalists, are also knowledgeable investors, having experience in industries in which they invest and living near their workplaces so that they can take an active role in operating a company. Angels know about markets, but their main focus for investment is their potential relationship with entrepreneurs. Also, the literature suggests that many angels invest not only to profit, but also as a kind of recreation. In short, they receive both monetary and psychological rewards from investment. If local opportunities for investment do not include both dimensions, then angels may not be interested. Capital gaps can only exist if potential angels elect not to invest in local opportunities that are at least as profitable as others. Because angels usually

invest close to home and take part in businesses, it is unlikely that other regions would attract them as investors who will take an active role in companies. Some studies tend to look at people with the same income or worth as angels as potential investors. But wealth alone is not an indicator of the capacity of individuals to make investments in risky ventures. Again, it is not capital that is at issue, it is expertise and participation that separate angels from comparably wealthy people.

High Net Worth Investors

Critics argue that high net worth investors, like venture capitalists, invest in opportunities representing the best investment adjusted for risk. Capital, then, flows across the United States. Unlike venture capitalists and angels, high net worth investors do not tend to take an active role in assessing investments or operating companies. More important, they invest millions at a time and are generally not interested in directly investing small amounts of capital in emerging businesses. They tend to leave oversight and due diligence to intermediaries—either venture capital fund managers or brokerage firms. So research looking at prevalence of high wealth individuals, critics argue, is misdirected because their money is intermediated by investment firms. Investment firms, then, are the issue, not the wealthy. So, it does not matter whether high net worth investors are themselves present or absent from a region.

Other evaluations suggest that some regional studies may be measuring perceptions of capital gaps that cannot be supported. In a survey of economic development practitioners in Alabama, Maine, Minnesota, and Washington, for example, the GAO found that 66% and 77%, respectively, believed that credit and equity gaps existed to a great or very great extent, for startup businesses, but somewhat less for expanding businesses at 26% and 33%, respectively.^[14] However, when GAO asked practitioners to provide empirical evidence to support their conclusions, none was forthcoming.

In evaluating the regional capital gap literature, it is important to consider evaluations of public programs. One critical study examined firm performance data for participants in the federal Small Business Innovation Research (SBIR) program,^d comparing them with a control group of firms not participating in the

program.^[18] Overall, SBIR participants outperformed non-participants in sales and employment growth. At first blush, it appears that capital gaps were closed by publicly subsidized programs. However, SBIR participants, located in areas with low concentrations of private venture capital and sparse industrial clustering, had less in sales and employment growth compared with SBIR participants in regions with concentrations of venture capital and industry clustering. It might also be the case that SBIR investors do a better job of picking winners in supportive economies than in less supportive economies. Yet, this exception might prove the rule: perhaps SBIR investors in less supportive economies find it difficult to adequately evaluate merging high-growth firms because of the lack of supportive infrastructure.^[17] This also tends to confirm the impression that factors other than capital availability influence business location.

One thing on which nearly all analysts agree is that rural areas have sufficient access to capital generally, but are underserved by equity investors, angels, or venture capital. There are insufficient numbers of entrepreneurs to attract outside investors and relatively few local investors. Consequently, investment opportunities in rural areas are somewhat less likely to come to fruition locally. The perception is that entrepreneurs who take their ideas to cities, where capital is more readily available, face high transaction costs—costs of finding investors or lenders—and high rejection rates because they are not known to investors or lenders.

The rural capital gap for equity investment may be overstated. A study of all Initial Public Offerings (IPOs) from 1970 to 1995, broken down by urban and rural areas showed that 10% of IPOs—measured in amounts invested and numbers of firms—were for rural firms.^[19] In addition, more than one-half of rural IPOs were backed by venture capital, while less than one-half of urban firms had this backing. Rural IPOs performed as well as urban ones, as measured by stock price and return on investment. Venture capital and IPO investment does flow to many rural areas. How can this be reconciled with the fact that rural areas lack investors locally, industrial concentrations, and supportive infrastructure? The answer is that entrepreneurs actually do find investors and support in regional financial centers—Minneapolis, Denver, Houston, and the like—contrary to perceptions. Capital markets function well for emerging high-growth firms as long as they are near urban centers, which most appear to be.^e This research also tends to call into

^dFor an overview of this program, see Refs.^[15,16] The SBIR Program's intent is to stimulate technological innovation, use small businesses to meet federal R&D needs, foster participation by minorities and disadvantaged people, and increase commercialization of innovations. Research on the program finds that it, like ATP discussed above, also crowds out private funding using public subsidies. In addition, the fact that firms tend to receive repeat awards draws into question whether SBIR is reaching startup entrepreneurs. See especially, Ref.^[17].

^eThere are about 2000 rural counties in the United States. The lion's share of these are federal conservation lands, and sparsely populated and remote farming, ranching, and mining regions. Much of the rural population lives in counties adjacent to metropolitan areas. See Ref.^[20].

question prevalence of barriers in linking investors and entrepreneurs in rural areas rather than capital gaps.

ARE THERE TECHNOLOGY-BASED SECTOR DISPARITIES?

Empirical studies on capital gaps for emerging high-growth firms have not definitively resolved the issue of capital availability for technology-based companies, but there is evidence that is suggestive, either from limited empirical investigations, or more often from anecdotal evidence and case studies. In exhaustive, independent reviews of research and venture capital programs in western, industrialized countries by the Bank of England and Organization for Economic Cooperation and Development (OECD)^[21,22]—along with extensive Congressional testimony,^f reports from the 1995 *White House Conference on Small Business*, and others^[24,25]—most observers concluded that technology-based, high-technology, and biotechnology-based (hereafter, referred to as technology-based firms) potential and emerging high-growth firms, although they pass through the same growth stages as other ventures, have more specialized capital formation needs and are more likely to experience capital gaps. Like other firms, technology-based firms depend heavily on insider capital in earliest stages. Exceptions, of course, are spin-offs from existing corporations. But capital needs of technology-based firms tend to be much higher than other businesses starting up. Technology-based companies often require access to expensive equipment and materials during seed and R&D earliest stages. Entrepreneurs in these companies may take years to develop and test a product to see if it even works. Once it works, then more time is required to determine whether it can be manufactured at a reasonable profit. Large amounts of capital over the long-term, required at seed or R&D stages by some ventures, are sometimes not available from insider and informal sources. Angels and venture capitalists—having large amounts of capital, invested at high risk, over an extended period—may be the only source of finance for some ventures. Angels and venture capitalists often invest in rounds—first, second, and third—as entrepreneurs increasingly demonstrate the viability of their ideas. Because this process can take years before investors profit, angel and venture capital is often called “patient capital.” Once they mature, technology-based companies begin to resemble other businesses in their capital needs.

A peculiarity of technology-based firms is that they tend to be started by technicians—engineers,

programmers, or scientists—who have a single product to market, have little or no management experience, and may lack capacity to grow a company. Having a single product or application makes it difficult for investors because all the ventures eggs are in one basket. Most emerging high-growth firms are single-product dominated or use a single application. Dell Computers, for example, the best performing high-tech stock of the 1990s found a competitive advantage in the computer industry: selling directly to customers while avoiding a middleman. Dell Computers did not innovate new technologies across several product lines. This greatly increases investment risk, turning away potential investors. Technicians, having little management experience, further increase risks, if they try to grow the business themselves without seeking professional help. Because technicians may be reluctant to give up firm management, they greatly reduce the pool of investors likely to be interested in their venture.

Even though angels and venture capitalists may be the investors of last resort for technology-based firms, entrepreneurs may not have access to these investors. Angels and venture capitalists tend to specialize in certain technologies where they have expertise. Some good investments may not be of interest to all potential investors. Angels and venture capitalists, with expertise in certain technologies, may not have time to evaluate or participate in the opportunity. Entrepreneurs and investors may be unable to find one another to close a deal. Or, angel and venture capitalists, having to work closely with entrepreneurs they fund, may not like their prospective business partners so they reject a deal.

Although capital formation for technology-based ventures may be subject to the influences above, research that moves beyond this to identify what kinds of firms experience capital gaps, why difficulties occur, and to what extent there are problems is lacking, and ought to be a priority for future study. As it stands now, the doubtful existence of capital gaps generally still seems to apply in the high-tech area.

CONCLUSION

Because most new jobs are created by a small number of emerging high-growth small companies, some observers are calling for government intervention in capital markets to reduce capital gaps, causing emerging high-growth firms to grow too slowly and potential high-growth firms from failing early on.

Empirical evidence suggests that capital markets, including formal and informal investors, work well, and that overall capital gaps are not problematic for potential and emerging high-growth firms. Capital gaps might emerge in the future during severe economic downturns, as they have in the past.

^fSee, for example, Ref.^[23].

Evidence about capital gaps for regions and technology-based firms, is not conclusive. Some regions have greater concentrations of capital for potential and emerging high-growth firms than others, but this may have more to do with the prevalence and quality of investment opportunities and the requisite industrial clustering and financial infrastructure that stimulates and sustains investment, than with capital unavailability. Some technology-based firms appear to experience capital gaps, because of the peculiarities of how these firms typically grow and are financed, but there is little evidence to support or refute the notion that there is a widespread capital gap problem for large numbers of high-tech firms.

It appears that the case for federal intervention to correct capital market failure for emerging and potential high-growth firms has not been made.

Federalism in “Homeland Security” and Crisis Management

Alethia H. Cook

David J. Louscher

Department of Political Science, University of Akron, Akron, Ohio, U.S.A.

INTRODUCTION

Responding to a domestic act of terrorism in the United States will be a major challenge for coordinated federal, state, and local response. The word “will” in the preceding sentence was used intentionally instead of “would.” There is general agreement among federal, state, and local governments, as well as the defense community, that the terrorist threat is a question of when, not if, a strike will occur. The Oklahoma City bombing and the World Trade Center bombing brought this harsh reality to the forefront for many in government and academia who were studying terrorism. The rest of the country was made painfully aware of the threat on 11 September 2001 when terrorists hijacked four planes and flew them into the World Trade Center towers, the Pentagon, and a field in Pennsylvania. In spite of these many warnings, the nation is woefully unprepared to meet this critical challenge, particularly if the terrorist act is something other than a conventional explosive.

The concept of federalism, so important in the American political system, itself will be one of the critical challenges. Local authorities who are witnessing the devastation wrought by an act of terrorism in their own backyards will understandably be reluctant to turn over responsibilities for dealing with the crisis to state and federal level entities. Federal organizations are interested in protecting evidence and the crime scene in the interest of catching the perpetrator, as well as assisting the local government with recovering from the event. These potentially conflicting goals may create tensions between the different government agencies at different levels. Response to an intentional biological contamination may be even more complex than for a chemical or conventional strike.

While the nation has been making efforts to improve preparedness, two distinct problems remain that threaten to undermine effective response. The first is that the majority of the effort to improve readiness has been made at the federal level. This is problematic as the response to terrorism, whether it is chemical, biological, nuclear, radiological, or conventional, is necessarily a local event. The police, firemen, emergency management services (EMS), hospital personnel,

and other first responders that will be tasked with dealing with the impact of such an event are the ones that need the resources to improve preparation. The second major problem with preparedness is that most of the preparation efforts have focused on either a chemical, nuclear, or conventional attack. Although these threats are important, they are not the only ones faced. Because the nature of the events are so different, increasing preparedness for chemical response will not help deal with a biological attack. The impact of federalism on these two challenges to preparedness, public administration, and effective response are the focus of this article.

FEDERAL PREPARATION FOR A LOCAL CRISIS

There is no question that the United States has been working to improve its response capabilities. In particular in the aftermath of September 11, extensive efforts to better train, equip, organize, and manage response have been a focus of government. What is in question, however, is whether the resources that are being expended are being used in an efficient and effective manner. As demonstrated on Fig. 1, there is a lot of funding being spent at the federal level, with little money reaching the first responder. There is no centralized coordination for the expenditure of this money or for training and preparation.^[1] This is problematic as there are over 40 government agencies playing an active role in homeland defense.^[2] According to Warren Rudman, “[t]he United States stands in dire need of stronger organizational mechanisms for homeland security. It needs to clarify accountability, responsibility, and authority among the departments and agencies with a role to play in this increasingly critical area.”^[3]

One of the major efforts undertaken by the federal government has been the establishment of 27 National Guard Weapons of Mass Destruction Civil Support Teams. These teams are trained and equipped by the federal government, but will be deployed under the control of governors in the state where the event has occurred. They train regularly and have access

Fig. 1 Breakdown of the federal budget to combat terrorism, 2000. (Adapted from Ref.^[5].)

to state-of-the-art communications equipment.^[4] Although the National Guard teams are a valuable asset, an argument can be made that the funding could have been spent to equip first responders rather than a federal level team that will take time to deploy. According to one critic, “2333 hospitals or fire stations could be out fitted with decontamination capabilities for the cost of standing up one National Guard Civil Support team. If the total 1999 budget for these National Guard teams had been used thusly, 49,800 local facilities could have been armed for decontamination.”^[5]

This situation places the burden on local responders to determine where the federal resources are and how they can get them quickly in case of an emergency. Without this kind of arrangement in place, it does not matter how much the federal government spends on preparedness. If the local-level entities cannot rapidly get equipment, vaccines, and other resources, the terrorist strike will have a much more devastating impact on the local community.

Federal organizations are engaged in outreach activities aimed at informing local responders about the resources available to them and providing training. This task is more complex than it would seem. The event itself will dictate who the responsible local authorities will be. As a result, the federal organizations need to get their information out to all local fire, police, health, and infrastructure officials that may be relevant to a terrorist strike. Because of this complexity, major cities have received the majority of contact with and training from the federal government, leaving smaller communities seriously unprepared.^[6]

An additional problem with this federal training is that once the exercise is over, there is no follow-on training or regular practice of the techniques for effective response. Furthermore, there are no standardized ways of assessing the quality of response.^[5] The implications of these problems are significant. It is unreasonable to expect first responders to learn more

effective response if they are trained only once, are not given adequate feedback on their performance, and do not have the opportunity to learn from their mistakes.

Local authorities clearly need to be better trained to identify and respond to a terrorist event when one occurs. The implications of this federalism problem are significant. Money, training, and cooperation have to be spread among the levels of government if the United States hopes to mount a successful response. The problems of coordinating the levels of government will fall within the tasking of the new Department of Homeland Security. It will be responsible for making the country more prepared to respond to catastrophic terrorism. One of its major challenges will be to find a more effective pattern of funding, training, and organization to overcome the paradox of federal level preparations for local level events. Although there is a definite response role for the federal government, it will not be first on the scene of a terrorist strike, nor is it likely to be the most important element of any response. A careful reassessment of the nation's response spending priorities should be undertaken to correct these problems and put resources in the hands of those tasked with first response. However, before that can be done, government must gain a better understanding of the complexity of response.

FAILURE TO PREPARE FOR BIOLOGICAL EVENTS

As mentioned above, different types of threats confronting the United States require distinctly different types of response. In the event of a chemical or conventional attack, there is an identifiable moment that the attack occurs. If a bomb goes off, responders know when it went off, they mobilize their resources to mount an effective response, arrive on the scene, struggle to mitigate the impact of the attack, and then turn

the victims over to the medical community. The majority of the efforts underway to improve preparedness have focused on this kind of event.^[7]

However, a biological attack will present itself very differently. This was demonstrated in the Anthrax attacks in 2001, when those exposed to the agent became ill over an extended period of time. Biological agents can take anywhere from 2 to 14 days to incubate and become symptomatic. Victims who are exposed to the agent may circulate among the general population during this time without being aware that they have been infected. Depending on the type of agent and the way it is transmitted, those who have been exposed may be spreading the disease within the community. To detect this kind of event, the public health system will have to recognize that an epidemic is underway. The faster the agent used is identified, the lower will be the casualty rate from the event. Each day that the event goes unreported is another day that the victims are infecting others. The problem is exacerbated by the fact that the public health providers must be able to identify the difference between a naturally occurring event and one that is intentional.

Effective response to a biological event, therefore, requires that local-level health providers be aware of the symptoms of the major potential biological warfare agents so that they can identify these diseases quickly (Table 1). They must also understand the ways in which a naturally occurring event is likely to differ from a terrorist strike. Finally, health care providers must be ready and able to report suspicious diseases to a system that can help to identify infection patterns. Although cases of a disease may cluster in a small community if the agent was distributed locally, it may be that the agent is distributed in a way that will initially manifest as a few cases that are widely spread.

Some analysts believe that the government is over-reacting to the threat of biological terrorism. They

argue that biological agents are difficult to grow in quantities necessary to disseminate them widely and that effective delivery of the agent is incredibly difficult.^[8] The anthrax attacks seem to support this argument as the agent was deployed in an inefficient manner and caused relatively limited casualties. However, fanatical terrorists may allow themselves to be infected with an agent, become contagious, and board an international flight; infecting the other passengers on each leg of the flight and effectively spreading the disease around the world.^[7]

This is where the concept of federalism will complicate response. Although diseases will initially be reported the local level, with patients going to their doctors or to an emergency room, identifying the extent of the terrorist act may rely on a national or even international coordination of medical information. The Centers for Disease Control and Prevention (CDC) in the United States issues guidelines to American hospitals for those diseases they must report so that outbreaks can be identified. However, many biological agents have flu-like symptoms and it may not immediately be clear to physicians that they are dealing with something other than the common flu. Furthermore, a widespread epidemic may be difficult to identify as patients arrive at different hospitals but no real trend seems to be present until much later. Every day the spread of the disease goes unrecognized, the potential impact of the event increases exponentially. Communication about disease diagnoses is key.

This poses a significant problem for many local health systems that are consistently underfunded. A survey revealed that many local systems do not have access to e-mail and the Internet, and may even still have rotary phones.^[7] They are not networked in any meaningful way aside from their communications with the CDC. As such, the CDC may be the first to pick up on a local epidemic because hospitals may not be

Table 1 Critical biological agents

First-tier agents	Second-tier agents	Third-tier agents
Anthrax	Brucellosis	Hantaviruses
Botulism	Cholera	Multidrug-resistant tuberculosis
Ebola	<i>E. coli</i>	Nipah virus
Junin (Argentine hemorrhagic fever)	Epsilon toxin	Tickborne hemorrhagic fever
Lassa fever	Equine encephalomyelitis	Tickborne encephalitis viruses
Marburg	Glanders	Yellow fever
Plague	Ricin	
Smallpox	Salmonella	
Tularemia	Shingella	

Note: First-tier agents are easy to employ, spread easily, and have high mortality rates; second-tier agents are moderately easy to employ and have low mortality; and third-tier agents are available, easy to produce and disseminate, and the potential for high mortality.

Source: Adapted from Ref.^[8].

able to effectively communicate about their patients' symptoms. These problems exist in spite of significant efforts on the part of the Department of Health and Human Services and the CDC to help local entities build their response capacities.^[5]

Another major problem that will be confronted by public health care officials is the panic that will likely occur among the local population. Again, a biological event will be different from a chemical or conventional attack. If someone bombs a building or releases a chemical agent in a subway, citizens who were not in those areas can be relatively certain that they were not affected. If a disease begins to spread, people will begin to worry that they have been exposed. Mass numbers of generally healthy individuals, or people with flu-like symptoms, may converge on hospitals and doctors' offices seeking medical attention. The Anthrax attacks provided evidence of this problem, with mailrooms closed around the country and sales of Cipro (the antibiotic for treating Anthrax) being sold on the internet to people who had been nowhere near the known cases of exposure. In any biological attack, local-level officials will need help in containing the panic and dealing with the influx of patients. Communication will also be important in this effort. Notifying the public about the threat, the way in which the disease is transmitted, the symptoms of the illness, and where to seek treatment will be critical to controlling the public's reaction. Calming public fears will be a serious challenge facing local authorities. This is an issue rarely covered by training exercises that are focused on chemical or conventional terrorism.

These problems generated by the federal nature of the American system must be overcome in order to have more effective response capabilities. Policy makers need to rethink the focus of national efforts to increase preparedness so that resources can be expended in ways that assist first responders in

performing their roles. More attention needs to be paid to the unique nature of biological terrorism or a major epidemic so that those kinds of problems can be detected and contained as quickly as possible. Without these changes in U.S. policy, a major terrorist strike will have an unacceptably large impact on the society and may undermine public faith in government.

Feminism and Chaos Theory

Mary Ann McClure

*Department of Art, Music and Philosophy, John Jay College of Criminal Justice,
New York, New York, U.S.A.*

INTRODUCTION

Contemporary chaos theory explains phenomena traditional science cannot and reveals hidden order in the apparent random behavior of, among other things, business cycles, epidemics, and insect populations. It also provides a vision of nature that challenges the notion of nature central to traditional science. In its concept of nature and methodology, chaos theory parallels the efforts of contemporary feminists to reshape traditional understanding of scientific inquiry. Both feminist philosophers of science and chaos theory presume a methodology that attends to difference, is non-reductionistic, attributes agency to nature, and conceives of inquiry as fallible.

Traditional science makes a claim to being objective. The scientist who pursues objectivity seeks a context-free knowledge that aspires to be omniscient, fully formalizable, and unbiased and disinterested. What connects these characteristics is the key concept of detachment. Objectivity as detachment means the separation of the knowing subject from the object of knowledge. Objectivity depends upon clear and distinct boundaries between the self and the world. Thus, in the act of trying to gain objective knowledge, the scientific mind separates itself from nature.

THE FEMINIST CRITIQUE OF TRADITIONAL SCIENCE

Feminist epistemologists have examined the concept of scientific objectivity in terms of its claim to value-neutrality and in its association with masculinity, where the “masculine” denotes a cognitive style rather than a biological category. They have traced the historical origins of the concept of objectivity to the emergence of the Newtonian paradigm in the sixteenth and seventeenth centuries, when the new science of that day demanded new concepts of nature and inquiry. Newtonian science was struggling against the older medieval view that held nature to be an alive organism and part of God’s domain. Seeking a new concept of nature, modern science reconceptualized nature as dead and thus passive and inert—like a machine—in a fixed and determinate universe.

Feminist philosophers of science have argued that this conceptual framework of modern science is fundamentally gendered. Attributes such as objectivity, detachment, and abstract thinking that are attributed to science are also stereotypically masculine. The achievement of scientific knowledge, identified as a specifically male way of knowing, demands not only the separation from, but the domination and control of nature and of female human nature in particular. Thus, the feminist project becomes one of rethinking the concept of objectivity and, once again, reimagining our concept of nature.

SCIENCE AS FALLIBLE

If traditional objectivity claims omniscience, feminist philosophers of science, such as Sandra Harding, advocate a “stronger” sense of objectivity in which knowledge is understood to be fallible.^[1] Evelyn Fox Keller and Donna Haraway seek alternative framings of biological and physical theories in which scientific knowledge is modeled on a dialogue that remains open-ended and does not seek closure. For Keller and Haraway, rational knowledge is less a set of facts or theories than a process. This notion of scientific inquiry as a process places emphasis upon on the act of revision, in which we encounter the limits of our control of the natural world. To understand is not merely to know a set of facts about nature but to possess the skill of being open to the experience of limitations.

The move from scientific inquiry having the potential for omniscience to its being understood as inherently limited and fallible is best captured by Keller’s distinction between order and law in nature. A law-like nature fits the demand of traditional objectivity which calls for a total correspondence between theory and reality. Nature that is law-like can be captured best by the language of science—mathematics. In contrast, when Keller understood nature as being orderly, she conceived of the order in nature as being more complex than any law that the human understanding will ever invent. Theory can never provide a complete representation of reality, because nature will always remain more abundant than our representations. Nature is characterized by an a priori complexity that will inevitably confound the capacity of the human inquirer.^[2]

Similarly, chaos theory seeks to find patterns and connections, while jettisoning the requirement that the patterns must be ruled by law-like necessity. Researchers, fascinated by the development of chaotic motion, look for regularities, using computer graphics to identify and explore ordered patterns that would otherwise be buried in reams of computer output. But, there is a difference between searching for patterns and searching for laws. These researchers studying chaotic motion realize that the patterns they discern will not have a unique evolution or act predictably.

Traditional science has been based upon the power to predict and control, but chaos theory asserts that when systems become chaotic, science no longer has this ability. The defining characteristic of chaos theory is a sensitivity to initial conditions, such that for chaotic systems, we will never be able to measure the initial conditions accurately enough to get an accurate prediction. It is inherently impossible, because if the initial configuration of a chaotic system is changed even slightly, its future behavior is altered radically.

It is far better to consider chaos theory as a search for order, a concept broader—as Keller pointed out—than the concept of law. The determinate randomness of chaotic systems can be better understood as conforming to a sense of order rather than law, because we are studying behavior that has intrinsic causes, that is, it is orderly, but remains irregular and unpredictable. Thus, chaos theory by challenging the notion of scientific omniscience validates the insight of feminist epistemologists that scientific knowledge is inherently fallible.

NATURE AS AGENT

The Newtonian vision of the world as a clockwork mechanism implies that physical matter is inert and dead. Feminist epistemologists argue that this metaphor of the world as a machine has functioned as a justification for power over and domination of nature. To move beyond a notion of knowledge as power and of power as domination, feminist philosophers of science have attempted to restore agency to nature. Thus, it becomes important for Keller that nature not be bound by the necessity of law but be understood as generative and resourceful. She argues that Noble Laureate Barbara McClintock's work on genetic transportation was possible because McClintock had a belief in the resourcefulness of the natural order. Her discovery of the capacity of organisms to reprogram their own DNA points to the existence of forms of order more inventive than those we had previously envisioned.^[3]

Haraway also suggests that we grant the status of agent to the objects in the world. She speaks of the world as having a sense of humor and as resisting being

reduced to mere resource. To express a concept of nature that eludes being completely captured by the human imagination, she appropriates the metaphor of the coyote trickster of Native American legend. We keep pursuing the wily coyote all the time, knowing that it will inevitably get the better of us.^[4]

Chaos theory also finds nature to be generative and resourceful. If the Newtonian paradigm reduced nature's complexity and simplified it into predictable, law-like behavior, chaos would allow for an understanding of nature rich in disorder and surprise. Even though a chaotic system is deterministic, we cannot predict what it is going to do next; this indeterminacy can make for resourcefulness. For example, the chaotic path of a prey in flight can be used to evade a predator.

ATTENDING TO DIFFERENCE

The model of scientific law in the Newtonian paradigm is based on a universalism in which difference disappears. In contrast, feminist epistemology advocates a methodology that is sensitive to difference and that makes difference intelligible rather than making it disappear as a mere anomaly to a general rule. Keller notes that for McClintock, the discovery of anomalous kernels of corn pointed, not to disorder or unlawfulness, but to a larger system of order that is not reducible to a single law. Similarly, Haraway's concept of "situated knowledges" reflects a commitment to pluralism and difference. Knowledge that is situated demands the participation of as many perspectives as possible and recognizes that the answers that come out of a plurality of perspectives can never be reduced to unity.

In the same manner, chaos theory by designating disorder to be complex information makes difference meaningful. Researchers in human physiology are now looking to the chaotic dynamics of the body to better diagnose and predict illness. Epileptic seizures and heart attacks were once understood to be rhythmic disorders in contrast to healthy, ordered rhythms. Now physiologists believe that chaos provides a healthy flexibility to the heart and brain. And in fact, healthy systems are characterized by innate variability, while impaired systems are marked by a transition to more ordered, less complicated states. Investigators are beginning to think that, contrary to accepted belief, healthy bodies do not seek homeostasis but rather that chaos is the natural way to put together the systems of the body.^[5]

Researchers are learning, therefore, that a lot of useful information can be attained by attending to the variability of a system as well as to its stable order. Chaos theory by alerting scientists to attend to difference validates the feminist insistence that

difference matters and that discoveries come out of a plurality of perspectives that can never be reduced to a unity.

NON-REDUCTIONISM

The method of the Newtonian model is reductionistic. To understand how a clock works, you break it down into its parts, study each element individually, and reassemble it to understand the whole. Study of the individual unit is more important than the study of constituent interactions. Keller argued that scientific techniques contribute to and are product of the ideology of a culture. She analyzed how the reductionist model when applied to biology reinforces values stereotypically associated with masculinity: individuality, autonomy, competition, and dominance. Both population genetics and mathematical ecology, for example, give precedence to competition over cooperative interactions. Genes are understood to be inherently selfish. And when the existence of cooperative behavior is acknowledged, it is reidentified as "cooperative competition."^[6] In genetics, DNA is understood to be a "master" molecule that encodes and transmits all instructions for cellular development.

Chaos theory helps undermine the methodology of reductionism. It privileges qualification over quantification and recursive symmetries over individual units. In the Newtonian paradigm, a scientific theory without quantification was not a theory, but for dynamic systems, quantification is frequently not possible.

Instead, qualitative understanding is achieved by studying what the whole looks like as it moves through changes by watching the activity of a strange attractor. To study turbulence or a fractal, it is necessary to assume that the part is the whole rather than to make the reductionist assumption that the whole is the sum of its parts.

To conclude, chaos theory has opened up a space within scientific inquiry for a notion of knowledge that is fallible, for a restoration of agency to nature, and for a methodology that attends to difference and that moves beyond reductionism. And in so doing, chaos theory represents the revisioning of nature and scientific inquiry sought by feminist epistemologists.

Feminist Comparative Policy

Amy G. Mazur

*Department of Political Science, Washington State University,
Pullman, Washington, U.S.A.*

INTRODUCTION

It has been over thirty years since the second-wave women's movements took to the streets to change society in western democracies. In part, as a response to women's movement demands, governments across the ideological spectrum have developed a complex and varied set of machineries and policies. These policies and agencies are specifically charged with promoting women's rights and status and, in some cases, with addressing the deep-rooted causes of gender-based inequalities between men and women. Like the women's movements that inspired them, they have had varying levels of success in achieving ambitious goals. Moreover, government policies and structures that promote women's status and rights, as well as gender equality, have the potential to better represent women as a group, both substantively and descriptively, and in doing so, to make democracies more democratic.

BACKGROUND INFORMATION

Since the late 1980s, a new area of study has taken shape within the purview of political science to study, assess, and develop empirically based theory about the impact, both direct and indirect, of these gender-based political dynamics between women's movements and the state. This field is distinct from non-feminist work in political science and policy studies that has tended to ignore gender-specific dynamics and is also distinct from work in feminist studies that takes a critical view of social science inquiry and state action. Filling in the gaps of and building from scholarship in Comparative Politics and Policy, as well as Gender and Politics, Feminist Comparative Policy (FCP) focuses specifically on feminist policy dynamics through a distinct approach and research community. FCP scholars seek to answer the highly complex questions of if, how, and why contemporary, Western, post-industrial democracies are feminist. FCP focuses on Western, post-industrial democracies and not on any countries outside of the West, given that the women's movement and its state responses in these countries share basic, common patterns that are a product of the particular level of economic, political, and social development found in the 23 countries in this category.

An ever-growing community of over one hundred researchers in Europe, North America, Australia, and New Zealand, share a common comparative approach to the study of gender, policy, and the state. By 2006, FCP scholars produced a significant body of literature deserving attention and created permanent research and teaching infrastructures on three continents. The goal of this article is to map out this relatively new area of study. It first examines the approach and core concepts of FCP and then turns to a discussion of the people, infrastructure, and some of the more prominent projects in the discipline.

Given the centrality of the term feminist for FCP, it is important to provide a working definition of this oft-contested concept. Feminism is defined here using the approach of recent FCP work that recognizes the core ideas of western feminism from which academics, activists, and policy practitioners choose. These ideas include: (1) a certain understanding of women as a group within the context of the social, economic, and cultural diversity of women; (2) the advancement of women's rights, status, or condition as a group in both the public and private spheres; and (3) the reduction or elimination of gender-based hierarchy or patriarchy that underpins basic inequalities between men and women in the public and private spheres.

APPROACH AND CORE CONCEPTS

Feminist policy scholars in Western Europe first acknowledged the empirical gaps and gender biases in theory and methodology used in the study of the state and public policy in the early 1980s. By the early 1990s, researchers in North America and Australia joined their Western European counterparts in the new feminist academic enterprise that sought to systematically study the interface between gender and the state. In the mid 1990s, a loose consensus formed in this transnational community around conventions for conducting research, developing theory, and reporting findings, moving the field into a new stage of vitality and institutionalization. In 2006, with (1) over 400 published pieces, over one-fourth of which were published in the past five years, (2) an estimated 20 million euros received in research funding since the mid 1980s,

and (3) four journals that serve as major outlets for FCP work—*Social Politics*, *International Journal of Feminist Politics*, *Politics and Gender*, and *Women and Politics*—FCP scholars and their work constitute a formidable presence in political science and public policy studies.^[1] The FCP approach includes the following six features.

Feature 1: An Applied Feminist Empirical Approach

Labels commonly used to identify different strands of Western feminist thought are not useful in identifying the feminist approach of FCP, e.g., liberal, radical, or socialist. Individuals who contribute to this new field mostly carry-out a feminist agenda through designing, conducting, and disseminating their research and teaching about the topics they study. Some FCP scholars participate in women's movements and organizations and serve periodically as experts on government women's eliminate commissions. Most researchers, however, pursue their political action in academia. Unlike many feminist scholars who seek to transform or revolutionize the study of politics, FCP scholars have a more moderate agenda aimed at working within the rules of the scientific arena and contributing to nonfeminist and feminist bodies of knowledge. They tend to eschew a separatist approach to research; most would agree that men and women should conduct feminist research.

Reflecting what Sandra Harding refers to as an “empirical feminist” approach, FCP scholars agree that past social science research was androcentric, dominated by men, with research problems and methodology excluding the considerations of gender and women.^[2] At the same time, they do not seek to dismiss the entire social scientific process. FCP scholars recognize that social science inquiry is not entirely value-free. In their view, social scientists that claimed to be conducting objective science in the past essentially ignored empirical gender policy issues in the formulation of research problems and designs.

Most FCP practitioners use empirical observation to test and explore hypotheses in order to contribute to theories about gender, politics, and the state. FCP studies are often designed so that findings can be used to help policy practitioners and activists in women's policy agencies, political parties, movements, and organizations learn more about the causes of gender-based inequities and the complex range of solutions, including different ways of designing good practices. Since the early 1980s, FCP scholars have been consulted regularly in their expert capacity by the European Union (in the context of the Action Plans on gender equality), the Council of Europe, the Nordic Council,

and the United Nations, as well as numerous country-based commissions at national and sub-national levels.

The applied feminist empirical approach underpins FCP scholar attitudes about identifying with specific feminist currents of thought and about adhering to a single fixed definition of what constitutes feminist policy, feminist states, and feminist political action in general. FCP scholars tend to avoid articulating a specific political stance on feminism in their research and teaching. They do not deny adhering to a certain type of feminist politics; they just do not apply their specific political views of feminism to their research. The definitions of feminism that FCP researchers use in their analyses, therefore, come from comparative studies of feminist politics, rather than their own feminist politics. FCP scholars tend to be leery of pinning down a single narrow definition of feminism connected to a specific current of Western political thought. In recent years, many agree that there is a growing consensus around broad definitions of feminism, like the one proposed above, that take into consideration the diversity of feminist ideas in Western countries and extend across national boundaries.

Feature 2: Operationalizing Normative Feminist Theory on Democracy

Normative political theory has been an integral part of the development of feminist studies in general. A major question asked by the extensive literature on feminist theory is whether Western democracies are as democratic as observers think, particularly given the degree to which women and women's issues have been excluded from politics, particularly in the context of the formal articulation of universal, gender-blind values of equality, freedom, and representation.^[3] Feminist theorists who write on democracy argue for a better inclusion of women and ideas that favor women's rights in the political process through “descriptive” and “substantive” representation.^[4] These themes of representation and democracy are at the center of FCP studies in so far as they ask the empirical question of whether, how, and why democratic states can be feminist. The question is less about the specific form and design of democracy than its capacity to incorporate women's interests and women themselves into the political process and, in doing so, to promote gender equality and a more complete democratic system.

Feature 3: Bringing the Patriarchal State Back in as a Research Question

As most political scientists agree, particularly since the state was “brought back in” in the 1980s, the concept

of the state—government structures as opposed to country—is not a simple idea. For many feminist theorists, the state is highly problematic, given that it is a product of systems of power based on male domination, or patriarchy. From the assumption of the patriarchal nature of the state, where state actions, structures, and actors seek to perpetuate systems of gender domination that keep women in their inferior positions in the public and private spheres, many feminist analysts dismiss or are highly critical of the state as an arena for positive social change. Other feminist theorists provide a more malleable view of state patriarchy and argue that certain state arenas may be appropriate sites for feminist action. FCP analysts do not entirely dismiss the possibility of a patriarchal state; they see the issue of state patriarchy as a question for empirical research. Some parts of the state may be patriarchal, while other parts may have the potential to be quite woman-friendly. FCP places the state and its institutions at its analytical core. The four major areas of FCP research, outlined in the next section, focus on some aspect of the state or state action.

Feature 4: Using Gender as a Category of Analysis

Since the mid 1980s, feminist research across different disciplines has shifted its focus from sex, a more-or-less dichotomous variable based on biological differences between men and women, to gender, the social construction of sexual difference between men and women. As Joan Scott first asserted in 1986, the relational concept of gender should be the prime “category of analysis” in theoretical frameworks and research designs.^[5] This holistic approach to the use of gender is intended to push analyses beyond an “add women and stir” phase where sex or women are added as an analytical afterthought. Since the mid-1990s, FCP scholars have incorporated gender into their research designs in a variety of ways.

Feature 5: Comparative Theory-Building in Western Post-Industrial Democracies

FCP scholars seek to develop theory through culturally sensitive, comparative, and cross-national analysis. They often employ principles of research design and methods developed outside of a feminist perspective. Up until 2000, with a few exceptions, FCP work utilized small *n* analysis—case studies and the comparative method. In recent years, many studies include a large number of observations and, hence, use the statistical tools of large *n* analysis. Other studies take a bridging approach, incorporating both qualitative and quantitative analysis. FCP studies take a *most similar*

systems approach, where economic and political development in Western, post-industrial democracies are the control variables and variations in nation-based culture, state-society relations, women’s movement mobilization, and government design are examined as they influence gender, state, and policy issues. Most FCP work assumes that post-industrial countries in the West, unlike other countries of the world, share certain environments and institutions, with notable cross-national variations. A part of the common heritage is that women’s movements have developed strategies aimed, at least in part, at influencing the democratic policy process and the development of large welfare states. Designing and using concepts like feminism that are able, as Giovanni Sartori first elaborated, to “travel” across national boundaries without “stretching” the core meaning are also a key part of the comparative agenda of FCP.^[6]

Feature 6: One-Way Intersections with Nonfeminist Political Science

Many FCP scholars since the mid-1990s have actively sought to intersect their work with nonfeminist literature. Instead of completely rejecting traditional political studies or uncritically using feminist studies, FCP work purposefully develops the strengths and shores up the weaknesses of each to advance knowledge in both areas. In general, efforts to intersect work with nonfeminist political science tend to be one-way. FCP scholars seek to contribute to nonfeminist work, and nonfeminist policy analysts ignore FCP theory building that speaks directly to central analytical issues. Even within the context of the increasing methodological pluralism of Political Science, few studies outside of the purview of feminist analysis use the findings or concepts of FCP research or even focus specifically on gender policy dynamics. This trend may be reversing, with the growing academic influence and reputation of FCP scholars and their work.

FCP IN ACTION: RESEARCH COMMUNITY, INFRASTRUCTURE, AND PROJECTS

The vast and growing FCP literature examines four different substantive areas with regards to the state and its institutions. *Feminist Policy Formation* work scrutinizes the ways in which public policy promotes women’s status and strikes down gender hierarchies through studying the obstacles, actors, content, and processes of policy as purposefully feminist. *Feminist Movements and Policy* research is concerned with the interplay between women’s movements, the state, and policy. A major issue of interest here is to evaluate

the success of women's movements in influencing the content of public policy and the structures of the state. *State Feminism* scholarship considers whether state structures and actors can promote feminism through focusing on: (1) women's actors in the state as policy-makers; (2) the gendered nature of state agencies that influence women's (and men's) roles; and (3) the activities of women's and gender-equality policy machineries and the bureaucrats, or femocrats, that staff them, in a wide variety of government agencies and branches. State feminism work assesses the links between the substantive representation of women's interests in policy and the state and the presence of women in elected office or descriptive representation. *Gender and Welfare State* literature examines the welfare state as a prime obstacle and promoter of both gender discrimination and equality. Much of this scholarship looks at the link between women's and men's roles in the public and private domain in relation to the policies of the welfare state.

In 2006, there are roughly one hundred scholars who work regularly on FCP research. To be counted as a part of the FCP community, individuals need to have two or more publications on an FCP topic. The list of active FCP scholars used for this analysis is available on request.

Most members of the FCP scientific community are women. More than a result of any collective decision to exclude men, their absence is a result of the realities of graduate education; women tend to be more interested in the study of feminist politics, and male students tend to be channeled away from what is often perceived as a less prestigious area of study. Less than one-fourth of FCP scholars are from the United States and nearly three-fourths are from Europe. One-half of FCP scholars is based in English-speaking countries—Ireland, the United Kingdom, Canada, Australia, and the United States. The other one-half is based in continental Europe—the Netherlands, Germany, Austria, Italy, Spain, Denmark, Norway, Sweden, Finland, France, Belgium, and Greece. Controlling for national population and size of university infrastructure, the FCP community is quite evenly spread among the different countries. Many FCP researchers are trained in one country and then work and live in another.

FCP practitioners began to develop research networks in the early 1980s. These networks often meet at the conferences of the European Consortium of Political Research, the American Political Science Association, the International Political Science Association, or the International Studies Association. At least ten FCP books have come out of ECPR workshops. In the 1990s, FCP scholars increasingly developed multinational research projects. Once in place, the network members secure funds from a combination of supranational, national, university, private funding agency,

and other institutionalized venues that are not overtly feminist. These projects implement a complex, long-term, gendered research program, produce a series of publications, and often create more permanent infrastructure, such as newsletters, journals, Web sites, graduate funding, and permanent teaching programs.

A selection of FCP projects is presented here. Several research networks have been active since the mid-1990s in the area of state feminism. A three-person British research effort on gender and urban government, entitled *Gender and the New Urban Governance*, received funding from the U.K. Economic and Social Research Council and was based at the London School of Economics.^[7] The Andrew and Rodgers edited book, *Women and the Canadian State*, originated in a conference sponsored by the SSHRC, the Department of Justice, the Department of the Secretary of State, and the University of Ottawa.^[8] It assesses the impact of twenty years of state feminism in Canada. A partnership between nationally based feminist researchers and the European Union, through the Community Action Programs on Equal Opportunities for Women and Men, has been an important catalyst in the development of a consolidated FCP community.

An update of a ground-breaking study of gender, policy, and state in Nordic countries was published in English, as well as in all of the Scandinavian languages, in 1999.^[9,10] This study cuts across all four areas of FCP research. The Gender, Empowerment, and Politics project in Denmark is also conducting research that addresses the analytical issues from the FCP paradigm. Highlighting the important role of Norwegian scholars in the FCP community, the Institute for Women's Studies and Gender Research at the University of Oslo created an e-mail list to report on women's studies-related networking throughout the world. A new Centre for the Advancement of Women in Politics at Queens University of Belfast promotes research and teaching on FCP-related topics as well (<http://www.qub.ac.uk/cawp/>).

The Women and Restructuring Network in Canada, funded by a Social Sciences and Humanities Research Council grant (SSHRC) and a grant from the Canadian International Development Agency, examines how state restructuring has affected women and women's movements in the context of the global economy. At least three publications have been inspired by this network.^[11–13] The project entitled *Public Policy Discourses, Mass Attitudes and the Governance of Gender Equality in Europe*, at the University of Brèmen, funded by the German government, is a seven-nation study on the institutionalization of gender equality norms in European Union member states from 1975 to 2000.^[14] The long-term study of the impact of European Union gender mainstreaming on policy debates and public discourse, MAGEEQ, in

six European countries, has received over 5 million Euros in funding from the European Union (<http://www.mageeq.net/>). A trans-Atlantic effort comparing women's movements and state dynamics in North America and Europe recently published its findings in *Women's Movements Racing the Reconfigure State*.^[15]

Founded in 1995, the Research Network on Gender, Politics, and the State (RNGS) is composed of 40 members. RNGS designed and is currently completing a large-scale comparative research project that examines if, how, and why women's policy offices, through their relations with women's movements, make post-industrial democracies more democratic and the state more feminist. In order to examine both substantive and descriptive representation of women, the research explores changes in the policy making process, through the gendering of policy debate frames, brought about by the interface between women's movements and women's policy machinery from the late 1960s to 2002. Fifteen teams in fourteen countries—the United States, Canada, Italy, the United Kingdom, Ireland, Germany, the Netherlands, Spain, Austria, Belgium, Sweden, France, Finland, and Australia—have been collecting data for this project since 1997.

The interface between agency and movement is explored in individual policy debates on five key issues: job training, abortion, prostitution, political representation, and a top-priority issue of choice specific to each country in the study. Data for 140 policy debates will be gathered by the project's completion. Results have or will be published in five edited volumes, one for each issue area,^[16–20] an article that analyzes the findings quantitatively across all five issue areas, and a capstone book that brings together the qualitative and quantitative strands. The qualitative findings of the five issue areas are in currently being transposed into a data set that can be used by researchers and policy makers.^[21] The dataset will be available for public use in 2007 and will be archived at the major social science data archives in the countries of the study, as well as on the network's website, <http://libarts.wsu.edu/polisci/rngs>. RNGS has received over one-half of a million dollars in grants to fund research and network costs from the French Ministry of Social Affairs, the National Science Foundation (United States), the British Economic and Social Science Research Council, the Canadian National Research Council, the European Science Foundation, and members' home institutions.

CONCLUSIONS

To be sure, FCP research is in a period of vitality and growth. With an empirical feminist approach, FCP

scholars are increasingly contributing to the study of policy and politics in Western, post-industrial democracies. It is increasingly difficult to conduct a study of state-based politics without mentioning gender-specific elements. So, FCP researchers are making non-feminist theories more complete and sound. At the same time, it is of fundamental importance that scholars who do not share the FCP agenda take account of FCP work. It is still quite common to find policy studies and textbooks on adjacent topics that completely ignore, or only marginally discuss, gender considerations. More than any systematic resistance to feminist policy work, we are often all too busy to learn about new areas. Thus, this article provides a go-to source for busy policy scholars unaware of this new field. FCP scholars throughout the world are reaching out to policy makers and activists, beyond the halls of academia. Through their work on government reports, expert consultations, and as members of state-based commission, practitioners of FCP, arguably more than many fields of study, have the potential to contribute to making our democracies more democratic.

Financial Condition

Jane Beckett-Camarata

Department of Political Science, Kent State University, Kent, Ohio, U.S.A.

INTRODUCTION

The regular reoccurrence of state and local governments' fiscal problems over the last 30 years has pointed to the need for an effective system to provide citizens, creditors, managers, legislative and oversight bodies, and others with early warning signs of pending fiscal stress. The widespread financial problems that occurred in the 1970s in cities throughout the United States resulted in changes in financial reporting nationwide. Pressure from the credit market and effective leadership of financial organizations have had major impacts, leading to improvements in financial reporting standards as well as compliance with those standards. Because of the implementation of those standards, potential fiscal problems are likely to be discovered sooner and prevented.

Thus, preventing financial problems requires early alert analysis to proactively identify trends and practices that may adversely impact financial condition. Assuring that government has the financial capacity to sustain desired public services is the primary reason for internal managers to monitor financial condition. Bond investors and creditors also have a similar interest in evaluating financial condition, particularly to assess a government's ability to make future interest and principal payments, even in the face of adverse economic trends or natural disasters. Knowledge that internal managers are employing a system to track financial trends provides investors and creditors with added confidence in the quality of the government's financial management. This is true particularly if such trend data are shared with credit analysts. Credit analysts also have more than a passing interest in the government's ability to provide services and pay down debt in the long run. Experience has shown that, in times of fiscal crisis, expenditures for critical services often take precedence over debt service payments.

Local governments produce many financial reports, both internal and external, every year. Financial data are presented in accordance with state and/or professional oversight bodies' requirements. Some states impose uniform financial accounting and reporting systems that all municipalities within the state must follow. Local governments may also be required to submit annual financial reports to a state oversight

body. State legislatures are responsible for helping formulate sound fiscal policies for the government. However, oversight bodies are responsible for establishing and possibly monitoring fiscal policies of governmental units they are responsible for. Both legislative and oversight groups are responsible for monitoring executive compliance with relevant laws and regulations.

OVERVIEW

The Comprehensive Annual Financial Report (CAFR) includes useful information for financial condition analysis. The essential information is contained in the basic financial statements (BFS), including the notes that are part of them. The BFS are financial statements that must be included in a government annual report to comply with GAAP under the Governmental Accounting Standards Board (GASB) statement no. 34. The required statements are: a government-wide statement of net assets; a government-wide statement of activities; fund financial statements for governmental, proprietary, and fiduciary funds; and Notes to the Financial Statements. The notes are particularly important for determining the structure of the organization, accounting methods used, assumptions made, and other background information that gives the reader a perspective as the financial statements are reviewed. Careful review and analysis of management's discussion and analysis (MD&A) and other required supplemental information (RSI) are fundamental to the new process. Furthermore, financial condition analysis must also take into account additional factors such as debt per capita, tax rates, and citizen income and wealth. However, financial condition analysis can be very complex. Prior to GASB statement no. 34, ratio analysis was limited. However, with government-wide financial statements prepared on a full accrual basis, it will be somewhat easier to use ratios to analyze governments' financial condition. Government financial statements usually do not provide information for more than 1 year, probably because of the amount of information already being displayed on one page. MD&A provides 2 years' worth of data for some numbers. CAFRs

frequently provide 2 years of statements. In performing a financial condition analysis, an understanding of financial trends is critical and, generally, 3 years' worth of data is considered adequate for ratio analysis.

What is the utility of the CAFR, given the complex analytical framework for analyzing financial condition? Many people who analyze public financial data find the introductory and statistical sections and the Notes to the Financial Statements to be more useful than the financial statements for assessing financial condition. This is because the introductory and statistical sections of the CAFR and Notes to the Financial Statements provide critical information on environmental and organizational factors and their relationship to financial factors. The BFS provide helpful information for calculating financial ratios essential to understanding the organization's financial position, which is an important component of financial condition.

WHAT IS FINANCIAL CONDITION?

Basically, financial condition is a local government's ability to finance its services on a continuing basis. It is the ability to: 1) maintain existing service levels; 2) endure local and regional economic disruptions; and 3) meet the demands of natural growth, decline, and change.^[1] The International City/County Management Association (ICMA) defines financial condition as "a government's ability to generate enough cash over thirty to sixty days to pay its bills."^[1] This definition of financial condition is called *cash solvency*. The Governmental Accounting Standards Board defines financial condition as: "The probability that a government will meet both its financial obligations to creditors, consumers, employees, taxpayers, suppliers, constituents, and others as they become due and its service obligations to constituents, both currently and in the future."^[2] In both the ICMA and GASB definitions, financial condition is similar to the accounting term *solvency*. Whether a local government can maintain existing service levels or increasing service levels is related to the concept of *interperiod equity*. Interperiod equity is defined as: "whether current-year revenues are sufficient to pay for the services provided that year and whether future taxpayers will be required to assume burdens to pay for current services to future taxpayers may threaten the government's ability to sustain the current level of services or to expand services to meet future population growth."^[3] Financial condition can also apply to a government's ability to provide services at the level and quality that are required for the health, safety, and welfare of the community and that its citizens desire. This is its *service-level solvency*. A government that does not have

service-level solvency might, in all other respects, be in sound financial condition, but be unable to support police and fire services at an adequate level. If in such condition, the local government tries to provide adequate services; it suffers cash, budgetary, or *long-term solvency* problems.

FACTORS AND INDICATORS USED IN ASSESSING FINANCIAL CONDITION

Financial condition analysis is the examination of the financial status of a government organization based on a financial statement analysis as well as an evaluation of many external factors that affect the financial condition of the government, such as the wealth of the citizenry, employment rate, and general economy. Financial condition analysis is a complex, multidimensional concept that requires the study of a multitude of factors. GASB identifies the major categories of these factors as: economy and demographics; revenue base; current and capital expenditures; debt, pensions, and other postemployment benefits; internal resources; management capabilities; infrastructure; and willingness to raise revenues and provide required public services.^[2] Khan,^[4] in his study of municipal bond ratings, listed several indicators used for assessing and making comparisons of financial condition. These include Per Capita Income, Percent Below the Poverty Line, Age of Housing, and Unemployment Rates. Economy and demography are two of the categories used by ratings agencies to assign bond ratings to municipalities. The ICMA uses indicators such as Vacancy Rates, Property Value, Population, Business Activity, Poverty, Households, Personal Income Per Capita, and Employment Base in its handbook for analyzing financial condition. It identifies these categories as "Community Needs and Resources Indicators." ICMA's financial trend monitoring system was developed for financial managers to use in tracking their governments' financial performance. The ICMA points out that these factors are important because they indicate the interrelationship between community demands for services and the ability of the government to provide them.

"Changes in community needs and resources are interrelated in a continuous cumulative cycle of cause and effect. For example, a decrease in population or jobs lowers the demand for housing and causes a corresponding decline in the market value of housing; this, in turn, reduces property tax revenues. The initial population decline also has a negative effect on retail sales and personal income, causing local government revenues to drop even further. But because of fixed costs in its expenditure structure that are impervious

to declines in population or business activity, the government cannot always balance the revenue loss with a proportionate reduction in expenditures. The government may, in fact, be forced to raise taxes to make up for lost revenues: this puts a greater burden on the remaining population. As economic conditions decline and taxes rise, the community becomes a less attractive place to live and population may decline further. The cycle continues.’’^[5]

WHAT IS THE DIFFERENCE BETWEEN FINANCIAL CONDITION ANALYSIS AND FINANCIAL POSITION ANALYSIS?

The primary difference between financial condition analysis and financial position analysis is that financial position “tends to be a shorter-run concept compared with financial condition.”^[2] According to GASB, “financial position for governmental funds focuses on assets and liabilities that require cash, or are normally converted to cash in the near future and can generally be determined from the financial statements alone.”^[2] Thus financial position is associated with the concept of liquidity.

Internal and external analysts can compare specific ratios to national and state medians published by Moody’s Investors Service, Selected Indicators of Municipal Performance (Moody’s annual), or comparative ratios published by Dr. Kenneth Brown for both cities and counties. Dr. Brown’s Ten-Point Test^[7] can be used to compare the financial position of cities or counties. The Ten-Point Test consists of a comparison of 10 key ratios for a city, county, or school district with similar entities across the nation. The *Test* measures the following elements of financial condition.

- Revenues—the ability of annual revenues to finance government services
- Expenditures—the manner in which revenues are utilized to provide government services
- Operating Position—the extent to which a positive balance between revenues and expenditures exists and the level of sufficiency of liquid assets and reserves
- Debt Structure—the levels of debt, both short term and long term, and the burden of annual principal and interest payments.

Of the 10 key ratios, three measure the adequacy of revenues, one measures expenditure allocation, three measure operating position liquidity, and three measure the debt structure of the entity.

DR. BROWN’S TEN-POINT TEST OF FINANCIAL CONDITION

1. Total Revenues/Population
2. Total General Fund Revenues from Own Sources/Total General Fund Revenues
3. General Fund Sources from Other Funds/Total General Fund Sources
4. Operating Expenditures/Total Expenditures
5. Total Revenues/Total Expenditures
6. Unreserved General Fund Balance/Total General Fund Revenues
7. Total General Fund Cash and Investments/Total General Fund Liabilities
8. Total General Fund Liabilities/Total General Fund Revenues
9. Direct Long-Term Debt/Population
10. Debt Service/Total Revenues.

The analysis in [Table 1](#) uses data from the four similar Ohio cities to compare financial position.

CITY OF CANTON, OH

The City of Canton is the county seat of Stark County in northeastern Ohio. It was incorporated as a village in 1828 and became a city in 1854. The 1998 U.S. Census Bureau estimate of population for the City of Canton was 79,259, a decline of 5.8% from the 1990 census figure of 84,161. Canton is a statutory city under the laws and regulations set forth in the Ohio Constitution. It operates under the mayor–council form of government. The main source of revenue for the operations of the city government is the collection of a 2% income tax. The city provides police protection, firefighting and prevention, street maintenance and repairs, building inspection, parks and recreation, water, and sewer and sanitation.

The results of the ratio analysis for Canton show relative strength in ratios 1, 5, and 10. Ratio 1, Total Revenue/Population, shows Canton to be in the upper quarter of cities. Higher per capita revenues indicate that the city has adequate annual resources to meet its obligations. Ratio 5, Total Revenues/Total Expenditures, is a measure of operating position and measures relative levels of operating surpluses or deficits. Canton’s high score indicated that in FY 1998, it ran a relatively high operating surplus, which helps to build margins for the future. Building margins in good times helps soften the blow of bad times.^[6] The third ratio, where Canton scored in the upper 25th percentile, was Debt Service/Total Revenues. A relatively low indicator of debt structure is important for a city’s ability to meet its debt service obligations in a timely manner.

	Score	2	0	2	(1)
Total score		Canton 9	Loraine (2)	Mansfield 5	Springfield 3

Although Canton did not score in the lower 25th percentile in any of the ratios, there are some areas of comparable weakness (25th–50th percentile score). Canton is somewhat reliant on intergovernmental revenue in its general fund (see ratio 2). This leaves the city more exposed to the whims of the Congress or the State legislature. Another area where the city may need more work is in ratio 4, Operating Expenditures/Total Expenditures. Its higher score indicates that the maintenance and building of infrastructure

may not be getting adequate attention. Canton also scored lower in unreserved fund balances and relative liquidity. Lower relative fund balances indicate that Canton might not be as well suited to meet a fiscal emergency as a similar city. Lower levels of cash and short-term investments could indicate an inability to meet short-term obligations.

Canton's overall score was nine. This puts Canton in the 75th percentile according to Dr. Brown's Test. The relative strength in the current position means that

Canton, at least in the short run, should be able to meet its obligations in both providing services to its citizenry and meeting its financial commitments.

CITY OF LORAIN, OH

Loraine is the largest city in Loraine County, located in northeastern Ohio. It was incorporated in 1874, and is located about 30 miles west of Cleveland. The 1998 U.S. Census Bureau estimate of population for the City of Loraine was 68,857, a decline of 3.4% from the 1990 figure of 71,245. Lorain, too, operates as a statutory city under the laws and regulations set forth in the Ohio Constitution. Legislative authority is vested in a city council and the executive authority in the mayor (mayor–council government). As in Canton, the main source of revenue from the operations of the city government is the collection of income tax, which represented 63% of general fund revenues. Loraine provides police protection, firefighting and prevention, public health services, street maintenance and repairs, building inspection, parks and recreation, water, and sewer.

Ten-Point Test scores for Financial Position were very low (e.g., no score in the upper quarter in any ratio, two scores in the 50th–75th percentile, and four scores in the bottom quartile of the 10 ratios). Scores for the ratio of revenues to population indicate a deficiency in annual resources. The ratio of operating expenditures to total expenditures is too high, indicating substandard attention to infrastructure. The unreserved general fund balance is too low compared with total general fund revenues, and Loraine seems to have relatively low short-term liquidity as evidenced in its low ratio of cash and short-term investments to total general fund liabilities.

Overall, the City of Lorain scored a –2, putting it in just the 5th percentile. That means that 95% of cities scored higher. A long-term trend analysis would seem to be prudent to rule out whether there are some underlying long-term issues that need to be addressed.

CITY OF MANSFIELD, OH

Mansfield is the county seat and the largest city in Richland County, located approximately 65 miles northeast of the city of Columbus. Mansfield was incorporated in 1808 and operates with the mayor–council form of government. The 1998 U.S. Census Bureau population estimate was 49,802, a decline of 1.6% from the 1990 figure of 50,627. Like most cities in Ohio, Mansfield relies on municipal income tax as its main source of revenue (50.5%). Mansfield provides traditional municipal services (police, fire, recreation,

streets, etc.) as well as operates an airport, a parking garage, and water and sewer utilities.

Mansfield had three areas of relative strength (75th percentile), and they were the same as Canton. The city's per capita revenue indicated adequate resources, its ratio of total revenues to total expenditures was strong, and its debt service levels were manageable. Mansfield did score in the lower quartile in three areas. The city seems too dependent on intergovernmental revenues in its general fund, indicating some vulnerability to outside governmental entities. Its liquidity was relatively low, whereas the ratio of general fund liabilities to general fund revenues was too high, indicating that short-term obligations might not be easily serviced by the normal flow of annual revenues. Mansfield scored a five overall on Dr. Brown's Ten-Point Test, which puts the city firmly in the middle at the 50th percentile. That means half of the cities analyzed will score higher and half will score lower.

CITY OF SPRINGFIELD, OH

Springfield Ohio is the county seat and largest of Clark County, located in southwest Ohio. It is the only city in this analysis that is located in the southern part of the state. It was incorporated in 1850, although its roots date back to the 18th century. The city enacted a charter in 1913 that provides home-rule powers to the city under a city commission–manager form of government. The 1998 U.S. Census Bureau estimate of population for the City of Springfield was 65,568, a decline of 6.96% from the 1990 figure of 70,487. Municipal income taxes represent 71.5% of general fund revenues. The city provides traditional municipal services, as well as operates an airport, golf courses, and a sewer system.

Springfield did not score in the upper quartile in any ratio in Dr. Brown's Ten-Point Test. It did score in the 50th–75th percentile range in 4 of 10 ratios. Per capita revenues seem relatively healthy, whereas the general fund seems relatively independent from outside revenue sources. The city appears to be investing an adequate amount in infrastructure, and its current year operating position (total revenues/total expenditures) was also slightly above the median.

Springfield scored in the 25–50th percentile in 5 of 10 ratios. Fully 90% of its scores was within the 25th–75th percentile. Springfield scored in the lowest quartile in the 10th ratio, Debt Service to Total Revenues, indicating a weakness in its ability to meet debt service requirements. This performance was reflected in its final score, a three. The score puts Springfield in the 25th percentile, which means that 75% of the cities analyzed scored higher.

In summary, according to Dr. Brown's Ten-Point Test, the four Ohio cities rank as follows:

Rank	City	Score	Percentile
1	Canton	9	75th
2	Mansfield	5	50th
3	Springfield	3	25th
4	Loraine	(2)	5th

The data to calculate the 10 financial ratios are readily obtainable from most CAFRs. Except for population, which is usually disclosed in the statistical section, data for the first four ratios can be obtained from the Statement of Revenues, Expenditures, and Changes in Fund Balances—Governmental Funds and Balance Sheet—Government Funds. Data for the remaining ratios usually can be found in the Notes to the Financial Statements. In determining ratios 1–8, some analysts prefer to utilize general fund data only, whereas others use combined data for all governmental fund types. This decision will depend, in part, on how large the general fund is relative to all governmental fund types. In determining operating revenues, capital project fund revenues should be excluded because the capital project fund is not an operating fund.

In addition to analyzing ratios, the stability, flexibility, and diversity of revenue sources; budgetary control over revenues and expenditures; adequacy of insurance protection; level of overlapping debt; and growth of unfunded employee-related benefits should also be evaluated. Socioeconomic and demographic trends should be analyzed as well, including trends in employment, real estate values, retail sales, building permits, population, personal income, and welfare. This information is found in the CAFR and the U.S. Census.

CONCLUSION

Financial condition analysis relies heavily on analysis of BFS, including the notes that accompany them. The notes are especially useful for determining the

structure of the entity, accounting methods used, assumptions made, and other background information that gives the reader a perspective as the financial statements are reviewed. In addition, financial condition analysis must take into consideration additional external factors such as debt per capita, tax rates, and citizen income and wealth. The use of ratios, such as Dr. Brown's Ten-Point Test or ICMA ratios, is also appropriate for financial condition analysis. Financial condition analysis is complex because the business of government is complex. For example, a local government's population might be growing but property values might be stagnant. There may be high property values but also high debt per capita. In any financial condition analysis, comparison with a relevant group should be made, and strengths and weaknesses should be considered as a whole in making a reasoned assessment about financial condition.

Financial Emergencies

Jane Beckett-Camarata

Department of Political Science, Kent State University, Kent, Ohio, U.S.A.

INTRODUCTION

Financial emergencies in U.S. local governments are an ongoing, significant, and complex public policy issue for legislators, state, and local officials and citizens. For our purposes, a financial emergency is defined as a formal legal declaration by a state government of local government financial default. Such formal legal declarations are in response to a local government's negative account imbalances (e.g., general fund imbalances); that is, the inability to provide basic services; the inability to meet payroll, service debt, pay vendors, or pay retirement fund obligations; or the inability to meet its significant financial obligations.

Financial (fiscal) emergencies have serious negative consequences for the local government, the community, the region, and the state. The end result of a financial emergency is reduced services, lower quality of life, and a threat to the physical infrastructure and safety. Each state has its own unique way of dealing with inadequate local government fiscal conditions. However, most attempt to address these inadequacies through a four-stage fiscal health/financial emergency continuum. The four stages in the continuum are: 1) fiscal health; 2) fiscal watch or monitoring; 3) fiscal stress; and 4) fiscal emergency. Local governments with fiscal emergencies must develop and implement strategies for eliminating the actual fiscal emergencies as well as the causes. Inadequate fiscal conditions at the local level are a problem for the state as a whole as well as for the local community. Most states have laws that govern fiscal emergencies. For example, the cities of Miami, Florida, and Washington, DC, have been in a state of public receivership. The financial management of both cities was handed over to public boards until fiscal integrity was restored. In the case of Washington, DC, a Memorandum of Agreement between the District of Columbia Financial Responsibility and Management Assistance Authority conveys back to the Mayor of Washington, DC, control over operations, but retains statutory oversight responsibilities.

In addition to state laws governing fiscal emergencies, local governments can file for bankruptcy under Title 9 of the U.S. Bankruptcy Code. If a local government files for bankruptcy under Title 9 and the state is silent on the filing, it is tantamount to authorizing the municipality to file under federal bankruptcy law.^[1]

Bankruptcy applies only to instances for which there has been a formal filing of a bankruptcy petition under [Chapter 9](#) of the Federal Bankruptcy Act (www.accessgpo.gov). To file a bankruptcy petition, the government must declare itself insolvent. Either a general-purpose local government or a special district can file this petition. Orange County, California, filed for bankruptcy because of unsound investment practices.

State-authorized eligibility to file for bankruptcy under Title 9 is a Tenth Amendment issue that is central to bankruptcy proceedings.^[1] Georgia, for example, prohibits municipalities from filing and Pennsylvania requires prior state permission. Other states expressly and specifically grant municipalities the authority to file for bankruptcy.

THE FISCAL HEALTH/FISCAL EMERGENCY CONTINUUM

A local government's fiscal health can be viewed as part of a four-stage fiscal health/fiscal emergency continuum ([Fig. 1](#)). The term fiscal emergency represents stages two, three, and four of this continuum, with each succeeding stage representing a declining level of fiscal health and adequacy. For example, a local government in stage one is in sound fiscal health. In stage two, the locale is showing early signs of fiscal problems such as general fund account imbalances. In stage three, the fiscal concerns are much more significant in that the locale not only has a general fund imbalance, but is also unable to provide adequate basic services to its community. In stage four, in addition to the items in stage three, they cannot meet payroll, service debt, pay vendors, pay retirement fund obligations, or meet other significant financial obligations. Stage four is a true fiscal emergency.

ANALYZING FISCAL HEALTH

Over the past several years, the regularity of financial emergencies in several states has confirmed the need for an effective system to provide taxpayers, creditors, managers, and legislatures, and others with timely notice of the situation. In most instances, financial constraints, coupled with financial reports (both internal

Fig. 1 Fiscal health/fiscal emergency continuum.

and external) of the local governments, did not provide information as to the nature of the fiscal problems until it was too late. In spite of improvements in financial reporting, fiscal emergencies continue to occur. Preventing fiscal emergencies requires an ongoing system of financial monitoring that can provide a warning of fiscal problems that may affect the community.

Credit Analysis

Credit agencies (e.g., Moody's, Standard and Poor's) examine both *structural* and *budgetary* factors, such as 1) economic; 2) financial; 3) debt; and 4) administrative/political. Standard and Poor's emphasizes debt factors (25). Moody's emphasizes the issuer's economic base.^[2] However, both Moody's and Standard and Poor's examine factors in each of the four groups. The ratings are viewed as one indicator of long-term financial condition. For example, Moody's Aaa rating indicates a city is likely in better financial position than a city with a Baa rating (the lowest *investment grade* rating). Further, ratings assigned to general obligation (GO) bonds often apply to all GO bonds of the same issuer.

A local government's fiscal health is its ability to meet its financial obligations as they become due and to deliver fundamental public services to its residents. One way that fiscal health can be assessed is by analyzing a local government's fiscal health over time. In addition to looking at the changes in financial indicators of fiscal health and relationships among indicators, environmental factors such as community needs and resources, economic conditions, political culture, intergovernmental constraints, and natural disasters and emergencies largely determine revenue capacity and demand for services. The way in which a local government responds to environmental demand and changes in the environment is a major factor in determining how environmental factors are translated into fiscal health.

State Government Analysis

There are various ways to analyze fiscal problems. A municipality in Ohio, for example, may fail certain policy criteria for fiscal emergency at year-end, but correct its fiscal situation in time to avoid state control. For example, existence of any year-end emergency criteria

is not a fiscal emergency if the emergency criteria do not exist at the time of the fiscal emergency audit.^[3] Ohio policy requires calculations at the prior year-end at the time of the fiscal emergency audit. Although the Ohio fiscal emergency policy delineates fiscal emergency, it is silent on the causes. It is also silent on fiscal emergency prevention strategies. The Ohio fiscal emergency policy is primarily intended as a remedial action to restore a local government's fiscal soundness. The Ohio State Auditor declares that a particular local government has a fiscal emergency. The State Auditor may initiate a review based on problems through its audit function of the state, or the governor, mayor, or presiding officer of the local government can request a fiscal emergency analysis.

Ratio Analysis

An important part of analyzing fiscal health is the use of ratios. Ratios help management and external users proactively understand the local government's strengths and weaknesses. A better understanding of strengths and weaknesses can lead to corrective action before a fiscal emergency occurs. In financial statement analysis, ratios are used to compare numbers taken from the financial statements. For instance, knowledge about how much a local government had in assets compared with current liabilities may be desired. If the Town of Bainbridge, for instance, had \$61,900 in current assets compared with its current liabilities of \$14,000, the comparison is done by dividing one number by the other. If we divide \$61,900 by \$14,000, the result is 4.4. This means that there are 4.4 dollars of current assets for every one dollar of current liabilities. This would be referred to as a ratio of 4.4 to 1 or simply a ratio of 4.4. This ratio is called a *current ratio*.

Ratios are used because the comparison between two numbers generates information that is more useful than either or both of the numbers separately. If we know that the town has \$61,900, that does not tell us whether it has adequate short-term resources to meet its obligations. Knowing that we have 4.4 dollars of liquid assets for each dollar of short-term liabilities tells us much more about the relative safety of the organization. Each local government has to develop its own set of useful ratios about its fiscal health. For example, the ratio of total revenues to total expenditures indicates the relationship of inflow from

revenues to outflow for expenditures; a high ratio is viewed as positive.

In addition to evaluating ratios, the stability, flexibility, and diversity of revenue sources; budgetary control over revenues and expenditures; adequacy of insurance protection; level of overlapping debt; and growth of unfunded employee-related benefits. Socio-economic and demographic trends should also be analyzed, including trends in employment, real estate values, retail sales, building permits, population, personal income, and welfare. Much of this information is contained in the statistical section of the Comprehensive Annual Financial Report (CAFR), if the local government prepares a CAFR.

Operational Definitions

There are two basic *operational* definitions of fiscal emergencies: 1) *structure* and 2) *budget*. The *structural* definition outlines a fiscal emergency in terms of the *external* constraints that are placed on the local government's fiscal health by the local economy (its economic base) and by the population demographic structure. The *budget* definition characterizes fiscal emergencies in terms of internal *budget* actuality. That is, the inability of local governments to balance their budgets, regardless of the causes of the problem. For example, fiscal mismanagement can cause a *budgetary* fiscal emergency, as well as sudden changes in local revenues (loss of major taxpayer or intergovernmental aid) or change in community needs (e.g., a catastrophe or sudden growth).

Legal Definitions

Within the budgetary category, there are legal definitions for three categories of budgetary fiscal problems. For example, in Ohio, the state auditor declares: 1) *fiscal watch/fiscal monitoring*; 2) *fiscal stress*; and 3) *fiscal emergency, under the following conditions*:

1. *Fiscal Watch/Fiscal Monitoring*: This status is declared to provide early warning to local governments whose finances are approaching fiscal stress. Local governments are monitored by the state when a deficit exists in the General Fund or other funds and when such deficit exceeds one-twelfth of total General Revenue Funds. It is declared when any one of the following factors exist:
 - All accounts that are due and payable from the General Fund for more than 30 days, less the year-end balance of the General Fund

exceeds one-twelfth of the General Fund budget for the year.

- All accounts that are due and payable from all funds for more than 30 days, less the year-end balance in these funds, exceeds one-twelfth of the available revenue for the preceding fiscal year from these funds.
- Total deficit funds, less the total of any balances in the General Fund and in any special fund that may be transferred to meet such deficits, exceeds one-twelfth of the total General Fund budget for that year and the receipts to those deficit funds during that year (other than transfers from the General Fund).
- Money and marketable investments, less outstanding checks, less total positive fund balances of general fund and special funds, exceeds one-twelfth of the total amount received during the preceding fiscal year.

2. *Fiscal Stress*: This status is declared when and one of the fiscal watch/fiscal monitoring factors are present, and there is an inability to fund service delivery needs and requirements because of a decrease in resources and an increase in demands for resource utilization.
3. *Fiscal Emergency*: This status is declared when, in addition to fiscal stress conditions, there is a failure to meet significant financial obligations. This classification includes cases in which governments have failed to meet principal and interest payments on their debt; failed to meet payrolls, pay vendors, or pay retirement fund obligations; or failed to meet other significant financial obligations. In most instances, these emergencies are confirmed by the state declaring the local government in a financial emergency.^[3]

CAUSES OF FISCAL EMERGENCIES

There are five broad *causes* of fiscal emergencies:

1. Socioeconomic decline (i.e., "regional or national forces, principally economic and demographic, that have weakened city tax bases and strained local services").
2. Local political factors largely relating to disproportionate demands for public services from specific groups or from unions, changing electoral coalitions that call for increased government spending to reward the partners of winning coalitions, and local political cultures that are supportive of different levels of public spending.

3. Government growth through inevitable dynamics of bureaucratic expansion, giving rise to increased expenditures.
4. Poor fiscal management practices.
5. State policies limiting revenue and expenditures.^[4]

The first cause relates to the *structural* definition of fiscal problems, as discussed above. The last four relate to the *budgetary* definition of fiscal problems also discussed above.

Some cities are candidates for fiscal emergencies because some local government managers take a short-term view, surviving each fiscal year by “getting by” or short-run tactics that may detract from the local government’s long-term fiscal integrity. Although they cannot correctly be described as having financial mismanagement, two types of shortcomings still exist. First, it is difficult to determine a local government’s vulnerability to a fiscal emergency from its published budget, balance sheet, and income and expense statements without also being familiar with its local policies and accounting method. Second, comparison of operating revenues and expenditures is also challenging if there is no capital budget, or if there are numerous operating funds.

Inferences drawn from the both the literature and state fiscal emergency laws might suggest the following interrelationships (Fig. 2).

VISIBLE SIGNS OF FISCAL EMERGENCIES

Some visible signs of a fiscal emergency are:

1. A decline or inadequate growth in revenues relative to expenditures.

2. Declining property values.
3. Declining economic activity (e.g., increasing unemployment, declining retail sales, declining building activity).
4. Erosion of capital plant, particularly infrastructure.
5. Increasing levels of unfunded pension and other postemployment obligations.
6. Inadequate capital expenditures.

Signs such as these, especially if several exist simultaneously, may indicate a potential fiscal emergency unless the local government takes immediate action to increase revenues or decrease spending. The typical sign of a fiscal emergency is fund deficits. There are three fundamental explanations for municipal fund deficits: 1) increased costs associated with state mandated (funded and unfunded) programs; 2) local plant closings; and 3) decreased income tax base.^[5] Mandates, which are typically new unfunded programs or procedures, approved by a state legislature or Congress and implemented at the local level, contribute to fund deficits. Many of these unfunded mandates relate to health care for the indigent population, the administration of the court system, the administration of the prison system, the education system, and the mental health system.

Fund deficits are affected by other constraints placed on municipal governments. For example, municipalities confronting a declining tax base may be unable to raise additional revenue in the short run because of state laws limiting tax increases, bond indebtedness, or the use of special revenue mechanisms. In addition, some states such as Ohio are overly reliant on local income taxes, which are adversely affected by local plant closings.

Fig. 2 Fiscal emergency model. (*) Unique catastrophic environmental occurrence; (1) minimal informal monitoring; (2) extensive informal monitoring; (3) formal intervention and oversight.

Taxing powers have a central role in fiscal emergencies. Taxing powers are important because their applicability defines different credit instruments, including general obligation bonds. Taxing powers may be constrained by tax-and-expenditure limitations. Some local tax-and-expenditure limitations have been on the books for decades. The ostensible purpose behind statewide tax-and-expenditure limitations on local jurisdictions is often enforcing governmental economy; the structure, rather than the size, appears more likely to be affected, and the long-term outcome is the centralization of the state-local fiscal system. In some instances, a tax increase may be counterproductive to the community because it is also accompanied by a reduction in services. In the case of Bridgeport, Connecticut, unless the city increased services without increasing property taxes, it would suffer property value losses, job flight, loss of businesses, and a fall-off of middle-class residents. Municipalities are in competition with their surrounding suburbs; therefore, a high proportion of relocatable retail and service-sector jobs and businesses will leave.

Measures associated with loss of financial flexibility include: 1) the proportion of own source revenues dedicated to matching funds; 2) the percentage of expenditures funded from grant funds; 3) the debt burden indicated by the ratio of general obligation long-term indebtedness to municipal population or the ratio of debt service payments to total own-source revenues; 4) the budget overruns indicated by the year-end expenditures over the original budget; 5) the ratio of the legally authorized tax rate over the current tax rate; and 6) the proportion of municipal expenditures allocated for covering mandates.^[6]

STATE FINANCIAL RECOVERY LAWS

States respond to signs of a fiscal emergency through the use of fiscal recovery laws. In Ohio, the fiscal emergency law is primarily intended to restore a local government's fiscal soundness through the use of a fiscal commission and state auditor oversight. The Ohio State Auditor is responsible for certifying that a particular local government has a fiscal emergency. The state auditor may initiate a review based on problems through its audit functions of the state or the governor, mayor, or presiding officer of the local government can request a fiscal emergency analysis.

State Oversight Commission

Once the state auditor has determined that a fiscal emergency exists, the governor appoints a Financial Planning and Supervision Commission to work with

the local government. The commission has eight members:

1. State Treasurer.
2. Director of the State Office of Budget and Management.
3. For municipalities, the mayor and presiding officer of the local government legislative authority.
4. For counties, the president of the Board of County Commissioners and the county auditor.
5. For townships, a member of the board of township trustees and the county auditor.
6. Three appointed members chosen out of five names provided to the governor by the mayor and presiding officer of municipal legislative authority, or by the county board of commissioners or board of township trustees. These individuals must be residents of the declared government (by home or office address) with at least 5 years private sector business/financial experience.^[3]

Responsibilities of a State Oversight Commission

In Ohio, for example, the Oversight Commission is responsible for approving a financial recovery action plan to essentially eliminate fiscal emergency conditions, balance the budget, and avoid future deficits and market long-term obligations. The mayor, board of commissioners, or board of trustees must submit the plan to the commission within 120 days of its first meeting. The commission can either accept or reject the plan. The above officials then have 30 days to resubmit a plan, and the process is repeated until a plan is accepted.

The Oversight Commission has far-reaching authority to: 1) review all revenue and expenditure estimates to ensure a balanced budget; 2) require the government (by ordinance or resolution) to maintain monthly levels of expenditures and encumbrances consistent with the financial plan; 3) approve and monitor expenditure and encumbrance levels; 4) approve the amount and purpose of any debt issues; 5) make and enter into all contracts and agreements necessary to the performance of its duties; and 6) make recommendations for cost reductions or revenue increases to carry out the financial plan.

All financial transactions require commission review and approval. The commission reviews the local government's budgets, tax levy ordinances, and appropriation measures. It approves the purpose and amount of any debt obligation. It also serves as an adviser on the structure and terms of debt obligations, on

methods to increase revenues, and on ways to reduce costs.

The use of a commission or board forces fiscal discipline on the municipality and typically represents state control over financial performance. A commission or board, by having state representation, provides leverage in remedying the problem and holds the local officials accountable for restoring fiscal health.^[7] To accomplish its work, a commission needs such extensive oversight. Municipalities in financial emergency must comply with the commissions' requirements. Municipalities under financial emergency must also comply with certain legal requirements. In Ohio, as noted above, the municipality must present its financial plan to the commission within 120 days of its first meeting. The plan must include the municipality's proposals for eliminating all fiscal emergency conditions and deficits, paying all overdue bills, restoring fund moneys, balancing the budget, and regaining the ability to market long-term general obligation bonds. Also included is an action plan for carrying out the plan and preventing a new fiscal emergency from arising in the future. Failure to submit a timely financial plan results in an automatic spending restriction in the general fund. The spending ceiling is 85% of general fund expenditures for that month in the preceding year. Fiscal discipline imposed by commissions usually results in managing within existing resources and not increasing the tax rate.

The Oversight Commission assists the municipality in developing sound financial practices to prevent future financial problems. The change in practices requires an improvement in the local government's internal capacity to identify and manage fiscal problems before they escalate. The local government must have a decision-support system that provides adequate and timely data for management decision making. It must also have accountability at each level of government.

ADDRESSING FISCAL EMERGENCIES

Local governments respond to fiscal emergencies by using several different strategies. First, they immediately tighten fiscal controls. Many use short-term strategies such as freezing/cutting the workforce and non-workforce expenditure reductions. Long-term strategies, the key to sound financial management, include putting more clarity and order into the local government's fiscal process and initiating an economic development program. This means 1) revising the budget formulation process; 2) controlling expenditures; 3) ensuring that an economic development program is in place and is maximized; and 4) initiating productivity and efficiency programs.

The local government response to the fiscal emergency should have a positive impact on its fiscal health. In New York, like Ohio, a municipality in financial emergency must prepare a multiyear financial plan for approval by the commission. These multiyear plans allow local decision makers to decide service allocations, but within revenue estimates and spending plans monitored by the commission.

Termination of the State Oversight Commission

To end state supervision, Ohio municipalities, for example, must comply with the following:

- An effective financial accounting and reporting system is being implemented with expected completion within 2 years.
- All fiscal emergency conditions have been or are in the process of being eliminated, and no new emergency conditions have occurred.
- The financial recovery plan objectives are being met.
- The entity has a 5-year financial forecast that the State Auditor determines is "non-adverse."^[3]

Other Fiscal Emergency Oversight

In Florida, the tests for meeting a municipal fiscal emergency are similar to those in Ohio, but the governor has the discretion to design a response to the local problem. The Florida Statute allows the Florida governor's office to informally consult with officials regarding the appropriate steps necessary to rectify the problem.^[8] New Jersey's laws are similar to Ohio and Florida, but in New Jersey discretion resides in a board rather than the governor.^[7]

New York State operates on a case-by-case basis, and a state law dictates the response to each particular fiscal emergency. In Pennsylvania, the head of the Department of Community Affairs appoints a department employee or a consultant as the coordinator of the municipality in fiscal emergency. The Pennsylvania Municipalities Financial Recovery Act (Act 47) governs fiscal emergencies. The act provides a range of grants local governments in fiscal emergency, including:

1. *Shared Municipal Services*: Grant funds are provided to promote cooperation between neighboring municipalities enabling various functions to be provided more efficiently and effectively.
2. *Local Government Capital Projects Loan Program*. Provides low-interest loans (2%) to municipalities (under 12,000 in population) to assist with the purchase of equipment and facilities.

3. *Land Use Planning and Technical Assistance Program*: Provides grants to municipalities, counties, and other units of local government for multimunicipal planning efforts that further the sound land-use initiatives.
4. *Regional Police Assistance Grant Program*: Provides grants for the start up of consolidated police departments for a period of up to 3 years.
5. *Floodplain Land Use Assistance Program*: Provides reimbursement for 50% of the eligible expenses connected with a municipality preparing, enacting, and implementing or administering floodplain management regulations.^[9]

CONCLUSION

Fiscal emergencies are a significant and complex public policy issue because such emergencies have serious negative consequences for local government, community, region, and the state. A fiscal emergency can lead to low quality of life and to reduced services. Fiscal emergencies are a state problem as well as a local problem. Each state has its own unique way of dealing with the emergency, although there are four generic fiscal strategies for eliminating fiscal emergencies. These strategies generally operate through state laws governing fiscal emergencies. As discussed above, states generally respond to fiscal emergencies by oversight through the use of Fiscal Emergency Laws and oversight boards.

The State Fiscal Emergency Laws used in Ohio, for example, in aiding municipalities' experiencing fiscal

problems appear to have a positive effect on long-term local government financial performance.^[5] What was once a financial "last resort" has become to some degree a less exceptional, more acceptable political option for assisting local governments in restoring fiscal health. Proactively preventing financial problems is the joint responsibility of states, local governments, and citizens. State legislative bodies are responsible for sound fiscal policies for the government they serve. Oversight bodies such as fiscal emergency oversight boards have responsibility for monitoring and, in some cases, establishing the fiscal policies of governmental units for which they have oversight responsibility.

Financial Resource Management in Local Government

Kenneth A. Klase

*Department of Political Science, University of North Carolina at Greensboro,
Greensboro, North Carolina, U.S.A.*

INTRODUCTION

Financial resource management in local government involves a multitude of techniques and approaches focused on the financial management of resources to accomplish local government aims. Financial resource management occurs within diverse local government environments that profoundly influence it. Decision making in the local government fiscal system is shaped by the underlying local social and economic conditions, the formal authority structure of the local government, and by other stakeholders in the decision-making process. Fig. 1 shows the relevant factors involved and the interrelationships among factors in the process of decision making in local government financial resource management, including social and economic factors (community needs and resources); formal authority structure (degree of local government autonomy or home rule granted in state-local relations, especially with respect to financial management decision making); interest groups and other government agencies (political strategies developed and coalitions formed around particular issues). All these factors define the specific political and organizational environment, ultimately affecting financial decisions and outcomes.^[1]

STRATEGIC MANAGEMENT AND MANAGEMENT CONTROL

Although an environment such as that described above places constraints on the potential goals and strategies of local governments, local government financial resource management is most successful when performed within a strategic management context. Resource management provides the critical link between formulation of goals and objectives in a strategic planning process and the actual performance of local government activities. Local government is concerned about the effective allocation of public resources to carry out plans, strategies, and programs. Financial management is involved in the acquisition of resources and in the tracking of performance, resulting from the allocation of financial resources used to satisfy the demands of constituents within financial constraints. Thus, financial resource management

focuses on planning for achievement of desired results, implementation of those plans, and taking appropriate actions to control results so they conform to the plans. What has actually occurred must be determined, and then these actual outcomes must be reported through the financial reporting process.^[2-4]

These aspects of financial resource management are accomplished through the management control process. Management control occurs through a management control structure consisting of responsibility centers (e.g., program structures or service units) working toward the accomplishment of specific objectives. The management control process involves determining appropriate programming or activities to address strategic goals and strategies; budget preparation of a budget plan for implementing program objectives; operations and measurement in which resources are consumed and actual results attained; and reporting and evaluation where accounting and other information is summarized, analyzed, and reported. The information from reporting is used to help achieve local government goals by controlling current operations, evaluating operating performance, and performing program evaluation.^[5]

FINANCIAL MANAGEMENT FUNCTIONS

Basic functions common to financial management emphasize control, cost management, and planning. These functions include accounting and control mechanisms, allocation and management of existing resources through cost management, and long-term financial planning techniques for assessing the long-term needs of the organization and for acquiring the needed resources. Fig. 2 illustrates the principal financial management functions in local government and their emphases. Accounting and financial reporting emphasize control. Functions emphasizing cost management include cost allocation and cash management. Planning is emphasized by the functions of operations budgeting, capital budgeting, and debt administration. It is the individual functional components of financial management described in Fig. 2 that enable financial resource management to be accomplished and the management control process to function. These

Fig. 1 A model of local government financial resource management. (Source: Ruchelman, Leonard I. "The Finance Function in Local Government." In Aronson, J. Richard and E. Schwartz, eds. *Management Policies in Local Government Finance*, 3rd edition. Washington D.C.: ICMA, 1987, p. 23.)

essential tools for managing public resources include appropriate mechanisms for accounting control and reporting of financial information, rational procedures for allocating resources and controlling costs, and techniques for assessing long-term needs and for acquiring needed resources.^[6]

Accounting and Financial Reporting

Financial accounting control systems are important components of financial resource management because of their role in record-keeping and financial control

functions. They are important not only for financial record-keeping and external reporting, but also because accounting serves as the basis for management planning, decision making, and control. Financial accounting is concerned with the results of fiscal transactions and the resulting financial position of the local government. Generally accepted accounting principles (GAAP) are the rules, guidelines, or accounting conventions used for reporting on financial transactions and creating an organization's financial statements so that they fairly represent the organization's financial position and results of operations. For state and local governments, GAAP are established by the

Fig. 2 Emphasis of principal financial management function in local government. (Source: Adapted from Steiss, Alan Walter. *Financial Management in Public Organization*, Brooks/Cole Publishing Company: Pacific Grove, CA, 1989, exhibit 1-1, p. 5.)

Governmental Accounting Standards Board (GASB), an authoritative body associated with the Financial Accounting Standards Board, which determines GAAP primarily for private sector organizations; both are private sector organizations that promulgate accounting standards for accounting professionals.^[7] Traditionally, GAAP has required fund accounting as the primary mechanism for control of governmental activities. Under fund accounting, resources are segregated into individual funds according to designated purposes, and reporting is performed within the fund structure. The major categories and fund types used in state and local fund accounting include the following:

- *Governmental funds* used to account for general government operations. Generic fund types classified as governmental include the *General Fund* for all resources not required to be accounted for in another fund; *Special Revenue Fund* to account for resources legally or administratively restricted for specific purposes; *Capital Projects Funds* used to account for resources restricted for major capital outlays; *Debt Service Funds* to account for resources used to repay principal and interest on general-purpose long-term debt.
- *Proprietary funds* used to account for government activities similar to commercial activities in the private sector. *Enterprise funds* are used to account for operations financed and operated similar to a business enterprise (e.g., public utilities), and *internal service funds* are used to account for operations that provide goods or services to other departments on a cost reimbursement basis (e.g., motor pool, data processing, or print shop).
- *Fiduciary funds* used to account for assets held by government in a trust or agent capacity, including *agency funds*, *pension trust funds*, *expendable and non-expendable trust funds*.

To accomplish financial accounting and reporting of fiscal transactions in local government for these fund types, what is measured and when it should be measured must be determined. The spending measurement focus emphasizes spending or the financial flow of funds by reporting only current assets and liabilities, and the difference between them or what is available to be spent in the current accounting period. In contrast, the capital maintenance measurement focus reports on all assets and liabilities (short and long term), and the difference between them or the capital or equity of the fund. Accounting principles require that a different basis of accounting be used to determine what transactions should be recognized for reporting purposes, depending on measurement focus differences between fund types. The modified accrual basis of accounting emphasizes a financial flow or spending measurement

focus, records revenues when they are measurable and available, and records expenditures when they are measurable and incurred (to be paid from current resources). Because a financial flow or spending focus applies, fixed assets are an operating expenditure and only accounted for as a general fixed asset, accounting for depreciation (representing the orderly write off of some portion of the value of fixed assets used up in producing a product or service) is optional, and long-term debt is handled as a general liability rather than a liability of a specific fund. The accrual basis of accounting emphasizes a capital maintenance or equity focus, records revenues when measurable and earned (service has been provided), and records expenses when measurable and incurred (liability created). Because a capital maintenance focus applies, fixed assets are an asset of the specific fund where purchased, depreciation is an expense for the fund-owning fixed assets, and long-term debt is a liability of the specific fund where issued. Thus, measurement focus and consequent basis of accounting depend on fund type: governmental funds and fiduciary funds with a spending or flow of funds measurement focus are accounted for under modified accrual accounting, whereas proprietary funds and fiduciary funds with a capital maintenance measurement focus are accounted for under accrual accounting.^[8]

Accounting changes for state and local government accounting and reporting under GASB Statement 34 have added to this model of fund accounting additional requirements for comprehensive entity reporting by local governments. Implementation of changes by local governments are being phased in according to the size of annual revenues for the local government, but will be fully implemented by 2003. The changes in reporting requirements are being implemented to enhance the understandability and usefulness of financial reports to various users who often find fund accounting complex and unintelligible. The new requirements focus on moving from reporting separately for different types of funds to reporting for the entity as a whole through two governmentwide statements (Statement of Net Assets, essentially an accrual accounting Balance Sheet and Statement of Activities, essentially an accrual accounting Operating Statement) as part of the basic financial statements for the government. In addition, governments are also required to continue fund financial statements. Perhaps most useful to users of the basic financial statements, local governments are required under the GASB 34 changes to provide a management's discussion and analysis section and other required supplementary information, including a comparison of actual results with authorized budgets. These interpret the financial statement information in a more understandable manner for users.^[2,9-11]

Cost Allocation and Cash Management

The cost analysis/allocation and cash management functions in financial resource management emphasize cost management, as shown in Fig. 2. Cost management depends on information available from accounting control systems. Local government accounting systems do not generally generate good cost data, given the financial flow measurement focus of governmental fund types. Consequently, local governments engage in cost analysis/allocation. Analysis of costs is used to forecast short- and long-term needs, and provides input to cash management decision making and long-term financial planning. Cost accounting approaches attempt to determine the full costs of local government service delivery and to assign accountability for costs to the appropriate local government responsibility center. Through cost analysis, costs can be classified as direct (costs directly associated with a specific purpose) or indirect (costs associated with more than one activity and not able to be traced directly to any one of the activities). Cost allocation involves allocating indirect costs or overhead using some basis of allocation (e.g., number of square feet that a cost center occupies) to specific cost centers to arrive at a more accurate measurement of the full costs (direct plus allocated indirect) for those cost centers. In addition, determination of fixed and variable costs can enable differential cost analysis for alternative decision making.^[6,12]

Cash management also emphasizes cost management and is concerned with short-term cash flow management, cash mobilization, and investment. Short-term cash flow management involves ensuring that adequate cash resources are available in a timely manner when needed for current operations to avoid cash shortages. Many organizations prepare a cash budget, usually indicating month by month how much cash is forecasted to be received or paid. The most difficult problem is accurately estimating receipts. Forecasted deficits in cashflow require borrowing, while surpluses allow for short-term investments to be made. Cash management also involves cash mobilization as a technique to assemble funds and make them more readily available for investment. Cash mobilization is accomplished through accelerating receivables (reduction of time delays in collecting receivables or deposit float) and controlling disbursements (especially delaying cash outflows through disbursement procedures and consolidated concentration accounts). Cash is mobilized to maximize investment return on temporary cash balances. The principal factors considered in selecting appropriate investment options for public funds are safety/risk, liquidity/marketability, maturity, and yield. Appropriate investments for local governments are often confined to certificates of deposit, U.S. Treasury bills, other federal agency securities, and state

investment pools. Interest earned on investments is an important benefit of good cash management, but safety and liquidity of cash assets have to be balanced against possible yield.^[6,13,14]

Operations Budgeting

The operations budgeting component of financial resource management emphasizes planning as depicted in Fig. 2, but is traditionally viewed as a control mechanism to ensure legal compliance and accountability through appropriation to specific objects of expenditure linked to budgetary accounting. The most common operating budget format in local government, the line item budget, appropriates funds to specific line items in this fashion and is oriented toward controlling expenditures in accordance with fiduciary accountability. Significant management and planning capacity can be incorporated into the operations budgeting process where performance and program budgeting formats and approaches are used. The performance budget is organized around tasks, activities, or direct output performed. It emphasizes expenditure by workload or activity and unit costs by activity. Performance budgets have a management orientation because they emphasize efficiency in performance, maximizing unit output per unit input of resources. The program budgeting format emphasizes effectiveness by relating expenditures to public goals through its organization by programs. It focuses on achievements, outcomes, or final products as a result of its planning orientation and links results to strategic planning goals. Financial resource management in local government can be enhanced by incorporating elements of these approaches where they help to focus on efficiency in the utilization of resources and effectiveness in accomplishing desired goals and objectives. Thus, the operations budget can become a planning tool that helps local government to achieve strategic planning goals.^[15-19]

Capital Budgeting and Debt Administration

Capital budgeting in local government emphasizes long-term capital facilities planning and programming. It differs from operations budgeting in focusing on long-term, non-recurring projects that are of high value and are financed from other than operating budget revenues, usually debt financing. The capital budgeting process depends on assessment and forecasting of community needs, evaluation and ranking of capital projects to address those needs over a period of time, and determination of the financial capacity of the community to pay for capital improvements. It results in a capital improvement program (CIP) for a 5- or 6-year period by scheduling capital projects in priority order over the period.

The first year of the 5- or 6-year CIP becomes the next year's capital budget.^[6,15,20]

Debt administration associated with capital financing requires establishing appropriate debt policy (in particular, no issuance of debt with a maturity longer than the useful life of the project). It also involves determining the structure and design of debt to be issued: type of security—general obligation bond debt backed by full faith and credit vs. limited liability revenue bond debt backed by revenue to be generated from the project; term to maturity of the bond—either term or serial with multiple maturities; and call provisions before maturity. The borrowing costs of bond issuance is affected by a local government's bond rating, an assessment of creditworthiness or risk to potential purchasers for a particular bond issue as determined by commercial rating firms. Because the marketing and long-term administration of bond debt is problematic for local governments, bonds are usually sold to an underwriting firm that purchases the entire issue and resells it at a profit to investors.^[6,15]

CONCLUSION

Financial resource management in local government is constrained by its environment, but nonetheless is a means for accomplishing strategic management. Through management control, the component functions of financial management enable goals and objectives from strategic planning to be linked to actual results. The component functions of financial management accomplish these ends through their emphasis on financial management's core values: control, performance (efficiency), and planning (effectiveness).

As a dynamic process, financial management in local government is continually changing. This is evident in the dramatic changes in accounting and financial reporting standards that will have significant impacts on local governments. It is evident in the increased emphasis on cost analysis to use resources more efficiently. It is also evident in the increased emphasis in operations budgeting on performance and program approaches to incorporate strategic planning to achieve planned results, and thus to enhance local government effectiveness and accountability. All these changes are further evidence of the continuing influence of the core values that component functions of financial management emphasize.

INTRODUCTION

General-purpose governments, governmental enterprises, and not-for-profit entities meet their public accountability requirements partly by preparing annual financial statements. Financial statements communicate the entity's financial position at the end of the year, for which the statements and the entity's operating results for the year then ended are prepared. The statements array the numerous day-to-day economic transactions and events in such a way that readers can make informed decisions about the entity and assess its accountability.

Financial statement analysis requires use of the statements, related notes, and auditor's opinion to develop information about the entity's liquidity and short-term financial position, operating results, and longer-term financial flexibility. For general-purpose governments, financial statement analysis also assists in assessing budgetary accountability. Financial statement analysis is also a part of the broader assessment of an entity's financial condition; that is, the likelihood that the entity will meet its future financial obligations to bondholders, employees, and stockholders as well as its service obligations to the citizenry.

Financial statement analysis requires conversion of financial data to more useful forms, primarily ratios. Effective analysis also requires using data for more than 1 yr as well as comparison with other entities (as a frame of reference for reaching conclusions about the entity studied). Many of the concepts and ratios discussed in this paper apply equally to general-purpose governments, governmental enterprises, and not-for-profit entities. Those that are unique to a specific type of entity are identified as such.

USERS AND USES OF FINANCIAL STATEMENT ANALYSIS

Persons both internal and external to a particular entity may analyze financial statements. (When prescribing financial reporting standards, accounting standards setters generally consider the needs of external users, because internal users have ready access to whatever information they need.) Users of financial statement analysis include a governmental entity's elected

and appointed officials; officials of oversight governments; managers and trustees of not-for-profit entities; donors and potential donors; citizens and citizen advocate groups; providers of goods and services, including employee unions; and financial resource providers and their representatives (e.g., banks, municipal credit-rating agencies, and insurers of municipal debt).

Financial statement analysis leads the user not only to assess financial position, results of operations, and accountability, but also to act on the information. For example, the analysis may lead managers or trustees to conclude that the data indicate a deteriorating financial position, causing them to act to shore up the entity's finances. These are some specific concerns an analyst might have when analyzing financial statements:

- To determine the likelihood of the entity's ability to pay its short-term obligations, such as tax anticipation notes and amounts due to vendors and employees.
- To determine the likelihood of the entity's ability to pay its long-term obligations, such as long-term bonds and pensions.
- To see if the entity's margin of revenues over expenses provides a sufficient cushion to weather economic downturns, finance certain expenditures, or meet contingencies.
- To ascertain the composition of an entity's revenues and expenses (e.g., the portion of revenues obtained from sales taxes or the portion of expenses used for program, rather than administrative, purposes).
- To determine what portion of an entity's resources may be used for general or unrestricted purposes, rather than being restricted for specific purposes by law or donor requirement.

INFORMATION CONTENT OF FINANCIAL STATEMENTS

Accounting standards setters have changed financial reporting requirements during the past few years. For example, new financial reporting standards require state and local governments to prepare a management discussion and analysis (MD&A) to precede the financial statements. The MD&A contains condensed

financial information that compares the current year with the previous year. The accompanying analysis of the government's financial position and results of operations helps financial statement users assess whether the entity's financial position improved or deteriorated as a result of the year's operations. The analysis also includes a discussion of significant variations between budgeted and actual amounts, as well as currently known reasons for variations that are expected to affect future services or liquidity. Important economic factors that significantly affected operating results for the year must also be discussed. Therefore, the MD&A provides a good starting point for analyzing a governmental entity's financial statements.

Regardless of the type of entity analyzed, the financial statements, the accompanying notes, and the auditor's opinion need to be read thoroughly. The formats and titles of financial statements prepared by governmental and not-for-profit entities (including not-for-profit hospitals) are somewhat different, but the kinds of data they convey are similar. This section contains a brief description of the contents of the various types of financial statements and the related notes.

Governmental and not-for-profit entities generally use fund accounting. Each fund is a separate fiscal and accounting entity, established for the purpose of carrying on specific activities in accordance with laws, regulations, and restrictions. Despite the use of funds for internal purposes, both governmental and not-for-profit financial reporting standards emphasize the entity as a whole, rather than individual funds or fund types. Government financial reporting standards require two levels of reporting, a government-wide level (which distinguishes between governmental and business-type activities) and a fund level (where the focus is on major funds). Not-for-profit entity reporting standards require reporting on the entity as a whole but permit entities also to provide data by fund type in external financial reports, if they want to do so. Within their entity-wide reporting, not-for-profit entities must report year-to-year changes in net assets by three net asset classes—unrestricted, temporarily restricted by donors, and permanently restricted by donors.

The most common financial statements prepared by governmental and not-for-profit entities fall into these general categories:

- Statement of financial position (or statement of net assets or balance sheet).
- Statement of operations (or statement of activities or statement of revenues, expenditures/expenses, and changes in fund balances).
- Cash flow statement.

In addition, depending on the circumstances, some not-for-profit entities may prepare a statement of

functional expenses and a statement of changes in net assets.

Statement of Financial Position

A statement of financial position provides information about an entity's assets, liabilities, and net assets at a point in time. When considered together with the notes to the financial statements, the statement of financial position helps the analyst assess liquidity and financial flexibility. Assets and liabilities appearing in the statement of financial position are arrayed generally in terms of liquidity, with assets shown in order of nearness to being converted to cash and liabilities shown in order of nearness to being paid. Assets and liabilities may be grouped, based on whether they are current or non-current. In that context, the term "current" generally refers to the expectation that the assets will be converted to cash or consumed in operations in the next year and that the liabilities will be paid off in the next year. (In governmental fund balance sheets, however, the term "current" connotes a shorter period of time.)

The net asset section of the statement of financial position—that is, the difference between assets and liabilities—is segregated as between unrestricted and restricted. (Use of resources in a governmental entity may be restricted by law or by creditors; use of resources in a not-for-profit entity may be restricted by donors.) Resources classified as unrestricted may be used for any purpose consistent with the entity's functions.

Statement of Operations

The statement of operations, when used with the related notes and other data, provides information to help users evaluate the entity's financial performance during a specified time period. It shows the composition of the various types of revenues and expenses and how revenues were used in providing programs or services. There are some differences in format and emphasis among financial statements prepared for governmental entities, not-for-profit entities in general, and not-for-profit hospitals.

Government-wide operating statements, prepared on the full accrual basis of accounting, show the relative financial burden each governmental function places on its taxpayers. The statements do this by reporting the expense of each function net of revenues (e.g., charges for services and operating grants from other governments) directly related to the function. Taxes, other general revenues, special items, and extraordinary items are then deducted from the sum of the net expenses of all the functions to show the change in

net assets for the year. (Special items, sometimes called “one-shots,” are transactions within the control of government that either are unusual in nature or do not occur frequently.) The change in net assets provides a measure of the extent to which the year’s revenues financed the services provided by the government.

Governments must also prepare operating statements for each major fund. There is likely to be more than one set of fund-level statements, because those statements are prepared on the modified accrual basis of accounting for governmental funds and the full accrual basis for proprietary funds. After considering the revenues, expenditures, other financing sources, and special items in the governmental fund statements, the result is the net change in fund balances. By definition, governmental fund accounting focuses on short-term revenues and expenditures; also, other financing sources may contain non-revenue inflows. Therefore, the analyst must use these statements with care.

The statement of activities prepared by not-for-profit entities shows the changes in net assets by net asset class (unrestricted, temporarily restricted, and permanently restricted) and in total. This statement shows major revenue sources (e.g., contributions, fees, and investment income) for each net asset class. Because reporting standards require that all expenses be reported in the unrestricted class of net assets, the amount of net assets released from restriction for use in operations is also shown. To help analysts to assess service efforts, not-for-profit entities report expenses by functional classification, such as major classes of program services and supporting activities. Not-for-profit entities classified as voluntary health and welfare organizations must report expenses both by major function and by natural classification (e.g., salary, rent, and utility expenses).

Not-for-profit hospitals follow the same reporting standards as other not-for-profit entities. Those concerned with hospital financial reporting, however, believe that it is important for hospitals to have a clear bottom line measuring financial performance. They, therefore, recommend using two activity statements, a statement of operations and a statement of changes in net assets. In the statement of operations, the caption “excess of revenues over expenses” provides the analyst with a performance indicator.

Cash Flow Statement

An entity could report an excess of revenues over expenses in the statement of operations because it uses the full accrual basis of accounting, yet experience financial difficulties because of a shortage of cash. The cash flow statement shows the factors that result

in cash inflows and outflows and provides a useful link to the other financial statements.

Notes to Financial Statements

Because the statements themselves do not provide a complete picture of financial position and results of operations, they are accompanied with notes. The notes are considered necessary for fair presentation and are an integral part of the financial statements. They provide details on such matters as significant accounting policies, contributions, restrictions, pension plans, contingencies, and financing arrangements. For example, note disclosures on the rate of amortization of long-term debt help in assessing an entity’s debt burden, and note disclosures on pensions help in assessing pension-funding status.

FINANCIAL STATEMENT ANALYSIS METHODOLOGY

Financial statement analysis requires use of time-series analysis and comparative analysis. It also requires conversion of financial and other data into forms that will facilitate time-series and comparative analyses, such as ratios, percentage change information, and common size analysis. There are limits, however, to what one can do with the individual bits of information derived from each aspect of the analysis. A few ratios may suffice for some purposes, for example, if the analyst wants to know only the present composition of the entity’s expenses. If the analyst wants to draw conclusions about the long-term financial viability of a governmental entity, however, many matters (including data outside the financial statements) must be examined. Financial statement analysis is an art, not a precise science.

Time Series Analysis and Comparative Analysis

Time-series analysis looks at changes within an entity over time to see if conditions have improved or deteriorated. Time-series analysis requires a minimum of 2 yr. In assessing a state or local government’s financial condition, time-series analysis covers a period of at least 5 yr. Time-series analysis allows one to draw conclusions about changes in an entity’s financial position and results of operations, but it suffers from the lack of an external reference point that allows one to assess the implications of the level of a particular statistic.

Comparative analysis provides that external reference point. Comparative analysis in this context means comparing an entity with a peer group of similar entities, credit-rating agency norms or medians, or

conclusions reached in research studies. Care must be taken in developing a reference group for comparison purposes, because data may be distorted by such factors as differences in mission, size, location, and mix of population served. Thus, a peer group might include hospitals of generally similar bed size that perform similar functions and, also, governments of roughly similar population that perform similar functions in the same state. For example, an analyst might compare financial data of a village with, say, 10 villages of roughly similar population in the same state.

Although having a reference point allows the analyst to draw inferences about an entity, using comparative data also has some limitations that need to be recognized. For example, if a peer group of similar entities suffers from the same problems experienced by the entity under study, the analyst may fail to recognize a particular weakness.

Conversion of Data to More Useful Forms

To make time-series and comparative data useful, financial statement data elements must be converted to more useful forms, such as ratios. Ratios are obtained by relating one financial statement data element to another or to an economic or demographic data element. By converting financial and other data to a ratio, you can gain insights not previously evident. Further, ratios make it possible to track data over time and to compare it with other entities. For example, when the numbers are considered separately, you cannot draw inferences from the fact that the financial statements show accounts receivable to be \$90,000 and revenues to be \$405,000. But, when those numbers are considered together and converted to ratios, you find that it takes an average of 81 days to collect the receivables. Comparing that number with last year's number of 75 days and an industry norm of 60 days allows the analyst to reach conclusions and raise appropriate questions.

A simple form of data conversion is calculating the percentage change from an earlier period to the current period. Another form of data conversion, the location quotient, is obtained by using the number for the entity under study as the numerator and the reference group number as the denominator. When used in time-series analysis, the location quotient readily reveals the direction of the data element for the entity under study relative to the reference group. Converting certain financial data to per capita information (e.g., to compute property tax revenues or education expenditures per resident) also facilitates comparison with a peer group.

Converting financial statements to "common size" facilitates financial statement analysis, because it results in conversion of numbers to percentages of

the whole. For example, if the total expenses of a not-for-profit entity are calculated as 100%, the amount reported for administrative and fund-raising expenses might be, say, 28% of the total. By itself, that percentage might not be meaningful. However, if that percentage was 24% last year and if similar not-for-profit entities report an average of 20%, the percentage change from last year and the location quotient relative to the peer group might cause the analyst to raise questions about the reasons for the disparities.

Some of the more common ratios developed in financial statement analysis are discussed in the ensuing paragraphs.

LIQUIDITY AND SHORT-TERM FINANCIAL POSITION RATIOS

Liquidity ratios (sometimes called short-term financial position or cash solvency ratios) provide information on an entity's ability to meet its short-term obligations, such as salaries, bills for supplies received, and payments on borrowings coming due in the near future. Paying short-term obligations in a timely manner requires the current availability of cash or the ability to convert other assets to cash in time to pay the bills.

The current and the quick ratios are the most commonly used liquidity ratios. The current ratio compares all current assets with current liabilities. The quick ratio compares cash and cash equivalents (and, sometimes, other current assets) with current liabilities.

Cash equivalents are included in the quick ratio because they are short-term, highly liquid investments, readily convertible to known amounts of cash, and are so close to maturity (having had an original maturity of 3 mo or less) that there is little risk of loss in value. Analysts may add other short-term, highly liquid investments and receivables when computing the quick ratio. General-purpose government analysts often do not do that, however, because current liabilities are generally due to be paid in 30 days, whereas investments and receivables may not be readily convertible to cash in time to pay bills. Some analysts use a quick ratio of 1.0 as a norm, but a ratio of less than 1.0 does not necessarily mean that the entity is illiquid.

$$\text{Current ratio} = \frac{\text{Current assets}}{\text{Current liabilities}}$$

$$\text{Quick ratio} = \frac{\text{Cash} + \text{Cash equivalents}^*}{\text{Current liabilities}}$$

*Sometimes, other current assets are added.

Another perspective on cash liquidity can be obtained by calculating the number of days' cash on hand. This ratio tells the analyst how long the entity can continue to pay its operating expenses without further cash inflows. It may also reveal that the entity has excessive cash, which might be better used to acquire new facilities and equipment.

Days' cash on hand:

$$\frac{\text{Cash} + \text{Cash equivalents} + \text{Short-term investments}}{\text{Cash needs per day}^*}$$

*Total operating expenses less bad debts and depreciation, divided by 365.

The speed with which receivables are converted to cash is a significant indicator of both liquidity and efficiency. The quicker the entity converts receivables to cash, the less cash and other assets it needs for paying current obligations and the quicker the excess cash can be converted to interest-earning assets. Analysts of general-purpose governments calculate a ratio of real property taxes receivable to tax revenues and a tax delinquency rate (or its inverse). Analysts of hospitals and some governmental enterprises often express receivables liquidity in the form of number of days' revenue in receivables.

Property tax receivables rate:

$$\frac{\text{Real property taxes receivable}}{\text{Real property tax revenues}}$$

Tax collection delinquency:^a

$$\frac{\text{Uncollected current year real property taxes}}{\text{Current year real property tax levy}}$$

Days' revenue in receivables (hospitals):

$$\frac{\text{Net patient accounts receivable}}{\text{Net patient service revenues}/365}$$

DEBT BURDEN AND LONG-TERM FINANCIAL FLEXIBILITY RATIOS

Debt burden and long-term financial flexibility ratios measure an entity's ability to meet its long-term financial and service obligations. These ratios help answer questions such as: Is the entity likely to have sufficient resources to pay its long-term debts, including bonded debt, pension obligations, and postemployment health-care obligations? Does it have the capacity

to issue new debt to meet its current and future capital needs?

General-Purpose Governments

The most common debt burden ratios for general-purpose governments relate the outstanding long-term debt to a base that measures the entity's capacity to pay the debt, such as population, full value of taxable real property, and personal income. When making these calculations, the amount used for long-term debt should include all of the government's tax-supported debt, including general obligation debt, lease-purchase debt, and debt incurred through specially created agencies. Analysts generally exclude self-supporting debt from the total debt. They also make a separate calculation of debt burden that includes a share of the "overlapping" debt from other governments that tax its citizens from the same tax base.

Debt burden:

$$\frac{\text{Long-term debt}}{\text{Population, or full value of taxable real property, or personal income}}$$

Closely related to the debt burden is the debt service burden—the portion of the total revenues required to pay annual debt service (interest and principal) on outstanding debt. Obviously, the greater the debt service burden, the less the amount of resources that is available for program services. Norms regarding debt service burden differ by types of government and the functions they perform. As a general rule, a debt service burden below 10% is considered "affordable" (in terms of competition among programs for resources) and a burden between 15% and 20% is considered "high." When assessing debt service burdens, you need to consider the rate of pay-down of debt principal, because an entity that amortizes its debt principal rapidly is likely to experience a higher debt service burden ratio than one that amortizes its debt principal slowly. Credit-rating agencies suggest that, on average, 25% of outstanding debt should be retired within 5 yr of the balance sheet date and 50% should be retired within 10 yr.

$$\text{Debt service burden} = \frac{\text{Total debt service}}{\text{Total revenues}}$$

Governmental Enterprises and Not-for-Profit Entities

Financial statement analysts of governmental enterprises and not-for-profit entities (including hospitals)

^aIn the inverse, the numerator is the amount of real property taxes collected in the year of the levy.

generally calculate leverage ratios, which relate debt to equity. The concept here is that the more leveraged the entity, the more difficult it will be to borrow to finance future capital needs. There are several ways to calculate the debt to equity ratio. The numerator is generally the total long-term debt, including the amount reported as current (due to be paid in the coming year.) The denominator is generally either the total assets or the net assets (total assets minus liabilities).

$$\text{Debt to equity ratio} = \frac{\text{Total long-term debt}}{\text{Total assets (or net assets)}}$$

Analysts focus on debt service coverage, that is, the number of times the total debt service is covered by the revenues or the number of times the interest on the debt is covered by the revenues. The greater the “coverage,” the more likely it is that the entity will be able to meet its debt service requirements.

Debt service coverage:

$$\frac{(\text{Revenues} - \text{Expenses}) + \text{Depreciation} + \text{Interest}}{\text{Principal payment} + \text{Interest expense}}$$

Times interest earned:

$$\frac{(\text{Revenues} - \text{Expenses}) + \text{Interest expense}}{\text{Interest expense}}$$

Pensions

If pensions are a significant element of an entity's expenses, the extent of the funding of the pension system often provides evidence of an entity's financial health. The most common measure of pension funding adequacy is the funded status—the ratio of pension assets to the pension obligation. This is a required disclosure in government financial reporting. If the funded status is not available, pension payout coverage (ratio of pension assets to pension benefit expenditures) provides a useful measure.

Funded ratio:

$$\frac{\text{Pension fund assets available for benefits}}{\text{Pension benefit obligation}}$$

Pension payout coverage:

$$\frac{\text{Pension fund assets available for benefits}}{\text{Pension benefit paid last year}}$$

OPERATING RESULTS RATIOS

Ratios that depict operating results are sometimes called budgetary solvency ratios or profitability ratios. The most common operating results ratio is similar to the return-on-sales ratio found in business enterprise. Although neither governments nor not-for-profit entities operate for the purpose of making profit, breaking even or generating at least some surplus for the year is considered a positive indicator.

Depending on the format of the operating statement, the names of the numerator and the denominator may be somewhat different for the various types of entities. For example, the numerator may be the excess of revenues over expenses, the increase in net assets, or the increase in unrestricted net assets. The denominator may be the total revenues and other financing sources or the total revenues, gains, and other support. In any event, the governmental analyst, in particular, must take care to eliminate (or separately consider) “one-shot” resource inflows from borrowings, unusual financing arrangements, or other special items, so as not to distort the operating results for a particular year.

Operating surplus or operating margin:

$$\frac{\text{Excess of revenues over expenses (or expenditures)}}{\text{Total revenues, gains, and other support}^*}$$

*Or total revenues and other financing sources.

Those who analyze state and local government financial statements are particularly concerned with cumulative results of operations and the resulting fund balance. This is because fund balance provides a cushion against future budgetary problems caused by economic contraction or emergency expenditure needs. A general rule is that unreserved fund balance of 5–10% of revenues is sufficient to cover most contingencies. The budget cushion of entities whose tax revenues tend to be economy sensitive (such as income and sales taxes) should be at the higher end of the range.

$$\text{Budget cushion} = \frac{\text{Total unreserved fund balance}}{\text{Total revenues}}$$

In addition to the overall operating results, those who analyze governmental financial statements focus on trends in the composition of revenues and expenditures. This is because increases in tax rates for a particular revenue source may weaken the ability of the entity to raise rates in the future. Increases in certain expenditures may indicate particular social and economic problems that need to be addressed.

Those who analyze not-for-profit entity statements may be interested in the portion of the entity's resources that is spent on program activities vs. non-program

activities, such as administrative and fund-raising expenses.

$$\text{Program service ratio} = \frac{\text{Program expenses}}{\text{Total expenses}}$$

ASSESSING GOVERNMENTAL FINANCIAL CONDITION

Financial statement analysis provides insight into an entity's current financial position and results of operations. For a longer-term perspective on an entity's financial health, however, the analyst needs to look beyond the financial statements. Going beyond the financial statements takes the analyst into what some call financial condition analysis.

The ability of a governmental entity to finance future expenditures arising out of previous commitments depends heavily on the strength of its economy. It, therefore, requires the analyst to consider not only the analysis of financial statements but also the trends in economic and demographic data. For example, the financial condition analyst is concerned with the growth in property, sales, and income tax bases, caused by such factors as new residential and commercial construction and the employment base. The financial

condition analyst is also concerned with population size and composition, personal income, poverty rates, full value of taxable real property, unemployment rates, employment totals and composition by industry sector, and employer diversity.

Much of the economic and demographic data needed for financial condition analysis may be found at websites maintained by the U.S. Bureau of the Census, the U.S. Bureau of Economic Analysis, and the U.S. Bureau of Labor Statistics. Some of the data may be found in the statistical sections of governmental comprehensive annual financial reports.

Fiscal Distress of Local Governments in Israel

Abraham Carmeli

Graduate School of Business Administration, Bar-Ilan University,
Ramat-Gan, Israel

INTRODUCTION

Fiscal and financial distress of local governments is a worldwide phenomenon. This phenomenon has been a key subject of inquiry, one that has attracted great interest to all local government stakeholders (academic researchers, practitioners, state and local government organizations, suppliers, media, and the public, among others) due to its significant implications on the political, social, and economic state of affairs. The present entry provides an overview of this phenomenon, with a particular emphasis on the fiscal distress of local governments in Israel.

FISCAL DISTRESS OF LOCAL GOVERNMENTS

Fiscal distress of local governments is a major public problem that affects the economic, social, and political well-being of both individuals and organizations. Facing localities' fiscal distress is of great concern, because it may reach the point of overall system collapse. This phenomenon occurs in the more liberal economically oriented countries (e.g., the United States) as well as the more welfare-oriented countries (e.g., Norway).

Over the years, many local governments have experienced fundamental fiscal difficulties: New York City in 1970; Philadelphia in 1990; Orange County in 1994; Bridgeport, which became the largest city at the time to file for bankruptcy; Miami in the 1990s; and Glasgow in the second half of the 1990s.^[1] This has also been the case with local governments in Britain, the Netherlands in the 1980s, Germany in the 1990s, and Japan in the second half of the 1990s. Many of the local governments in Israel have also experienced and, in some cases, are still experiencing fiscal distress. Research suggests that this is an ongoing acute problem.^[2] Various indicators, as explained below, are evident for ongoing fiscal and financial distress. The key problem is that the local government experiences considerable difficulties in raising sufficient revenues to cover its legally required expenditures, which often creates a structural public problem.

FISCAL DISTRESS AND CRISIS—DEFINED

Scholars and practitioners use various terms such as *fiscal distress*, *fiscal crisis*, and *financial crisis* to describe a situation in which local governments have difficulties meeting fiscal and financial needs.

"Fiscal distress" has been defined in various related ways and generally refers to both short- and long-term difficulties. Bradbury was a pioneer in suggesting a categorization by which fiscal distress can be quantified.^[3] She distinguished between *budgetary fiscal distress* and *citizen fiscal distress*. "Budgetary fiscal distress" occurs when local authorities encounter difficulties in balancing their budget, while "citizen fiscal distress" occurs when citizens are imposed upon to pay exorbitant taxes and fees for the municipal services they are provided with or when local authorities provide a low level of municipal services compared to other local authorities in similar situations.^[3]

A similar approach for defining financial conditions was suggested by Groves and Valente.^[4] These authors distinguished between *budgetary solvency* and *service-level solvency*. "Budgetary solvency" refers to the government's capacity to generate enough revenues over its normal budgetary period to meet its expenditures and not incur deficits, while "service-level solvency" refers to the government's ability to provide a community's desired services at the level and quality that are required for the health, safety, and welfare of that community.^[4] In addition, Inman refers to "fiscal crisis" as that which "occurs when a city's potential to raise revenues is insufficient to cover the city's legally required expenditures" (on page 378 of Ref.^[5]).

ASSESSING THE FISCAL DISTRESS OF ISRAEL'S LOCAL GOVERNMENTS

The Financial Structure of the Local Government

Local government activities in Israel are financed by two major sources: the regular (ongoing or current) budget and the non-regular (one-time or development) budget. The regular budget is financed by self-incomes (revenues collected directly from residents

and businesses, such as property taxes and development levies), transferred revenues (portions of taxes that are basically owned by the local government but collected by the central government and transferred to local authorities), general grants (transferred by the Ministry of the Interior in order to ensure sufficient resources, so that local authorities can deliver an acceptable municipal services basket), and specific grants (transferred by the central government to finance state-related services, particularly education and welfare).^[6] The regular budget should finance current expenses such as salaries, operational activities, and loan payments. The non-regular budget is financed by non-regular incomes, which typically are not drawn from the same sources such as development fees, improvement fees, donations, and loans (e.g., Ref.^[6]), but are ad hoc in nature. The non-regular budget should finance the more costly infrastructures such as water, transport roads, lighting, and drainage, namely developmental programs. These two sources are an indication of a local authority's fiscal and financial health. The higher the self-income ratio is to the regular budget, the stronger a local authority is fiscally. In addition, a high self-income ratio is an indication of a local authority's level of autonomy.^[7]

The fiscal state of the local government

A report of the Department of Economics affiliated with the Israel Union of Local Authorities, published on August 18, 2003, indicates that 109 LGAs experienced problems paying their employees' provident fund and continuing education fund; 128 localities still have not yet paid their taxes to the authorities; in 24 localities, monthly salaries have not been paid at all; and, in an additional 19 localities, monthly salaries were only partially paid. To learn more about the budgetary conditions of the local government, we referred to all localities in Israel, using aggregated data.

The current deficit of the entire local government was 655,217,000 and 1,278,094,000 NIS or 2.2% and 4.2% in 2000 and 2001, respectively. The accumulated deficit of the entire local government was 4,518,236,000 and 4,970,345,000 NIS or 15.5% and 16.3% in 2000 and 2001. These findings are subject to one's point of view regarding the desirable scope of deficit. Yet, these results also indicate that the local government as a whole experiences considerable difficulties in raising sufficient revenues to cover its legally required expenditures. Consistent with Inman's view (on page 378 of Ref.^[5]), Israel's local governments have been experiencing a fiscal crisis.

A review of the financial reports of the local government in Israel for 2003, as provided by the Ministry of the Interior report, suggests that the situation has not improved. The assessment of the fiscal conditions

of Israel's local government was conducted by implementing various measures. We first assessed fiscal solvency. To measure short-term fiscal solvency, we used two measures: current ratio and self-income ratio. We first measured the *current ratio*, which is defined as the ratio between the total amount of current assets (excluding investments, investments for covering budgeted funds, accumulated deficit in the regular budget, and temporary net deficits in the non-regular budget) and the total amount of current obligations (excluding development funds, budgeted funds, accumulated surplus in the regular budget, and temporary net surplus in the non-regular budget). The total amount of current assets consists of all the current properties for the short run (up to 1 yr), such as customers, bank remainders, investments, and other debtors. The total amount of current obligations consists of all the current debts for the short run (up to 1 yr), such as suppliers and budgeted funds. The data showed that the current ratio ranged from a minimum of 0.02 to a maximum of 4.77, with a relatively poor average of 0.38 (SD = 0.50).

To further assess short-term fiscal solvency, we calculated the *self-income ratio*, which is defined as the ratio between all the self-income and the overall income of the regular budget. Self-income consists of all the income (taxes, grants, and fees) that the local authority directly collects from the inhabitants, businesses, and other assets within its jurisdiction. Regular budget income consists of property taxes, fees, surcharges, general grants, finances from ministries, and individual sources of income. The closer the ratio is to 1, the better the financial state of the local authority. The data indicated that the self-income ratio ranged from a minimum of 0.06 to a maximum of 0.93, with an average of 0.48 (SD = 0.20). Although we used this to measure short-term fiscal solvency, it should be noted that this also reflects the fiscal independence of local authorities, which, according to the data, is poor.

Following Bradbury's suggestion to assess budgetary fiscal distress by analyzing the extent to which local authorities encounter difficulties in balancing their budgets, we calculated the *income-to-expenditures ratio*, which is defined as the ratio between the total amount of income and the total amount of expenditures in the regular (current) budget.^[3] Regular budget income consists of property taxes, fees, surcharges, general grants, finances from ministries, and single sources of income. The total amount of expenditures in the regular budget consists of general administrative services, local services, state services, enterprises, and other expenses. The data indicated a ratio that ranged from -1.04 to 0.05, with an average of -0.11 (SD = 0.13), and found that 78.9% of the local authorities had a deficit in their regular budget and only 4.9% percent had a (minor) surplus in the regular budget.

Finally, we assessed the long-term fiscal condition by calculating the ratio between the socioeconomic level of the population in local authorities and the self-income ratio. The socioeconomic level is a measure provided by the Israel Central Bureau of Statistics, which ranks the local authorities on a 10-point scale ranging from 1 = very poor to 10 = very strong. Results of a bivariate correlation indicate a strong correlation ($r = 0.77$, $p < 0.001$). This indicates that the tax burden is already too high and that citizens do not have the economic means to fund the budgetary deficits.

SOURCES OF FISCAL DISTRESS IN ISRAEL'S LOCAL GOVERNMENTS

There are various sources for the fiscal distress of local governments in Israel (Carmeli, 2007). Below, we have summarized some of the fundamental causes of these difficulties.

Local Authorities' Size

The *size* of a local authority is considered an important factor, as it may have a significant impact on its performance. A local authority can be measured by the number of permanent residents within its jurisdiction and/or the value of the municipal budget. It may be argued that smaller local authorities are unable to reach optimal levels of economic efficiency because of their limited resources and complex challenges. Razin's study indicated that larger localities enjoy better fiscal health than smaller localities.^[8] Findings of data from the financial reports of the local governments in Israel for 2003 indicate that larger local authorities enjoy better fiscal health than smaller local authorities. However, the correlation, although significant, is small.

Location

The *location* of a locality influences its ability to attract new businesses and a strong population. In Israel, about 80% of the population is concentrated within the triangle along the coast and inland toward Jerusalem, which accounts for slightly more than 20% of the country.^[9] Localities located along the periphery put the blame on the central government for its continuous neglect in developing infrastructures that would connect the periphery with the center.

Residents' Socioeconomic Status

The financial sources of municipal services (e.g., sanitation, recreation, and road maintenance) provided

by a local authority are derived from municipal taxes the latter collects from the permanent residents and businesses within its jurisdiction. Clearly, a locality with an inferior socioeconomic resident status encounters difficulty in raising the amount of revenue required for providing satisfactory municipal services. We found a strong correlation between residents' *socioeconomic status* and the self-income ratio ($r = 0.77$, $p < 0.001$). This confirms the above argument that a locality with an inferior socioeconomic resident status is limited in its ability to raise satisfactory revenues, be fiscally independent, and provide the expected level of municipal services.

Governmental Resource Allocation

The way the central government allocates its resources affects the capacity of a locality to provide satisfactory state-level services. Local government leaders make the argument that many local authorities are in a financial crisis due to their task burden and lack of resources. This position is held by several scholars who have investigated the resource allocation issue.^[10] In a policy paper, for instance, presented by Ephraim Torgovnik at the First Annual Local Government Conference held by the Harold Hartog School of Government and Policy at Tel Aviv University (2005), it was indicated that the extensive budgetary cut in central government aid for expenditures that had already been committed to services such as education had resulted in acute fiscal distress, and, even though this cut was later cancelled, the Ministries of Finance and the Interior allocated only 1.5 billion NIS for local authorities that would enter a recovery program. This, along with the fact that there are no clear and explicit definitions of whether the state-level services are state, municipal (local), or both postpolicy and implementation difficulties in allocating resources efficiently.^[10]

Transparency

Transparency is essential for improving the performance of local governments. Transparency should cover everything the organization does or does not do and the reasons behind the actions. This includes input, processes, output, and outcomes. In a policy paper, "Transparency in Local Government," presented at the First Annual Local Government Conference held by Harold Hartog School of Government and Policy at Tel Aviv University (2005), Amichai Ben Dror, Yossi Gross, Doron Navot, and Susan Tam noted that there was sufficient evidence to support the claim that there were patterns of corruption in a significant number of local authorities and that

institutional reform aimed at increasing *inter alia* transparency was needed. Improper management in organizations, whether intentional or unintentional, is a serious problem not only in public sector organizations but also in not-for-profit and for-profit organizations. Transparency facilitates a comparison among the local authorities and drives localities to perform in a better and more responsible way.

Performance Measurement

Although scholars and practitioners recognize the need to assess and measure how well local governments perform, there is no systematic evaluation mechanism through which stakeholders can assess the performance of localities in Israel. Stakeholders cannot make rational decisions without clear and detailed performance reports; however, even more importantly, one may question how local authorities make their decisions without a fundamental evaluation system.

A notable attempt to change this situation was led by the Committee for Implementing Changes in Financial Reporting of Local Authorities (Ministry of the Interior, 1999) to recommend 10 performance criteria that a local authority would be required to include in its financial report (as a management report). These criteria are concerned with 1) the total expenditure for education, sanitation, and infrastructures; 2) generated revenues such as property taxes; 3) changes in internal immigration; and 4) financial performance such as accumulated deficit and deficit per resident. Yet, this is not a comprehensive performance evaluation system and, at best, may be considered as an initial step in the right direction. Suffice it to say, much has yet to be done in this direction.

Management of Local Authorities

One of the major arguments, expressed mainly by the central government, claims that general mismanagement of the local authorities is the main source of their financial difficulties. In his response to local government heads' threats to strike and stop providing municipal services, Nehemia Strasler, a journalist who has been extensively covering the economic situation in Israel, said:

The truth is that even without the last cutback of the balance grants, the local government authorities would have gone on strike, because of their chronic deficits, derived from their continual failure in the management of their organizations. There is not one year in which they have avoided a strike, there is not one year in which they have not committed themselves to execute recovery plans, and yet they continue to implement

the same type of mismanagement that brings them down. A good local authority head is not one who keeps the budget balanced. On the contrary; as long as the (local authority head) pays for and showcases good objectives, as long as she/he provides employment for close associates, she/he would be considered as the better local authority head, regardless of deficits.

—Haaretz (February 2, 2004)

Managing a locality is a very complex task. Although we have witnessed certain improvements, it remains a major problem that affects the capacity of localities to enhance their fiscal health.

Relationships Between the Central and Local Governments

Although the local government operates closely with the central government, this relationship has still not become sufficiently institutionalized. This results in difficulties when attempting to divide responsibilities (who is responsible and accountable for what?) and causes a lack of coordination between the governments. Solving the fiscal crisis of the local government—a mutual interest—may be achieved by redefining the responsibilities for the services and resources required to build a healthy system. The fiscal crisis of the local government affects a wide range of related issues such as education, crime control, and job creation, among others. Neither the central government nor the local government wishes to be perceived as entities that do not deliver public value. Paradoxically, the fiscal state of affairs not only is affected by the problematic relationships between the local and central governments but also acts as a catalyst driving them both to resolve the framework of their responsibilities and to improve their level of coordination.

Differences Between Jewish and non-Jewish Localities

There is a substantial body of evidence suggesting that local authorities in which the majority of the residents are Jewish (hereafter “Jewish localities”) are in superior fiscal health compared to local authorities in which the majority of the residents are non-Jewish (Arab and Druze) (hereafter “non-Jewish localities”). For example, Carmeli examined a sample of 98 localities, which is a representative sample of the local government in Israel, and found that the correlation between sectors (1 = Jewish and 0 = non-Jewish) was relatively large and significant ($r = 0.44$, $p < 0.001$).^[11] One clearly should take into account differences between these types of localities when analyzing the fiscal distress/health of the local government

in Israel. Clearly, these differences are a complex issue and require particular and intensive attention in order to understand its sources, consequences, and changes over the years.^[12]

CONCLUSIONS

The fiscal distress of the local government in Israel is a complex phenomenon that may be seen, on the one hand, as part of a wider, international phenomenon, as well as a case that has some idiosyncratic characteristics on the other. The current entry has highlighted some of the key issues with which the local government has been coping over the years. Some of these issues are structural (i.e., require substantial restructuring), while others call for special and focused strategies. Hence, both macro- and microlevel issues need the attention of policymakers, in order to improve the fiscal conditions of the local government in Israel.

Fiscal Federalism

William Duncombe

Department of Public Administration, Syracuse University, Syracuse, New York, U.S.A.

INTRODUCTION

Fiscal federalism describes the division of fiscal resources and responsibilities among levels of government. Fiscal federalism is not just confined to countries with a federalist form of government, but can exist in any country where both central and local governments are assigned power over resource allocation and revenue-raising decisions.^[1] A brief review of theories and research on fiscal federalism is first presented. Then the concepts of fiscal federalism are discussed, by examining some recent changes in intergovernmental fiscal relations in the United States.

THEORIES OF FISCAL FEDERALISM

Theories of fiscal federalism develop a framework for deciding which level of government should provide a particular government service, with which sources of revenue, and what fiscal relationships should exist between them. Public finance economists, who have written extensively on this topic, emphasize that economic criteria, such as allocative and productive efficiency, should be used in making these decisions.^[2] Allocative efficiency refers to matching the type and level of government service provision with the demands of citizens, and productive efficiency is achieved when the maximum output is produced for a given budget.

Assignment of Functions

In his seminal work on fiscal federalism, Wallace Oates offered a convincing case for division of service responsibilities across levels of government.^[1] His framework for assignment of functions is based on the assumption that people and resources can flow freely across borders of local governments, but not across national boundaries. The economic functions of government can be divided into three major categories—stabilization, distribution, and allocation. Each function entails responsibilities, which may be best administered at a particular level of government.

Stabilization involves using monetary and fiscal policies to maintain employment, economic growth, and price stability. Macroeconomic functions of

government are best performed at the federal level, in part, because of the need for central control of the banking system and money supply. Also, the mobility of resources across local government borders greatly weakens the influence that any particular local government can have in the short run on economic growth within its borders.

Distribution describes the role government can play in assuring a socially desired distribution of resources across individuals within a country. It is generally argued that redistributive programs are best implemented by central governments, with a supplemental role for regional governments, such as states and provinces. Mobility across local government borders limits the ability of local governments to offer significantly better social services than neighboring governments. Evidence suggests that recipients of these services are mobile and will move to locations where services are better.^[3] Turning these social services over exclusively to local governments may promote a “race to the bottom” as local governments lower social services to encourage low-income households to move to a different community.^[4]

Allocation and production of socially desired goods and services remains the principal role of government. According to Oates’ *correspondence principle* the size of the government providing a service should be the smallest government, which includes all the beneficiaries of the service.^[1] National government should provide only those services, such as defense, immigration, and national transportation systems, that benefit a national constituency. Regional governments should specialize in services that have significant benefits extending beyond local boundaries, such as pollution control, corrections, and higher education. The remaining services should be decentralized to the local government level.

Local governments, by representing a smaller constituency, can best match government services to local citizen preferences, improving allocative efficiency. In addition, monitoring government performance is easier for citizens in smaller governments, which should also lead to improved productive efficiency. These efficiency benefits of smaller governments must be balanced against the potential cost savings from economies of scale for certain types of services, and the additional costs of running a number of smaller governments.^[1]

The efficiency advantages of decentralization could be enhanced by competition among local governments as households “vote with their feet” by choosing local governments with the best tax and service package.^[5] However, interjurisdictional competition over tax rates and services levels may lead to an underprovision of some public services.^[3] In an attempt to attract business, local governments may cut taxes and services not valued by business to levels below that desired by citizens in the community. The efficiency impact of competition may depend in part on whether the government is attempting to attract business or mobile households looking for the optimal mix of taxes and services.

Assignment of Taxes

An equally important part of an intergovernmental fiscal system is deciding which taxes are best suited for use at national and subnational levels of government.^[3] Key tax criteria include minimizing efficiency losses from the tax and enhancing vertical equity. In general, the larger the private sector response to avoid the tax, the larger the efficiency loss. Enhancing vertical equity involves designing tax systems that impose tax burdens on individuals in line with their ability to pay. In particular, we want to generally avoid regressive taxes, where taxes as a percent of income are higher for low-income households than high-income households.

Assuming mobility of resources within a country, subnational governments will have difficulty using progressive taxes. Any attempt to impose higher tax rates on upper-income individuals or owners of businesses could lead them to relocate to a local government with a more favorable tax climate. This mobility will increase the efficiency losses of the tax and reduce potential revenues. Instead, an ideal local tax system from an efficiency standpoint would involve the use of either user charges for services rendered, or taxes on relatively immobile tax bases.^[2] The most obvious example of the latter would be a property tax on unimproved land, which is completely immobile. Although property taxes and user charges may create relatively small efficiency losses, they are generally considered to be regressive and slow-growing sources of revenue.

The potential regressivity and inelasticity of local taxes suggests the need for the national government (and to a lesser degree, states and provinces) to use progressive taxes, which are responsive to economic growth. Income taxes, in particular, match these criteria, because they are tied directly to personal income changes, and they can be implemented with a progressive tax rate structure. General sales taxes are also responsive to economic changes, but can be regressive

unless necessities, such as food and clothing, are removed from the tax base.

Intergovernmental Aid

Intergovernmental grants represent a key tool in the design of an intergovernmental fiscal system. The most efficient division of functions across governments may involve assigning many of the most important and costly functions to subnational governments. Yet, optimal tax policy indicates that some of the largest and fastest-growing revenue sources should be at the national or regional level. The “vertical imbalance” between central revenues and local expenditures can be addressed through the distribution of revenues from the central government to local governments in the form of intergovernmental grants. Besides resolving the “vertical imbalance problem,” intergovernmental grants can be used by the central government to encourage local governments to increase their provision of services that have benefits beyond the boundaries of the local government.^[6] For example, local governments are often responsible for environmental infrastructure, such as waste treatment plants and solid-waste disposal facilities. Because the effects of water pollution will literally flow outside the boundaries of the local government, central governments can encourage local governments to improve waste treatment by providing grants. In addition, grants can be used to adjust for differences between local governments in their ability of finance public services. The largest grant programs in most state governments in the United States are to local school districts, and are used in part to equalize the fiscal capacity of these districts to finance education services.

The design of intergovernmental aid systems involves decisions over several dimensions. First, should the grant be targeted to the provision of specific services or resources, commonly called categorical grants, or should unconditional grants be provided to supplement general revenues (also called revenue sharing)? Another choice is whether the grant should be a lump-sum transfer of resources to a local government or in the form of a price change. By agreeing to match local contributions in the form of a matching grant, central governments can effectively lower the price for local governments to provide particular services. A third design decision is whether the grant is distributed by a predetermined formula (formula aid) or requires the local government to formally apply to receive funds (project grants).

Ideally, grant design should match the objectives of the grant. If the grant is to be used primarily to stimulate an increase in local spending on a particular service, then the grant should generally be a categorical

open-ended matching grant. Whether the grant should be distributed by formula or through a project application depends on the complexity of the service being provided, and whether there are concerns about local capacity to use the funds effectively. If the grant is going to be used primarily to correct for horizontal inequities across governments, then a non-categorical, lump-sum formula grant is preferred, with the formula carefully designed to adjust for differences in fiscal capacity and costs across local governments.^[7] If the grant is being used primarily to compensate local governments for using smaller, less elastic revenue sources, then non-categorical grants distributed roughly in proportion to the central government revenue collected in the local government might be justified. General revenue sharing (GRS), passed in 1972 under the Nixon Administration, was the only major attempt by the U.S. federal government to develop a general grant to address vertical imbalance problems. General revenue sharing was eliminated in 1986 by another Republican president, Ronald Reagan.

FISCAL FEDERALISM IN THE UNITED STATES

Recent Trends

In general, the intergovernmental fiscal system described above closely mirrors the division of fiscal responsibilities in the United States. The empirical evidence suggests that, for many government functions, fiscal federalism and the correspondence principle seem to be operative. Local governments, for example, tend to provide goods and services, such as public safety, housing, and recreation whose benefits are somewhat limited by jurisdictional boundaries. However, several of the major services provided by local government, particularly education, wastewater treatment, and solid waste extend beyond local borders. State governments are involved with goods benefiting larger groups of individuals, such as transportation, corrections, and higher education. Contrary to the theory, states are major providers of distributive programs in social services and health. The federal government is clearly responsible for national public goods, such as defense and foreign affairs, and has funded major social and income support programs in the past (Table 1).

In terms of assignment of revenues, the general pattern across levels of governments also fits recommendations. The federal government generally taxes the most mobile and elastic sources of revenue—corporate and personal income. Given that corporations are often mobile across state boundaries, the federal government should be the principal user of this tax. The federal government also receives significant revenue in the

Table 1 Government expenditures by function in the United States by level of government, 1992 (percent of total expenditures)

form of payroll taxes for social insurance programs (social security). State governments rely most heavily on personal income and sales taxes. For both types of taxes, mobility across borders could be a problem, but only for residents and consumers living near state borders. As recommended by theory, local governments are heavy users of property taxes and user charges and fees (Table 2).

Table 2 Major revenue sources in the United States by level of government, 1996 (percent of total revenue)

Revenue source	Total	Federal	State	Local
Intergovernmental revenue	14.8	0.2	22.9	33.7

The general trend in fiscal federalism in the United States is toward increasing state and local government reliance on federal grants. Since the 1970s, total federal aid has represented roughly 3% of gross domestic product, and has grown from 5.3% of total federal outlays in 1955 to 16% in 2000 (Table 3). From 1950 to 2000, federal grants as a percentage of state-local revenues increased from 13.7% to nearly 30%. State-local reliance on federal aid peaked in 1980, when federal aid represented close to 40% of state-local revenue. Although federal aid to states and local governments declined in the early 1980s, by the early 1990s, its importance to state and local revenues began to increase again. Despite several attempts by Republican presidents to increase the use of block grants since the 1970s, categorical grants continue to dominate federal aid. In 1995, estimates suggest that nearly 90% of all federal aid to states and local governments took the form of categorical grants (Table 4).

Table 5 provides information on the changing functional composition of federal grants since 1965. Transportation-related grants have decreased in importance, whereas health related grants—Medicaid, in particular—have increased dramatically as a percent of total federal aid. Postwar federal investments in the national interstate highway system represented significant portions of federal aid prior to 1965, but they have diminished as the system nears completion. Transportation grants dropped from 38% of federal aid in 1965 to 15% in 2000. Despite federal funding increases for environmental infrastructure in the 1970s, federal investments in state and local infrastructure have plainly lost ground to other priorities.

Table 3 Trends in federal grants to state and local governments in the United States

Year	Federal grants as a percent of		
	State-local revenues	Federal outlays	Gross domestic product
1950	13.7	5.3	0.8
1955	13.1	4.7	0.8
1960	19.1	7.6	1.4
1965	20.4	9.2	1.6
1970	26.3	12.3	2.4
1975	33.7	15.0	3.2
1980	38.3	15.5	3.3
1985	27.9	11.2	2.6
1990	25.0	10.8	2.4
1995	31.0	14.8	3.1

In inflation-adjusted dollars, federal spending on state and local environmental infrastructure dropped from \$6.5 billion in 1980 to \$2 billion by 1996.^[8] In contrast, federal grants devoted to health, income security, and employment and training increased from 48% of total federal aid in 1965 to 75% in 2000. Clearly, the distributive function of the federal government is crucially important in the current intergovernmental fiscal system.

Devolution and Block Grants

The most important current reforms in fiscal federalism involve the incorporation of more flexible, block grant-style federal aid mechanisms, with increased “devolution” of program responsibility to state governments. The bulk of federal aid, as well as the focus of most reforms, was that portion of the social safety net that was jointly financed by federal and state governments, namely Aid for Families with Dependent Children and Medicaid. In 1996, President Clinton signed the Personal Responsibility and Work Opportunity Reconciliation Act (PRWOR), which includes substantial reforms for federal and jointly funded income support programs. A critical component of the reform is a shift from an open-ended matching formula to a block grant for Temporary Aid for Needy Families (TANF), which replaces the 30-year-old AFDC program. Under the new law, the federal block grants require states to impose strict time limits for individual TANF benefits, as well as stringent work requirements.^[8]

The official justification for moving to state block grants has traditionally been to provide states with more flexibility in designing and administering their programs. Locating income support programs in the states may improve program design and efficiency

through state experimentation. In addition, there may be allocative efficiency gains associated with enabling citizen preferences to be more closely reflected in state spending decisions. Whether the potential efficiency gains from state administration of welfare programs will materialize is an area of substantial debate.^[3] However, block grants have also commonly been used to cut federal aid to states.

These reforms constitute fundamental shifts in the design of federal aid to support the social safety net and will undoubtedly have a significant impact on the spending behavior of states. Devolving redistributive social programs from the federal government to state governments runs counter to theories of fiscal federalism that suggest such programs should be operated at the national level. Because PRWOR eliminates the price subsidy offered through the matching grant formula, state spending in this area could drop substantially in the coming years.^[4] Spending decreases on welfare programs could be exacerbated by competitive pressure between states to keep tax rates low by cutting social services.

The actions of the federal government in the United States to devolve functions to state and local governments pose several challenges to conventional theories of fiscal federalism. The federal government has drastically cut back funding for state and local environmental infrastructure even though the benefits from these facilities clearly extend beyond state and local borders. The devolution of key programs in the social safety net to state governments risks competition among subnational governments that could lead to

an underprovision of these services. It seems inevitable that state and local governments will come under intensified fiscal pressures as the economy slows down over the next decade. The ability of these subnational governments to maintain their core infrastructure and the social safety net with diminished federal support will indicate whether it is time to write a new chapter in fiscal federalism.

Fiscal Transparency

A. Premchand

Consultant, Irvine, California, U.S.A.

INTRODUCTION

The content of fiscal transparency has evolved over years. The cumulative developments in this area are expected to provide an overview on the wisdom, faithfulness, and economy in the use of resources, in the provision of services, and in securing macroeconomic stability. Despite the efforts of international financial institutions to strengthen fiscal transparency, about one-third of the world's population does not have full access to information on the fiscal operations of public bodies. More efforts are indicated to expand the scope of fiscal information and to establish bodies of oversight. What remains to be achieved is significant and urgent.

HISTORY OF FISCAL TRANSPARENCY

The contours of fiscal transparency and its content were shaped over the years by two distinct trends—a desire to make the public officials accountable for their actions, and the political arithmetic of the times reflecting the concerns of the financial class and their interest in investing money in instruments of indebtedness. The evolution of fiscal transparency to date can be analyzed in terms of five stylized stages. During the first stage, the concerns of financial accountability of the monarchs and the concerns of an active society seeking a role in the utilization of public money—a feature associated with the Athenian state in the pre-Christian era—dominated the fiscal scene. The concern of the king was the preservation of the wealth of his own domain, and this required him to devise ways and penalties that would have the effect of preventing his officials from stealing. Writing more than 2000 years ago, a prime minister of a small North Indian kingdom cautioned his king to “Look well to the Treasury, for it is the key to all.” Variants of these approaches were followed in China, and this subsequently became the main feature of the Cameralist school associated with European kingdoms during the Middle Ages. The emphasis in a monarchy was on transparency that was intended for only one person, viz. King, and his audit agency. The concerns were the same in the development of the Athenian state, where there was explicit recognition, amongst others, by Aristotle, of the risks

associated with handling of large sums of money by officials and the need for systematic accounts that would illumine the whole area.^[1,2]

In the second stage, there emerged an investing class, and the political and financial arithmetic associated with their investments in government during seventeenth-century England had an impact on the content of fiscal transparency. A continuous engagement in wars depleted the British Treasury and made it dependent on private sources of financing raised through borrowing. The investing class was, however, keen to have detailed accounts of fiscal transactions of the government so that the financial health of the government could be ascertained. As these accounts were not forthcoming, the investors resorted to the appointment of their own staff to undertake independent compilation of accounts. In due course, however, this had the effect of government appointing its staff and led to the emergence of accountants as a class in government. The overall development of a new nexus between governments and their investing public contributed to the colonization of the state by financial interests.^[3,4] During this stage, the need for transparency received wider acceptance, although it was seen primarily as that of the investing class.

During the third stage, reflecting the gradual development of the legislative institutions and their powers to review the “wisdom, faithfulness and economy” with which parliamentary grants were spent, efforts were made to appoint a Commission of Accounts and a Commission on Audit (a predecessor of audit as practiced now), culminating in the establishment of a permanent national audit agency to review the use of approved financial resources. This stage emphasized that transparency was not an end in itself but was a means for the legislature to ensure accountability of the government and its officials. What was however, within the domain of the legislature, was also within the reach of the public. These British practices, were in due course, replicated in the British commonwealth countries and variations of their approach were introduced in others. A result of these efforts was the explicit recognition of the need for fiscal transparency as a feature of a democratic government.

The fourth stage represents the more recent experience of governments, particularly since the 1950s. The growth of the welfare state, as well as the steady

expansion in the size of governments and the range of activities undertaken by them, contributed to an inexorable growth in expenditures and, over the years, to growing fiscal deficits and crisis. The emergence of fiscal crisis contributed to the erosion of the public trust in government and to greater demands for the involvement of the public, along with its legislative institutions, in shaping their own fiscal destiny. It was suggested that improvements in governance required the empowerment of the community and its participation, whenever possible, in the formulation of policies. In turn, this implied that there should be greater fiscal transparency so that the community recognizes where it is and determines where it should go. The idea of improved governance came to be dependent on the reality of fiscal transparency.

The fifth stage reflects the series of financial crises in the 1990s that had a substantive impact on the emerging market countries. These countries, dependent on capital inflows, were highly vulnerable to sudden changes in market perceptions (i.e., perceptions of the investing class) and their destabilizing effects. Preventive action, aimed at forestalling the crises, or at a minimum, reducing the intensity, required the strengthening of the fiscal system, and enhancement of fiscal transparency. Such transparency was aimed at correcting the information asymmetries and associated belief systems. Cumulatively, the result is that extensive fiscal transparency has become an essential feature of governments. The content of fiscal transparency has not, given the diverse developments, however, been articulated coherently, except to some extent by international financial institutions.^[5,6]

Objectives

Reflecting the various influences in the mutation of fiscal transparency, the objectives sought to be achieved comprise three groups:

- *Stewardship of resources:* Governments should provide data on the state of finances, for the past, present, and the future so that the community can make its own assessment about the viability of the policy stance, including the preventive actions taken or contemplated to reduce or avoid financial market failures. This requires that the information be comprehensive, including all activities, as well as contingent liabilities, on a consistent basis. The data must comply with specified standards.
- *Adequacy of the fiscal machinery:* Information is needed on the various aspects of tax administration, expenditure management, lending and borrowing operations, sales and purchase operations, and management of the financial portfolio. Efforts in

this regard are aimed, in part, to restore the credibility of the public management systems and to assure the community of the continuing effective functioning of the fiscal machinery. As an integral part of this effort, attention paid to ensuring the due process, prevention of opportunities for corruption, and the smooth working of the accountability channels associated with legislative or other forms of social action is revealed to the public.

- *Decision-making approaches:* There should be a window of opportunity for the community to be informed about the decision-making approaches behind the fiscal policies sought to be pursued. The window should enable an understanding, even as decisions are made (and not after they have been made) on the main components of fiscal policy—pursuit of macroeconomic stability, effective performance in the delivery of services, and pursuit of economy and efficiency.

These objectives aim at the complete fulfillment of fiscal transparency and, to that extent, go beyond the guidelines issued by international financial organizations. The guidelines issued by these organizations place more emphasis on the legal framework (intended more for international audiences), linkages with macroeconomic trends and policies, operational procedures, dissemination of fiscal data, and channels of accountability with legislatures. Correspondingly, less focus is laid on the adequacy of the fiscal machinery and delivery of services, aspects that are of critical importance to the community.

Content of fiscal information

The fiscal information provided to the public and the arrangements for transparency have their roots in the government accounting system, which is a homogeneous source of supply. The users of the information are, however, varied and the heterogeneous groups that include the community, legislatures, market analysts, investors, policy makers, external donors, and others. Information aimed at meeting these diverse requirements is provided through various channels. The features of the information supplied are shown, in detail, in [Table 1](#).

Uses and limitations

The demands for additional information on government fiscal operations have grown during recent years. Along with these demands, the capacity of government has also increased severalfold, to meet them. To a large extent, this has been facilitated by the application of computer technology to government transactions, transforming a long drawn-out, slow, and often

Table 1 Fiscal transparency: components, instruments, and features

Functional area	Instruments	Features
I. Structures and policy spheres		
(a) Structures		
• Functions and fiscal responsibilities of central, state, and local governments • Transfers from the central government to the state and local government; where revenue collections are decentralized, states, regions, or provinces may make transfers to the central government	• These are, in general, specified in the constitution and associated legal framework. • These transfers may be specified in the Constitution. Annual transfers determined with reference to legal criteria may be shown in the budget documents; where budgets are not available to the public (see below), the quantum of these transfers and their utilization may not be known.	• In federal types of countries, the financial relationships among these levels tend to be complex. • The experience of federal types of countries shows that these transfers, including devolution of resources, are determined in a quasijudicial process; the findings, as distinct from proceedings, are made public. • Experience of unitary governments is far more diverse; the details are contained in the budget documents (and are specifically shown as transfers), while in a few cases, they remain obscure.
• Autonomous bodies of the central governments	• These bodies have, in general, their own budgets, and the extent of dependence on government is shown therein.	• Access to these documents is problematic and dependent on the laws governing the autonomous bodies.
• State-owned enterprises	• Enterprises are obligated, in most cases, to publish their annual balance sheets and accounts. Their budgets, where the activities tend to be commercial, are not made public. The main instruments of transparency are the accounts and the periodic reports published by them. These reports may be more frequent where there is a high degree of dependence on the capital markets.	• Their accountability to the legislatures differs very widely: • The accounts and associated reports may not specify the costs of non-commercial objectives that the enterprises follow at the behest of governments. Moreover, subsidies given by governments may not have the specific end use, given the fungibility of resources, indicated by governments.
• Relationship with central bank/monetary authority and other public financial institutions	• These relationships are usually specified in the form of a law, inter-alia, indicating the tasks and responsibilities of the institutions in the management of public debt. The financial institutions publish their annual accounts and other reports that are within the public domain.	• Although the accounts are available, the quasifiscal accounts or activities undertaken by them may not be fully shown. Standards in this regard are evolving, and it is likely that more detailed information will be available on the quasifiscal activities.
• Relationships with the corporate private sector	• In most cases, the patterns of government equity ownership and the responsibility of governments in regard to regulation are specified in law (e.g., Companies Act). In some cases, regulation may be enforced through autonomous agencies.	• Laws and associated guidelines are generally matters that can be enforced through judicial means. In some countries, however, the ownership patterns are both highly complex and opaque.

(Continued)

Table 1 Fiscal transparency: components, instruments, and features (*Continued*)

Functional area	Instruments	Features
(b) Relationships with legislatures	- The patterns vary among countries. Broadly, there are three types of legislatures 1) where legislatures have the dominant role, 2) where the executive has the dominant role, and 3) where legislatures do not have any role in terms of annual management of finances, except that they are kept informed on all key aspects. In several countries, there is a framework of delegated legislation within which the executive wing of the government has powers to levy taxes, duties, fees, etc., and to spend the proceeds. - Legislatures are provided with medium-term fiscal strategy, development plans, medium-term budgets, annual budgets, and supplementary budgets. All these documents are in the public domain.	The usefulness of the documents prepared by governments to determine the current fiscal status and its viability varies considerably among countries. In some countries, budgets are not available to the public; instead, summaries of the main features are presented.
(c) Primary fiscal instruments	- The range of fiscal instruments has expanded over the years. In addition to the annual budget intended for purposes of legislation, several documents seeking to provide background information are provided. These include multiyear rolling budgets and other documents referred to above. The most important instrument continues to be the budget. To serve the purposes of transparency, budgets are required to be: <i>Comprehensive</i>, covering all transactions, including foreign aid, proceeds of taxation, gross spending, gross borrowing and lending, and gross buying and selling. - As <i>integral part</i> of the above and reflecting the full status of finances, data on extrabudgetary accounts, quasifiscal activities, tax expenditures, guarantees provided, and consequent contingent liabilities are also needed; - On a <i>gross basis</i> to avoid misleading conclusions, expenditure offsets, etc., are to be avoided.	- Although all countries have budgets, their features vary considerably. - In many cases, large chunks of expenditures may be organized in the form of extrabudgetary activities or as quasifiscal activities. This feature limits the usefulness of the main budget. More significantly, in the absence of data on guarantees and related contingent liabilities, the community may not have the data to assess critically the current status of government finances and their sustainability. - In general, many budgets are organized on a gross basis, but a frequent resort to netting is also common.

(Continued)

Table 1 Fiscal transparency: components, instruments, and features (*Continued*)

Functional area	Instruments	Features
	• <i>On an accounting basis</i>, that reflects the cash position as well as liabilities. • <i>A classification</i> of government transactions into a functional program, as well as economic types, to illustrate the broad purposes of expenditures.	• Most budgets are organized on a cash basis. During recent years, attempts have been initiated to introduce forms of accrual budgeting. • Patterns of classification vary considerably among countries. Different practices are in vogue for budgets and for international reporting. Categories such as defense remain, for the most part, opaque.
II. Fiscal Management		
(a) Objectives	• The range of instruments includes fiscal responsibility legislation, medium-term rolling framework, and development plans. These documents provide the essential context within which the annual budget serves as the most important fiscal instrument.	• During recent years, some countries, such as Argentina, Brazil, etc., have—following the experience of Australia and New Zealand—enacted fiscal responsibility legislation indicating the broad goals of fiscal policy.
(b) Consolidated budget	• The budget and its supplementary instruments seek to reflect the totality of government finances within a country. Because regional/state/provincial budgets have an important role, they need to be consolidated for the country as a whole.	• In unitary forms of government, budgets reflect the total picture. In federal types, however, the lower levels of government formulate their own budgets. In several countries, these are consolidated, usually after a lag, and made available to the public. Even here, the budgets of local governments (county and city governments), being too many, may not be included in the consolidation exercise.
(c) Macroeconomic framework	• The purposes of the annual budget reflect the times. To facilitate an understanding of this crucial element in fiscal policy, assumptions about the growth in the economy, exchange rate, inflation rate, aggregate demand factor, and estimated capital flows are indicated.	• The actual experience in this regard varies considerably. In most cases, the macroeconomic framework may not be explicit. In some cases, autonomous research organizations may publish them as a part of their studies. Objectives, where indicated, tend to be too general and may not constitute a strategy.
(d) Annual policy making	• The annual budget, being the main vehicle, is expected to indicate the following: • New policies to address the problems in the economy. As an integral part of this effort, new outlays are distinguished from continuing policies. • Changes in revenue policies including changes in tax expenditures. • Changes in lending policies.	• The approaches to annual budget vary among countries, depending on the role of the legislature. • Although new policies are highlighted, the expenses associated with them and their continuing financial implications may not be adequately analyzed. • Tax expenditures, guarantees, and changes in lending policies do not, in general, receive specific focus in the documents.

(Continued)

Table 1 Fiscal transparency: components, instruments, and features (*Continued*)

Functional area	Instruments	Features
	• Policies aimed at deficit containment including austerity management. • Changes in public debt patterns, including maturity. • Changes made in delivery of services and expenditure benefits. • Identification of high-risk areas (e.g., foreign aid). • Some of these areas may be made public before the presentation of the annual budget, through public announcements, white papers, and sessional documents.	• Deficit reduction has been a dominant theme during recent years. Austerity management, however, may not be specified in detail to prevent lobbying by interest groups. • Although data on outstanding domestic and foreign debt are provided, their holders and maturity patterns—in particular, in the area of foreign debt—may not be indicated in detail. • Expenditure benefits have not received adequate attention until recently. • Risk areas and associated efforts at risk management remain, where undertaken, at a nascent stage.
(e) Detailed objectives of departments and agencies	• The objectives to be achieved during a fiscal year are to be stated in detail in each agency budget.	• Objectives, where indicated, tend to be too general and may not constitute a strategy.
(f) Performance orientation	• The agency budgets should also indicate the achievements, in terms of delivery of services, expected during the fiscal year. This constitutes an important vehicle for full accountability. As an integral part of this data on cost–service–quality linkages are sought to be provided.	• Performance budgeting in governments has had a chequered career. During recent years, there has been a revival of some aspects of this system. Many countries have yet to implement this.
(g) Pursuit of efficiency and economy	• Agency budgets are also expected to indicate the specific efforts made to achieve economy and efficiency.	• To a large extent, this remains to be fulfilled.
(h) Changes in supporting administrative infrastructure	• Governments announce, through annual budgets, changes made in the tax collection machinery, expenditure management, and debt management. In tax administration, the effort is to augment the legal specification of the tax basis, while reducing the administrative discretion in its application. In expenditure management, the intent is to facilitate internal financial operations of the spending agencies. • In debt management, the instruments seek to provide more information on the currency of debt, separation of interest from principal, etc.	• In tax administration, the major area of darkness continues to be the use of discretionary powers by tax officials and related rent-seeking behavior. In expenditure management, procurement and related contracting remain, as noted below, less transparent. Debt transactions also remain, in some cases, shrouded in secrecy.

(Continued)

Table 1 Fiscal transparency: components, instruments, and features (*Continued*)

Functional area	Instruments	Features
III. Implementation of budgets	- Notwithstanding differences of degree, several stages of policy implementation are common to all countries. These include the following: - Phased release of budgetary authority - Organized cash management that facilitates a linkup with debt management - Award of contracts, procedures for tendering and contracting - Procedures to ensure budgetary outcome as intended - Specification of performance measures	Several of the activities enumerated are usually considered as “in-house” activities and, as such, may not be open to the public. The primary issue for the community is whether there is adequate machinery empowered to deal with these aspects and whether the machinery is working effectively. In practice, the most controversial area is the award of contracts. The range of contracts has widened considerably and now includes services such as day care centers. These contracts may not, in several cases, be in the public realm. Specification of performance is still at a nascent stage. The budgetary outcome may, in some cases, be technically managed through the accumulation of payment arrears.
IV. Accounting and reporting	The accounting system is intended to ensure that the tasks inherent in the stewardship of money are being handled. It should therefore specify 1) the basis-cash, accrual, etc., 2) the procedures for payment and budget monitoring, and 3) the compilation of periodic and year-end accounts. Accounts provide the data for the past, whereas the budget contains the present and projected trends.	- Emphases on procedures vary. In general, however, accounting systems are designed to handle the tasks enumerated. During recent years, however, significant leakages have become common. These relate to the exclusion of off-budget accounts, guarantees, contingent liabilities, quasifiscal activities, and tax expenditures. - Periodic reports on the status of government finances are now being released by several countries in conformity with the desire of the international financial institutions to publish standardized fiscal data. Intra-year trends may however, be significantly different from the year-end outcome as developments in the last quarter have a unique pace.
Administrative reports	Fiscal and other agencies are required to issue annual reports illustrating their activities. These agencies include the tax collection machinery.	These documents, which vary enormously in content and coverage, are in the public domain in most countries.
V. Evaluation	Government activities are evaluated by their own agencies to gain experience in the utilization of resources.	Evaluation is limited in most governments and, where conducted, may not always be available to the public.
VI. Audit	There should be adequate arrangements for an independent audit agency to verify the appropriation accounts and carry out accountancy, financial, and performance audits.	Although many countries have independent audit offices, their effective contribution is dimmed by their limited purview (policy matters are excluded) and lack of firm legislative arrangements for a review of the findings.

(Continued)

Table 1 Fiscal transparency: components, instruments, and features (*Continued*)

Functional area	Instruments	Features
VII. Independent standards	Standards are specified for the maintenance of accounts and audit. Similar arrangements exist in some countries (e.g., Sweden) for rating the overall financial management systems, including tax collection machinery.	Accounting standards for government are evolving and, as a result, more governments may have them in the future.
VIII. Legislative review	Submission of the budget, consideration of new policies or changes in the existing ones, and annual accounts provide several opportunities to the legislature to exercise the traditional control of purse.	In practice, the power of the legislatures vary considerably. Even where endowed with requisite powers and instruments, they may not exercise them in view of the party discipline and related procedural limitations.

tedious process into a quick and often cost-effective way of using information for policy making. Notwithstanding the assiduous efforts to improve the coverage and content of fiscal transparency, from the user's point of view, several problem areas remain to be addressed.

In the current situation, approximately one-third of the world's population has little access to the budget details and, thus, to the fiscal policies that have a profound and continuing impact on their lives. People living in centrally planned countries such as China, Vietnam, or quasi monarchies like the Gulf Kingdoms, and similarly placed governments receive few budget details. This is in stark contrast to the former Soviet Republics, which have made a quantum jump, in a short period, to the establishment of fiscal transparency as in other democracies.

The transactions of government and the structure of their portfolios have changed during recent years. In several cases, central governments have become funding and policy agencies, while the operations are conducted by the other levels of government, as well as by non-governmental organizations and the corporate sector. Information in regard to the latter tends to be brief, where provided, and aggregative in nature. To the extent that these shadow governments are not fully covered the usefulness of data on fiscal operations tends to be reduced.

Fiscal transparency does not yet take the community into confidence in the realm of public policy making. In taxation, concerns of secrecy, with regard to defense concerns of security, have contributed to a large degree of opaqueness (North American Treaty Organization countries have begun efforts to provide more information on defense costs). Similarly, little information is available about the effectiveness of the

fiscal machinery (see Ref.^[7], for a discussion of the limitations of audit and legislative control).

The data provided are mostly intended to meet the requirements of the investing class and do not go far in illuminating the fiscal status for the common man. The language of data is generally complex and, without the aid of a professional interpreter, may not be clear to the general public. The community's preference is for analytical data, rather than the voluminous raw data about operations.

Fiscal transparency, unaccompanied by channels of public accountability,^[2] is not likely to be effective. In many cases, however, these channels remain to be effective; thus, more remains to be achieved.

Foreign Policy Analysis

Eric K. Leonard

Shenandoah University, Winchester, Virginia, U.S.A.

INTRODUCTION

In the 1950s, the field of international politics (IP) split in two. The study of IP became a systemic view of foreign relations, whereas foreign policy analysis (FPA) began the process of “opening up the state” and examining its contents. These two divergent paths examined very different causal factors for global events. However, the overlap between these two fields was always undeniable. This article begins by examining the split between IP and FPA, with a focus on the difference between the traditional theoretical perspectives of these two fields of study. I then turn to the primary goal of this article, which is to show how we can bring these two fields back together. The method of unification is social constructivism and its emphasis on the co-constitutive relationship between agent and structure. If employed as a method of FPA, it may assist scholars in a more complete understanding of the decision-making process.

THE EMERGENCE OF FPA

Prior to the 1950s, IP, as a field of study, was more or less cohesive. Those who studied IP tended to blend the analysis of state relations with an assessment of foreign policy decision making. Although the early study of IP contained its fair share of disagreements (in particular, the realist-idealist debate of the 1930s and 1940s), the field remained unitary. Foreign policy analysis, although clearly a part of our world since at least the rise of the modern state system, did not emerge as an autonomous academic field of study until the early Cold War era. Foreign policy analysis evolved as a part of IP, finding its voice in the classical realist and idealist writings. However, the scientific or behavioralist revolution within the social sciences allowed the study of FPA to branch out on its own.^{[1]a}

Foreign policy analysis “refers to a complex, multilayered process, consisting of the objectives that governments pursue in their relations with other governments and their choice of means to attain these

objectives.”^[2] Clearly, this form of analysis lies within the study of IP. However, during the 1950s, the IP scholars began to focus their attention on “actor-general” theories and turn away from any acceptance of “actor-specific” theories.^[3] The best way to describe the actor-general type of analysis is that it is systemic in nature. This model describes the state as a rational unitary actor which acts in accordance with the national interest. If scholars of international relations are searching for a causal factor for world events, they need to look at systemic factors and not within the black box of the state. In effect, this form of analysis entails the study of like units acting within an anarchical system. What this perspective does not take into account, at least not to any large extent, is the inner workings of the state and its domestic relations.

Realism is the quintessential example of actor-general theory, as one can see by examining its core assumptions. First, realists view the state as the most important actor within the international system. No other actor rivals the importance of the nation-state. Second, they consider the state a unitary, monolithic actor. In other words, the state is considered a “black box” that acts, at least in the international arena, in a unified fashion. The turmoil of domestic politics is not a consideration for realist scholars because the primary causal factor for states’ actions is external or systemic, not internal or domestic. Third, realists consider states rational actors. This “rational hypothesis” allows an IP scholar to view state motives as similar and unitary. This hypothesis also constructs a system of states that always act according to their national interest—which, for realists, is defined by security and relative power. Finally, the anarchical structure of the system is the underlying factor for all actions within the international system. Due to the fact that there is no overarching authority, states will act to maximize their relative power position within the system.^{[4,5]b}

The systemic turn of IP study is what FPA scholars find so unpalatable. Foreign policy analysis scholars believe that if we are to understand the relationship among states, we must first and foremost open up the black box of the state. This entails moving from

^aProvides an excellent description of this split along with a detailed discussion of the divergent models within IP and FPA.

^bMorgenthau is the quintessential classical realist, while Waltz is the definitive text on neorealism and its structural emphasis.

an actor-general model of understanding to an actor-specific model of understanding. Foreign policy analysis scholars began the process of unpacking the black box of the state in the 1950s.^[6] This break from traditional understandings of foreign policy decision making—understandings that are predicated on viewing the state as a rational unitary actor—forever changes the field of FPA.

TRADITIONAL FOREIGN POLICY MODELS

When foreign policy scholars opened up the black box of the state, they discovered a plethora of factors that influence foreign policy decision making. Foreign policy analysis was no longer tied to the static thinking of structural models. Foreign policy analysis scholars could now engage the inner workings of the state and examine their impact on the decision-making process. Although numerous different perspectives emerged from this new form of analysis, this article will examine the three most influential models: bureaucratic politics model, small group context model, and individual decision-making model.^{[7]c}

The statement, “where you stand depends on where you sit,” best describes the bureaucratic politics model. A bureaucratic politics assessment of foreign policy centers on the debate and negotiations that occur between competing bureaucratic agencies. Instead of focusing on the rational decision-making process of the state, bureaucratic politics analysts focus on the self-promotional style of competing organizations. Foreign policy, according to this model, is created from a negotiation process between competing organizations, which are each attempting to implement policies that benefit or highlight their organizational strengths. Thus rational unitary decision making is no longer sufficient for understanding the reality of intergovernmental competition.

This model gained credibility with the publication of Allison’s seminal text, “Essence of Decision: Explaining the Cuban Missile Crisis.” In Allison’s analysis of the crisis, three competing paradigms of decision making are compared. Allison concludes that the first model, the rational actor model, is insufficient due to the simplicity of its conclusions. Allison asserts that the decision-making process during the crisis was much more complex and involved a negotiation process among several competing governmental organizations. Therefore Allison tends to favor the examination of intraorganizational debate and interorganizational

debate (both of which engage an assessment of bureaucratic politics) as a means of FPA.

The small group context model focuses on the inner circle of foreign policy decision makers and the debate, or lack thereof, that arises within the group. Within the realm of American foreign policy, the analysis would center on the presidential cabinet. Most small group context analysts agree that this form of decision making is not the best. According to this model, the sociological dynamics of such a group tends to homogenize the perspectives of its participants. The result, often times, is a lack of policy options due to the desire for personal acceptance and group cohesion.

The seminal text on small group context, or at least its negative consequences, is “Victims of Group Think” by Janis. Janis’ sociological analysis of the dynamics of small group decision making asserted that group consensus was the prime motivator for many foreign policy decisions. This form of political decision making hinders the ability to ascertain good policy because of either the lack, or complete loss, of viable options. The small group becomes homogenized, thus prohibiting any of the positive components that may have resulted from a multiplicity of perspectives. In fact, there is a loss of multiple perspectives to the one dominant group consensus. Janis tested this hypothesis on several foreign policy case studies, including the Bay of Pigs incident, the Cuban Missile Crisis (which actually shows the positive attributes of small group decision making), the escalation of Vietnam, and others.

The individual decision-making model focuses on the primary authority figure within the nation-state—usually the President or Prime Minister. This psychological analysis of the leader depicts the decision-making process as one in which the ultimate ability to create foreign policy resides in one person. If, according to this model, FPA scholars are to understand the decision-making process, then they must examine the individual characteristics of the primary actors. This microlevel analysis would include an examination of personal characteristics (such as leadership style, conflict management, and personal perception/political history), along with the context within which the individual is making one’s decision.

There is not one seminal text for this model of FPA. However, one of the more influential texts is George’s, “The ‘Operational Code’: A Neglected Approach to the Study of Political Leaders and Decision-Makers.” This text describes the importance that a leader’s core political beliefs have on the foreign policy process, thus placing emphasis of foreign policy decision making on the individual. George’s assessment of the role of personal political beliefs, along with management styles within the decision-making process, exemplifies this most microlevel of analysis—the individual.

^cSee Ref.^[3] for a comprehensive discussion of foreign policy models and their historical evolution.

Ultimately, the message of individual-level FPA scholars is that decision making in the world of foreign policy can turn on the perceptions, personality type, or management style of the world's leaders.

What all of these FPA models have in common is a general acceptance that individual actors have the greatest influence on the foreign policy decision-making process. This conclusion completely counters the traditional understandings of FPA that emerged from the field of IP. These traditional understandings focused on the state as a rational unitary actor whose decision making is affected primarily by the systemic construct. But why does an analysis of foreign policy have to exist within this dichotomous relationship? Is the best understanding of foreign policy achieved by engaging in an either/or framework of analysis? Currently, many scholars feel that there is a way to incorporate both IP and FPA understandings of decision making into their analysis. The link between these two divergent understandings is social constructivism.^{[8]d}

SOCIAL CONSTRUCTIVISM AND FPA

Social constructivism rests on the premise that the world around us is irrevocably social, and that an examination of global social relations will provide us with a more complete understanding of IP and, in the case of this article, the foreign policy decision-making process. According to this analytical perspective, the world exists in its current form because we—agents in the world—have made it that way. Such a perspective is very amenable to the FPA scholars and their models of decision making because the focus rests on the agents involved in the process. However, social constructivism does not view the decision-making process as a one-way street. Yes, agents do make the world, but conversely, social relations also make agents.

Thus social constructivists also acknowledge the causal factors of the traditional IP literature. This complex form of analysis provides us with a co-constitutive model of foreign policy, with both agents and structures making each other. In general, social constructivists do not privilege one perspective over another, but recognize the complexity of decision making in world politics, thus acknowledging the importance of both actor-general and actor-specific perspectives. It

is the co-constitutive relationship of these two perspectives that social constructivists want to examine.^{[9,10]e}

When thinking about foreign policy, the first attribute that social constructivists purport is that no concept, term, institution, or agent of foreign affairs is static. Because of the socially constructed nature of the world, the reproduction or reconstruction of everything is possible. This reconstruction simply depends on the interaction between the relevant agents and social arrangements, and, more importantly, the rules that guide those agents and social arrangements. Therefore we cannot think of the defining concepts of world politics/foreign policy as static institutions or discourses.

Second, social constructivists agree that foreign policy decision making does not come about through one causal factor, as traditional FPA or IP scholars would have us believe. Instead, decision making results from the interplay between actors (which include more than just states and individual leaders) and context. Social constructivists privilege neither factor. However, what social constructivists do privilege is the social relationship between the two (agent and structure), which causes a certain decision-making process to occur.

One problem that arises from this rich and complex understanding of foreign affairs is qualifying the relationship that exists between agent and structure. If social constructivists hope to study foreign policy from both agent-general and agent-specific perspectives, how do we link the two forms of understanding? The link occurs in the form of action and interaction. Social constructivists do not accept that agents/actors and or context/environment are simple and static. Both agents/actors and structure/context are malleable entities, and the change that may or may not occur in both of these entities comes about via action and interaction. This is, in fact, the making of our world, or, in the case of FPA scholars, the making of foreign policy. An example from the current global context may help to clarify this approach.

The current situation in Iraq—and, in particular, the United States' decision to invade—is a hot topic of conversation among FPA scholars. How does one understand the motives behind the U.S. invasion? Was this action generated primarily by the agents involved, or were these agents simply acting according to the current structure? A social constructivist would answer yes to both questions. How does one understand the decision to invade Iraq if you disregard either the actors involved or the structure? The fact that George W. Bush is President of the United States is crucial to understanding the decision to invade. His boisterous, do-it-alone (unilateralist) attitude is a primary causal factor in the decision-making process, as is the individuals that he has surrounded himself with. However, an analysis of the President's personal

^dKubalkova's "Foreign Policy in a Constructed World" is one text that attempts to bring together these two divergent areas of policy study by engaging in constructivist ontology.

^e"Constructivism: A User's Manual" and "Making and Remaking the World for IR 101: A Resource for Teaching Social Constructivism in Introductory Classes" provide two excellent introductory sources to the study of world politics through a social constructivist perspective.

perceptions, management style, etc., along with an analysis of the aforementioned traits of the presidential cabinet, are not sufficient to understand the decision to invade. One major question looms: would the United States have invaded Iraq if 9/11 had never happened? I would argue no, thus showing the importance of context and its impact on the agents involved. 9/11 made the foreign policy decision to invade possible, but so did the election of George W. Bush. The crucial area to study for FPA scholars is not simply the context nor the individuals, but the interaction between these two. Social constructivism may be more complex than previous FPA approaches, but it is also more complete in its assessment of foreign policy.^{[11]f}

CONCLUSION

So where is the field of FPA headed in the coming years?^{[12]g} This article has attempted to show both the divergent positions within the study of FPA and a new form of analysis that might serve as a bridge within the field. With that said, the future of FPA may or may not find its theoretical basis in social constructivism. Constructivism may not solve the long-standing debate between traditional FPA and IP scholars, along with the subdebates contained within FPA. However, if FPA scholars are willing to engage in a social constructivist assessment of foreign affairs, they may find the bridge that brings these seemingly opposed fields of study back together. As this form of analysis grows in acceptance, I believe that its applicability to multiple fields of study will grow. Nevertheless, ontological shifts are slow, but constructivists can serve as a repairperson for the IR/FPA split, if the analysts allow it. The result would only benefit the field and our understanding of foreign policy decision making.

Forms of Government

Victor S. DeSantis

*Department of Political Science, Bridgewater State College,
Bridgewater, Massachusetts, U.S.A.*

INTRODUCTION

The legal relationships between states and local governments are extremely complex and vary widely from state to state. Local governments, herein used to describe municipalities and counties, are legally considered to be creatures and agents of state government and, as such, subordinate to that state. All power and autonomy that local governments possess are granted to them through state action, and that power can be enhanced and rescinded. This legal principle is referred to as Dillon's Rule and dates back to the late 1800s.

State law, as well as a region's political culture and traditions, affects the selection of a local government's organizational structure. Although three levels of state law establish the parameters of local government autonomy—the state constitution, the state legislature (in the form of statutes), and state charters—many forms of government issues are specifically addressed in state charters. Charters are the legal mechanism that states use to recognize the existence of local governments and generally provide detail on the local government organization, powers, and responsibilities. Charters may be proffered by legislation and chosen by the jurisdiction or, in the case of home-rule jurisdictions, drafted and approved locally by citizens. Much like a state constitution, charters enumerate the basic purposes and tasks of local governments, the selection and powers of local officials, the authority and process for passing local ordinances or bylaws and, finally, the basic structures or forms of municipal and county government.

MUNICIPAL FORMS OF GOVERNMENT

There are five general forms of municipal government found in the United States today. These are the mayor–council, council–manager, commission, town meeting, and representative town meeting forms. Although each form retains distinct structural characteristics, it appears that there has been a modest, but consistent, movement since the mid-1980s toward council–manager forms of government, and away from mayor–council and commission forms. Specifically, research indicates that there has been a general

convergence of the different forms over the past several decades that is especially apparent between the mayor–council and council–manager systems.^[1–3] In addition to the overall movement toward the council–manager model, other less noticeable but important changes in the structures of local government have also surfaced.^[4,5] First, an increasing percentage of communities with mayor–council or town meeting forms have hired chief administrative officers to assist with the day-to-day operations of the government. Second, these chief administrative officers have increased their budgetary and appointment powers relative to the elected officials. Finally, a decreasing percentage of municipalities report giving their mayor a veto power over council actions.

The 1996 national Municipal Form of Government survey, conducted by the International City/County Management Association (ICMA), indicated that the majority of American cities operate under the mayor–council or council–manager form. The 1996 ICMA survey data show that 51.9% of responding communities used the council–manager form, whereas another 31.9% used the mayor–council form. The remaining survey respondents used the commission, town meeting, or representative town meeting forms, or were unsure of their specific categorization.^[4]

Mayor–Council

The mayor–council form of government (Fig. 1) is most prevalent in the nation's larger cities and smaller jurisdictions. In this form, there is usually a legislative body, the city/town council, and a separately elected chief executive, the mayor. The actual titles afforded to the legislative body and executive official vary widely and are usually based on long-standing local or regional tradition. There are generally two types of mayor–council government, the “strong mayor” and “weak mayor” models. The substantive difference between these types depends on the administrative duties and power given to the mayor.

The strong mayor form of government centralizes the administrative powers in the hands of the popularly elected mayor, while vesting the legislative function in the elected council. In this form, the mayor

Fig. 1 Model of the typical mayor-council form of government.

has the authority to prepare and control the administration of the budget, appoint and remove department heads, preside over council meetings, and set the council agenda. The strong mayor may also have a veto power over council actions. Supporters of a strong mayor government argue that a strong mayor provides leadership to a community while being held responsible to citizens for their actions. Also, a strong mayor may be better able to exercise political power in bigger cities to bring together large and diverse interest groups.

Increasingly, strong mayors are also opting to appoint a chief administrative officer for the city who serves at their pleasure to focus on the details of day-to-day government administration, such as budget preparation and personnel management. This arrangement frees mayors to concentrate more on their roles out of city hall and in the community, and also increases their ability to deal on policy matters and agenda setting.

The weak mayor system is the older of the two mayor models, resulting from the traditional American distrust of strong executive power. The weak mayor is often selected from among the council members, instead of being elected directly by the people. The weak mayor generally has limited appointment and budgetary authority and does not have veto power over council. This system is also characterized by its decentralized and fragmented nature, with multiple department heads and other local officials directly elected by the community. The weak mayor form of government is the more commonly used in the United States, especially in smaller communities.

The dawn of the twentieth century was an important watershed period for municipal government in the United States, most specifically for the traditional mayor council model of government. Across the nation, political bosses and machine politics were the norm in many larger cities. Although the newly formed National Municipal League first supported the strong mayor form in 1898 in an effort to decrease the power of political machine bosses, this effort was short lived. Further efforts at reforming the structure and process of local government in reaction to the widespread

corruption and inefficiency surfaced during this period, which became popularly known as the Progressive Era. At the core of this “good government” movement were the upper middle-class residents that had grown tired of the powerful political machines and the immigrant groups keeping them in power.^[6] Their specific agenda included numerous election reforms and the promotion of more efficient and professional government through civil service systems, competitive bidding practices, and forms of municipal government that provided for an apolitical appointed (rather than elected) executive. These reform efforts led to experiments with the commission and council-manager forms of government.

Commission

Cities and towns with the commission form of government provide for a full centralization of power in the elected council to make policy and direct the executive operations of the local government. Each elected commissioner serves as a member of the legislative body and is also elected to lead one or more administrative departments. This form continues to decline and is currently found in only a few communities nationwide.

In 1900, in response to a disastrous hurricane and flood that crippled the city of Galveston, the Texas governor appointed a set of five businessmen (later elected by the community) to handle the policy and administrative functions of the community. Supporters of this model believed that this plan was a positive step toward improving local government because it unified all power in the hands of a board of commissioners. Many of the good government reformers, themselves from the business community, began promoting the commission form, and it was adopted widely over the next decade.^[7] However, one of the weaknesses of the commission form that began to surface was that it fragmented administrative functions and was too unwieldy. Reformers later latched on to the idea of the council-manager form, a hybrid of the strong mayor and commission forms of government.

Council-Manager

Another form of municipal government that grew out of the Progressive Era is the council-manager form (Fig. 2). Council-manager government combines the strong political leadership of elected officials with the strong managerial leadership of an appointed professional manager. This form of government rests the policy-making power in the hands of the elected legislative body. A professional manager serving at the pleasure of the elected body is charged with day-to-day

Fig. 2 Model of the typical council–manager form of government.

administration of the government. The manager commonly has the authority to direct administrative operations, appoint administrative officers, prepare and administer the budget, and advise the council on matters of policy.

Although many council–manager forms of government have a popularly elected mayor, many of the mayors in this form are selected from among the membership of the legislative body. These mayors have restricted powers that are generally limited to presiding over council meetings and making appointments to boards or commissions. Mayors are part of the council and vote as regular members, although they have little or no veto power. Proponents of the council–manager form of government argue that this structure allows supervisory and administrative responsibility to be centralized in one individual. This allows the individual's expertise and knowledge of administrative activities to be developed, while vesting all power in an elected governing body to promote representative democracy.

The council–manager form is actually a hybrid of two previous government structures: the strong mayor and commission. In an effort to improve on the decentralized and fragmented commission form, Richard S. Childs and other local government reformers proposed a plan that combined the commission form with a strong administrative element, concentrating all administrative powers in the form of a single professional manager. This became the council–manager plan and, in 1915, the National Municipal League revised its model city charter to reflect this new form of government.^[7,8]

Town Meetings

The town meetings of New England are often considered to be one of the last modern-day examples of direct democracy in action. This distinction comes from the mass public meetings, in which any registered voter of the jurisdiction may attend, speak, and vote on

various policy, administrative, and budgetary issues. The town meeting process as practiced in New England can be traced back to the Massachusetts Bay Colony of the late 1620s^[9] and is currently found only in the New England states of Maine, Massachusetts, New Hampshire, Vermont, Rhode Island, and Connecticut. However, in recent decades, the prevalence and operation of town meeting forms of government have experienced substantial tension and change.

The limited empirical evidence on town meetings indicates a growing trend toward abandoning open town meetings in favor of an elected town council or establishing a representative town meeting government.^[10] The representative town meeting involves the voters selecting a limited number of citizens to represent them and vote at town meetings. All citizens may attend and participate in the debate, but only the duly elected representatives may actually vote. Other New England communities have adopted a more incremental change by hiring full-time professional chief administrative officers, in addition to the open town meeting process.

Under the town meeting form of government, the town meeting is considered the local legislative body with the authority to pass ordinances and bylaws, and raise and appropriate funds. Each town with this form generally holds one annual town meeting and may also hold as many additional meetings (called special town meetings) as deemed necessary to carry out the town's business. A warrant (from the term “warning”) is issued to townspeople stating the date, time, place, and itemized agenda for annual and special town meetings. An elected moderator presides over the town meeting and has wide latitude in directing the debate and conducting business.

During the remainder of the year, the elected board (usually called selectmen) of three or five members is charged with running the daily operations of the town. Boards of selectmen carry out many appointing, financial, and licensing responsibilities granted to them by the town meeting. Many towns have added the position of chief administrative officer to assist the board in their administrative roles on an ongoing basis. These chief administrative officers serve at the pleasure of the board of selectmen and have their duties prescribed by board action or a town meeting bylaw.

COUNTY FORMS OF GOVERNMENT

As units of local government, counties have historically been considered administrative arms of state government and operate with more constraints than their municipal counterparts. In most areas of the United States, this means that counties operate with

less local autonomy or “home rule” authority and have their operations and structures dictated substantially by state law. There are three general forms of county government found in the United States today. These are the commission, council–administrator, and council–elected executive forms. Although the reform movement for county government came later in the twentieth century than the municipal reform movement, there has been modest improvement, especially over the last few decades. Many of these efforts have been aimed at improving and streamlining county operations and providing for greater professional leadership. Research points to increased usage of the council–administrator and council–elected executive forms. Indeed, the overall trend toward professional management in counties can be seen by the ever-increasing number of counties, even with the traditional form, that provide for a position of chief administrative officer.^[11]

Commission

The commission or plural executive form of government in counties is the oldest and most traditional organizational structure. A central governing board characterizes it with members usually elected by district. Although various names exist for this board, among the favorite are the board of commissioners or supervisors and the county court. Most often, the board selects one of its members as the presiding officer. Members of the governing board may act as department heads, but this is not a defining characteristic as in the municipal commission model. The governing boards share administrative and, to an extent, legislative functions with independently elected officials: the clerk, the treasurer, the sheriff, the assessor, the coroner, and others. Generally, no single administrator oversees the county’s operations. In some counties with the commission form, the structure includes an official (generally full time), such as the county judge, who is independently elected at-large to be the presiding officer of the governing board. As noted previously, many disadvantages associated with the commission form stem from the usual lack of a chief administrator to provide more professionalism, executive leadership, and accountability.

Council–Administrator

The council–administrator form of government for counties is similar to the council–manager form for cities, but three distinct variations are identifiable. In its strongest variation, the council–administrator form

provides for an elected county board or council and an appointed administrator. The county board adopts ordinances and resolutions, adopts the budget, and sets policy. The administrator, appointed by the board, has responsibility for budget development and implementation, the hiring and firing of department heads, and recommending policy to the board. In some counties, where a weaker version of the council administrator plan is in place, the administrator usually has less direct responsibility for overall county operations and less authority in hiring and firing, and may consult with the board on policy issues.

Council–Elected Executive

The third form of county government is the council–elected executive form. This system has two branches of government—legislative and executive—and more clearly resembles the strong mayor form of city government. Here, the county council or board assumes responsibility for county policies, adopts the budget, and audits the financial performance of the county. The elected at-large executive is considered the chief elected official of the county and often has veto power, which can be overridden by the council. The executive prepares the budget, carries out the administration of the county operations, appoints department heads (usually with the consent of the council), and suggests policy to the governing board. In addition, this official carries out appropriations, ordinances, and resolutions passed by the board and generally acts as the chief spokesperson for the county. When the executive is considered the chief political spokesperson, the executive often delegates the administrative responsibility for the daily county operations to a chief administrator. This form, along with the council–administrator form, has begun to receive more popular support over the past few decades and push counties forward in their quest for modernization.

Freedom of Information Act—Federal

Suzanne J. Piotrowski

Graduate Department of Public Administration, Rutgers University,
Newark, New Jersey, U.S.A.

INTRODUCTION

The Freedom of Information Act (FOIA) is the premier open government statute in the U.S. federal government. FOIA works to ensure a more transparent federal administration. The openness afforded by FOIA has become a central aspect of federal administration. After a long debate, FOIA was passed by Congress in 1966 and has been amended periodically. FOIA allows individuals or organizations to request documents from a federal agency. While not all documents are releasable, many are. Federal agencies may withhold documents that fall into nine broad exemption categories. Included within this entry is an overview of the theoretical underpinnings of the act, a legislative history of FOIA, and a short description of the major provisions of the act.

WHAT IS FOIA?

The Freedom of Information Act is one federal law that deals with open government. Other open government federal laws include the Privacy Act (1974), the Government in the Sunshine Act (1976), and the Federal Advisory Committee Act (1972). Implementation of FOIA is a major administrative function which cost over \$270 million in fiscal year 2001. Open government laws are not unique to the federal government. All 50 states have laws governing the release of government documents. Freedom of information and the free exchange of information is a global concern. Over 50 countries ranging from Albania to Zimbabwe have laws facilitating access to government documents. Over half of these international freedom of information laws were passed within the last 10 years.^[1]

Governmental transparency and democratic accountability are the underlying tenets behind FOIA. Governmental transparency refers to the ability to find out what is going on inside of government. Democratic accountability is holding elected and unelected government officials responsible for their actions. While the initial Freedom of Information Act was passed in 1966,^[2] the debate surrounding transparency in

government long predates the act. James Madison wrote in a personal correspondence:

“A popular Government, without popular information, or the means of acquiring it, is but a Prologue to a Farce or a Tragedy; or, perhaps, both. Knowledge will forever govern ignorance: And a people who mean to be their own Governors must arm themselves with the power which knowledge gives.”^[3]

Madison’s sentiments were included in the *Senate Report*, which accompanied the initial FOIA.^[4]

The idea of opening up the government and holding officials accountable is an essential aspect of democracy. Francis Rourke^[5] made this point eloquently: “Nothing could be more axiomatic for a democracy than the principle of exposing the processes of government to relentless public criticism and scrutiny.” Policies which work toward a more transparent government combat administrative and executive secrecy. As explained later in the section “How FOIA Works?” not all types of documents are releasable through FOIA requests; however, at its core, FOIA is a disclosure statute.

FOIA also has two other provisions. The first requires agencies to disclose information automatically by publishing it in the *Federal Register*. Information that must be disclosed includes descriptions of agency organizations, functions, and procedures; substantive agency rules; and statements of general agency policy. The second requirement is the reading room provision of FOIA. Final agency opinions and orders rendered in the adjudication of cases, specific policy statements, certain administrative staff manuals, and some records previously processed for disclosure must be made available in agency reading rooms. Some of these disclosed documents must also be posted in an agency’s electronic reading room. Failure to disclose some types of information precludes agencies from enforcing or relying on them.

LEGISLATIVE HISTORY

Varying proposed pieces of freedom of information legislation were prepared and debated in Congress

for over a decade before the final bill was passed. An early advocate of freedom of information laws, Senator Thomas C. Hennings, Jr. (D-Missouri), referring to a proposed freedom of information legislation, noted that: “The aim . . . of this bill . . . is to make it clear beyond any doubt that the basic purpose of this section is to insure the dissemination of the maximum amount of information reasonably possible.”^[6] FOIA, which amended the Administrative Procedure Act of 1946, was passed on July 4, 1966 and went into effect in 1967.

Since the initial law was passed, a series of amendments have modified the statute. Some changes strengthened the statute while others weakened the reach of the law with regard to access of government. The first series of major amendments came in 1974 in the wake of the presidential Watergate scandal. These amendments significantly strengthen the reach of FOIA disclosures. A little more than a decade later in 1986, another series of amendments were passed by Congress during the Reagan administration. These changes weakened access to government afforded through FOIA by expanding the exemption for law-enforcement documents.

The last major set of amendments came in 1996 and are referred to, collectively, as the Electronic Freedom of Information Act or E-FOIA. These amendments brought FOIA into the Internet age. Electronic documents are now accessible through FOIA requests, and agencies are obligated to proactively post their most frequently requested documents in their electronic reading rooms. In 2002, the Homeland Security Act was passed which also included an amendment to FOIA. Senator Patrick Leahy (D-Vermont) called this amendment the “most severe weakening of the Freedom of Information Act in its 36-year history.”^[7] The Homeland Security Act amendment exempts all information deemed related to homeland security which corporations voluntarily disclose to the Department of Homeland Security. This is a very broad exemption that ensures the department will keep the disclosed information secret and allows companies to be free of potential civil liability and antitrust lawsuits if the information indicates wrongdoing.

HOW DOES FOIA WORK?

Essentially, FOIA is a disclosure statute. All agency records are accessible to the public unless specifically exempt from disclosure. Documents, not information, are requested and released under FOIA. This is a meaningful distinction. One cannot request the federal government to make a report or compile and summarize information. Under FOIA, one can only request preexisting agency records. There is no clear definition

of what is an agency record. Typically, documents must be in control of the agency from which they are requested. After the 1996 E-FOIA amendment, electronic files may be requested and will be released in electronic form. Prior to the 1996 amendments, databases released to requesters would usually have been printed and sent in hard-copy form. Currently, requesters may receive data sets electronically in the electronic format of their choosing. Generally, e-mails are considered agency records although the line between agency and personal records is at times blurred. For a comprehensive discussion of relevant case law, see *Litigation Under the Federal Open Government Laws 2002: Covering the Freedom of Information Act, the Privacy Act, and the Government in the Sunshine Act, and the Federal Advisory Committee Act*.^[8]

Virtually, anyone can make a FOIA request including U.S. citizens, foreign citizens, corporations, and governments. FOIA is a disclosure statute, meaning it opens up documents in the federal government for release. With that said, there are nine exemptions written into FOIA:

1. National security information.
2. Internal agency rules.
3. Information exempted by other statutes.
4. Business information.
5. Inter- and intra-agency memoranda.
6. Personal privacy.
7. Law-enforcement records.
8. Records of financial institutions.
9. Oil well data.

Most of these exemptions are discretionary; that is, if a document falls under one of the exemption categories, then the federal agency has the option whether to release the document or not. However, the first exemption is not discretionary. Documents that have been classified for national defense or foreign policy are not releasable. Documents that are properly classified are not appropriate for a discretionary disclosure. The second exemption refers to documents which relate to internal personnel rules and practices. Documents falling under exemption 2 may be discretionarily disclosed. The third exemption is one of the broadest. If documents are exempt from disclosure through another statute, then they are also exempt under FOIA and cannot be discretionarily disclosed. Examples of statutes that exempt the release of material include the Department of Homeland Security Act, the Immigration and Naturalization Act, the Federal Aviation Act of 1958, and the Ethics in Government Act.

Trade secrets and business information are exempt from release through FOIA by the fourth exemption and rarely are discretionarily disclosed. At times,

Fig. 1 Overview of generic FOIA process. (U.S. General Accounting Office (2002). *Information Management: Update on Implementation of the 1996 Electronic Freedom of Information Act Amendments* [GAO-02-493]. Washington, DC: U.S. General Accounting Office, p. 5.)

corporations or businesses seek to prevent the release of information gathered by an agency to a third party. These challenges are referred to as “reverse” FOIA litigation. Documents such as inter- or intra-agency memos regarding predecisional policy formation are covered under exemption 5. Documents falling under exemption 5 may be discretionarily disclosed. Individual’s personnel or medical files are not releasable because of the privacy exemption, number six, and generally not deemed appropriate for discretionary disclosures. The law-enforcement provisions, which were strengthened by the 1986 amendment, are covered under exemption 7. Records dealing with financial institutions and oil wells are covered by exemptions 8 and 9, respectively. Documents falling under exemption 7, 8, or 9 may be discretionarily disclosed.

To make a FOIA request, one must send a written request to the individual agency you would like to release the documents. This can be carried out either by the mail or, increasingly, by fax or e-mail. It is essential that you write to the correct agency and you are as specific as possible about your request. There is a wealth of good references on how to write a FOIA request. The U.S. House of Representative Committee on Government Reforms publishes *A Citizen’s Guide to Using the Freedom of Information Act and the Privacy Act of 1974 to Request Government Records*. This report is linked to the committee’s homepage: <http://www.house.gov/reform>. A summary of the steps a FOIA office takes to fill a request are presented in Fig. 1.

However, not all requests are filled. If a request is denied, either in full or in part, the requester has the right to appeal. Frequently, appeals are settled informally by the agency and never make their way to court. Judicial remedy is the last recourse, however.

By law, agencies are required to make a determination on a FOIA request within 20 working days. Agencies are also required to make a determination on administrative appeals within 20 working days of

receipt of the appeal. Many agencies do not meet these requirements and some have construed the 20 days as the time frame within which the request needs to be acknowledged. This was not the intent of the law. Agencies frequently do not meet the statutorily prescribed timelines and subsequently have large backlogs of unfulfilled requests. Some agencies have requests that are years old. The 1996 E-FOIA amendments attempted to address this issue by setting up a multi-track processing system. Instead of a first-come first-serve basis, they now have a system where simple requests are filled within the order they are received and complex requests are put into a different queue.

Agencies can charge requesters for the direct costs associated with searching for documents, the direct costs associated with reviewing documents to determine which portions are releasable, and the duplication costs. Depending on the category of requester, all, some, or none of these fees may be charged. Review, search, and copy charges are set by the Office of Management and Budget. Certain categories of requesters can apply and receive fee waivers. Individuals or organizations that fall under the category of public interest groups, representatives of the news media, or educational or non-commercial scientific organizations may receive these waivers. Fee waivers are also granted to any requester who can show that the disclosure of the information is in the public interest and will likely contribute to public understanding of governmental operations and activities.

CONCLUSION

Implementation of the Freedom of Information Act is a complex process. Inherent in this process are multiple tensions. The first tension is between efficiency and transparency. FOIA is expensive and FOIA offices are periodically underfunded. FOIA functions are not associated with the missions of most federal agencies.

When budgets are tight, it is essential to continue funding non-mission-based functions such as FOIA.^[9] Budgetary constraints are a major impediment to FOIA implementation. Statutorily FOIA requests must be filled and lack of funding does not absolve this responsibility. Most agencies have significant backlogs of unfilled requests and requests may take years to be filled. Requesters have little recourse for delayed filling of requests other than litigation.

The tension between privacy and transparency is perennial. Privacy advocates consistently want to decrease the amount of information that can be released with regard to personal privacy, while other groups of people, such as journalists, may push for greater release of personal information. Other areas of tension include national security, homeland security, and business information. These tensions are inherent in any freedom of information law and are most likely never going to be resolved. The need to periodically strike new balances among FOIA's major concerns is not necessarily a problem. Competing interests will help shape the nature of future Freedom of Information Act amendments.

Futures and Options

Greg Chen

*School of Public Affairs, Baruch College, City University of New York,
New York, New York, U.S.A.*

INTRODUCTION

Like stocks and bonds, futures and options are financial instruments that are traded in exchange markets across the world. Unlike stocks and bonds, however, futures and options are derivatives whose value depends on the values of their underlying assets.

Futures and options serve important functions in the financial market. They provide the opportunity for hedging and speculation. Futures and options are a growing field in financial market. This is mainly due to the increasing volatilities in financial and commodities markets over the past decades.

This paper discusses the concepts and practices of futures and options in the financial market. It also introduces briefly the basic principles and the key models in option pricing, i.e., the binomial model and the closed form Black and Scholes model.

FUTURES AND FUTURES MARKETS

Futures are exchange-traded derivatives, representing agreements to buy or sell some underlying assets in the future for specified prices. Futures trade on a variety of underlying financial assets and commodities, including stocks, stock index, foreign exchange, gold, wheat, oil, live beef, etc.

Futures markets have a long history. They were initially developed to meet the need of farmers and merchants. The Chicago Mercantile Exchange (CME) was established in 1919. It is the most significant futures market in the world. Futures are also traded in many exchanges in many countries. Among the major ones are the London International Financial Futures Exchange, the Tokyo International Financial Future Exchange, Bolsa de Mercadorias Futuros in Sao Paulo, and the Swiss Options and Financial Futures Exchange, to list just a few.

The futures market in United States is regulated by the Commodity Futures Trading Commission (CFTC), an independent agency of the U.S. government. The market is also subject to regulation by the National Futures Association (NFA), a self-regulatory body authorized by the U.S. Congress and subject to CFTC supervision.

The futures exchange has a clearinghouse function. The clearinghouse is responsible for clearing trades

and for day-to-day settlement. This means the clearinghouse records all of the trades made through the exchange each day. At the end of the trading session, the clearinghouse matches or reconciles contracts bought and sold.

The participants in the futures market are mostly hedgers and speculators. A hedger tries to minimize risk by buying or selling now in an effort to avoid rising or declining prices in the future. Conversely, the speculator tries to profit from the risks by buying or selling now in anticipation of rising or declining prices.

The gains and losses in a futures contract are settled daily by a process called marking to the market. The broker transfers that amount from the trader's margin account to the clearinghouse when faced with loss. The clearinghouse transfers that amount to the broker, who then deposits it into the margin account, when there is a gain. Through this daily margining process, futures settle every day. This means that obligations under the futures contract are satisfied every day on an ongoing basis as mark-to-market profits or losses are realized. This essentially eliminates credit risk for futures.

It should be noted that futures trading is highly leveraged. This means that the profit gains and losses are large in comparison to the change in the underlying assets and relative to the initial margin that the traders deposit. For example, suppose the futures prices for S&P 500 is \$1100. Given that each S&P 500 is a multiple of \$250, the nominal value of a contract is $250 \times 1100 = \$275,000$ dollars. As normally requested, a 10% margin is deposited for the contract. Assuming that the next day, S&P 500 drops just by 5% to 1045, the long position loss is, however, $(1100 - 1045) \times 250 = \$13,750$, representing a 50% loss of the total margin deposit for the long term position holder. This example indicates that futures trading is risky as it is highly leveraged. Due diligent and substantial training is usually required to be successful in the futures market.

FUTURES PRICING

The price of a futures contract can be derived either from the time-value of money principle or from arbitrage arguments.^[1] From the time value of money viewpoint, the futures price represents the future value of prepared forward price of the underlying asset.

The exact expression of the futures price depends on the underlying assets and presence of yields. If the underlying asset does not generate yields, the price of a futures contract can be expressed as

$$F_{0,T} = S_0 e^{rT} \quad (1)$$

where $F_{0,T}$ is the futures price of a stock today that is to be delivered at time T , S_0 is the spot price today, T is the time until delivery date, and r is the risk-free interest rate for maturity T .

If the underlying assets do generate an average yield, the futures price becomes

$$F_{0,T} = S_0 e^{(r-q)T} \quad (2)$$

where q is the average yield during the life of the contract.

These pricing models can be also viewed from the arbitrage-free principle. In an efficient market, a futures contract is so priced as to preclude arbitrage profit. In other words, investors will be indifferent to spot and futures market to execute their buying and selling of underlying assets because the prices they obtain are effectively the same.

OPTIONS AND OPTIONS MARKETS

An option is a contract that gives the buyer the right, but not the obligation, to buy or sell an underlying asset at a specific price on or before a certain date. The underlying assets for options include financial assets and commodities, such as stocks, bonds, currencies, commodities, oil, corn, and orange juice. The options are traded in options markets across the world. The most prominent options market in the United States is CME in Chicago.

Options fall under two main categories, the call option and the put option. A call option is a right to buy a certain asset by a certain date for a certain price. A put is an option to sell a certain asset by a certain date for a certain price.

People who buy options are called holders and those who sell options are called writers. As in the stock market, the buyers are said to have long positions, and sellers are said to have short positions.

The price at which an underlying stock can be purchased or sold is called the strike price. This is also called striking price or exercise price. This is the price at which a stock will be sold when the option holders opt to exercise the option. All of this must occur before the expiration date.

As a right but not an obligation to purchase underlying assets at a predetermined price, an option has a value, which is called the option premium. Call and

put option premiums depend upon the stock price, strike price, time remaining until expiration (time value), interest rate, and volatility. The most important of these is the strike price of the option relative to the market price of the underlying futures contract. A call option becomes more valuable, and hence the premium becomes greater, as the market price of the underlying asset rises above the option's strike price.

The value in options can be classified into two categories, the intrinsic value and the time value. For call options, the option is said to be in the money if the share price is above the strike price. A put option is in the money when the share price is below the strike price. The amount by which an option is in the money is its intrinsic value. An option may or may not have intrinsic value, but it will almost always have time value. Any option may become valuable in the future and, hence, a liability to the seller, so the time value exists to compensate option sellers accordingly.

Two major types of options are traded in the exchanges, American options and European options. American options can be exercised at any time between the date of purchase and the expiration date. Most exchange-traded options are of this type. European options can only be exercised at the end of their life. They are less flexible than American options. Given their tighter structure, the pricing models to value European options are better developed. For this reason, a larger part of the discussion will be on European option pricing in the following section.

OPTIONS PRICING

There are two major option-pricing models that are widely published in the valuation of options, the discrete model and the continuous model. The discrete model is based on a binomial stock process model, developed by Cox, Ross, and Rubinstein.^[2] The continuous model assumes a geometric Brownian stock price motion, based on the landmark paper of Black and Scholes.^[3] Although both models are rooted in Black and Scholes' conception, we discuss the binomial model first, recognizing its intuitive appeal and pedagogical value.

Binomial Option Pricing Model

In the binomial model, the price of the underlying stock is assumed to take two, and only two, possible values. The extension of the binomial model creates the binomial tree, representing the stock price generating process and the result outcomes.

The option price is then derived from a complementary stock and bond portfolio, based on the non-arbitrage principle. The resulting equation for options

price and the definition formula for risk adjusted probability (1) are given in Eqs. (3) and (4).

$$C = [pC_u + (1 - p)C_d]/e^{rh} \quad (3)$$

$$p = [\exp((r - d) \times h) - d]/[u - d] \quad (4)$$

where C represents the value of the option, p is the risk-adjusted probability of an upward move, $1 - p$ is the risk-adjusted probability of a downward move, u is the multiplier for an upward move, d is the multiplier for a downward move, r is the risk-free rate per period, h is the length of a period, and d is the continuous dividend yield.

Specifically, there are two major steps in binomial modeling. First, the time to expiration of an option is broken down into potentially a very large number of intervals. At each interval, the stock price is allowed to move up or down by an amount calculated using volatility and time to expiration. This produces a binomial distribution tree, or recombining tree, of underlying stock prices. The binomial tree represents all the possible paths that the stock price could take during the life of the option. The process works from the present to future expiration. At the end of the tree, i.e., at expiration of the option, all the terminal option prices for each of the final possible stock prices are known, as they simply equal their intrinsic values.

Second, the option prices at each step of the tree are calculated by working back from expiration to the present. The option prices at each step are used to derive the option prices at the next step of the tree using risk neutral valuation based on the probabilities of the stock prices moving up or down, the risk-free rate, and the time interval of each step. Any adjustments to stock prices or option prices are worked into the calculations at the required point in time. At the top of the tree, we are left with one option price.

The binomial model is easier to understand intuitively. It provides an approximation of the more math-intensive continuous model. Another advantage of the binomial model is that it can be used to accurately price American options, which is not available in the closed form of the more accurate continuous model. This is because with the binomial model, it is possible to check at every point in an option's life (that is, at every step of the binomial tree) for the possibility of early exercise.

Black–Scholes Option Pricing Model

The Black–Scholes option pricing model assumes that the underlying stock price follows a geometric Brownian motion with constant volatility. The change of option price is represented and restricted in a partial

derivative equation, the famous Black–Scholes partial differential equation.^[4,5] The solution to the equation is the Black–Scholes formula for options price. The Black–Scholes formula for the price of call option and put option are shown below respectively:

$$c = S_0N(d_1) - Ke^{-rT}N(d_2) \quad (5)$$

$$p = Ke^{-rT}N(-d_2) - S_0N(-d_1) \quad (6)$$

where

$$d_1 = \frac{\ln(S_0/K) + (r + \sigma^2/2)T}{\sigma\sqrt{T}}$$

$$d_2 = \frac{\ln(S_0/K) + (r - \sigma^2/2)T}{\sigma\sqrt{T}} = d_1 - \sigma\sqrt{T}$$

S is the price of the underlying stock, x is the strike price, r is the continuously compounded risk-free interest rate, T is the time in years until the expiration of the option, σ is the implied volatility for the underlying stock, and N is the standard normal cumulative distribution function.

The Black–Scholes option pricing formula prices European put or call options on a stock that does not pay a dividend or make other distributions. An example of the application is presented in the next section.

EXAMPLE OF OPTION PRICING BY BLACK–SCHOLES MODEL

Consider a European call option on 100 shares of non-dividend-paying stock XYZ. The option is struck at \$40 and expires in three months ($T = 0.25$). XYZ is trading at \$41 and has 30% ($\sigma = 0.30$) implied volatility. The continuously compounded risk-free interest rate is 0.03. Applying Eq. (5), the call option's market value per share of XYZ can be calculated at approximately \$3.06. Since the call is for 100 shares, its total value is \$306.

Game Theory

Michael A. Kelley

Department of Social Sciences, Pittsburg State University, Pittsburg, Kansas, U.S.A.

INTRODUCTION

Game theory is a mathematical approach to individual decision making that employs games as paradigms of rational decision-maker interactions. Used to study a variety of social, economic, and political issues, such as arms races, legislative coalition formation, military strategy, regulative public policy, voting behavior, and even aspects of marriage, game theoretic models delineate those decisions actors should make when confronted with competing policy alternatives or decision consequences. Far from seeing games as trivial, game theorists posit that game decisions exhibit the same rules or forces that drive more complex political and other social interactions and outcomes. After all, games, like politics, involve player moves and interactions, selection of strategies with specific consequences, and, at times, coalition formation, all predicated on a desire to maximize individual player interests.

POSITIVE POLITICAL THEORY AND THE RATIONALITY ASSUMPTION

Intrinsic to game theory is the idea that individual decisions are rational, i.e., individuals are engaged in purposeful action directed at ordered goal attainment. Positive political theory asserts that individuals order their goals when engaged in public choice, choosing to maximize their expected utility and preferring to win or gain rather than lose or fail to gain when there are real conflicts of interest. Indeed, enforced policy choices by government are the result of socially expressed, ordered, and calculated preferences for particular policies. The idea of rationality and the resulting regularity in human behavior explicates a positive science of politics that encourages the confrontation of assertion with experimentation and tests of validity.

Game theory, which employs games as abstractions of real-world situations and assumes player rationality, assigns specific mathematical payoffs to decision situations. It delineates the appropriate strategy rational players will pursue given a particular game and given that players maximize gains and limit losses when confronted with a decision or problem. There is the further

expectation that other players in the game will behave similarly in order to maximize their own individual utility, when there are competing policy alternatives. Games, thus, are heuristic devices in that they simplify reality based on particular assumptions in order to provide insights into human conduct.

Game theory involves decision problems, where there are at least two parties, and players must choose among competing decision alternatives with particular consequences, consistently order their preferences based on decision consequences and where the consequential interaction of player choices can be specified mathematically. Example 1 exemplifies these points and illuminates the assumption of rationality.

Example 1

"Polluter versus Regulator"

<i>Polluter</i>		<i>Delay (A)</i>	<i>Comply (B)</i>
<i>Regulator</i>	<i>Intensive (A*)</i>	8; -8 (A*; A)	5; -5 (A*; B)
	<i>Less Intense (B*)</i>	1; -1 (B*; A)	3; -3 (B*; B)

In this situation, the regulator confronts a polluter with a set of new rules. Row A* provides for more intensive regulative monitoring, with positive payoffs (fines collected from polluter) of at least five units, and this is the regulator's dominant strategy in this game (payoff is always higher than another choice, i.e., $8 > 3$ and $5 > 1$); while row B* involves less monitoring and would permit more cheating by the polluter. The polluter, wanting to avoid cleanup costs, must choose between meeting the rules (column B) or choosing a strategy (column A) of doing only what is required after legal action. Polluter's choice is column B in this zero-sum game (what one player gets, the other loses), because the polluter wants to limit losses and assumes that a rational regulator will choose row A* to maximize the fines collected. With this choice, at most, polluter will lose five and could lose only three units, if the regulator fails to act rationally and selects row B*. The rational result would be a payoff of +5

units to the regulator and -5 units to the polluter (A^*B), but polluter avoids the -8 units consequence by pursuing a rational strategy of compliance.

EXAMPLES OF GAME SITUATIONS

Game theory is not only a mathematically based science of decision problems, it also is a classification scheme for games. As surrogates, games must reflect the complexity of real-world decision situations. Games are classified by the number of players ($2 \dots n$) and the types of outcomes (typically, zero-sum and non-zero-sum). Each game in the resulting game classification matrix has its own particular set of rules, which explain expected player choice relative to specified outcomes.

Two-Person, Zero-Sum Games

As seen in Example 1's highly conflictual situation, whatever one player wins, the other player loses, interests are diametrically opposed, player payoffs add to zero, and both antagonists possess perfect information about the consequences of their actions. Exemplified by wartime strategy, decisions in this game are based on the "worst-case assumption" or the idea that each player will seek maximal advantage. Assuming the worst, a *minimax* strategy, where regulator seeks to minimize the maximum amount of harm to interests in the face of Regulator's *maximin* choice of maximizing its minimum gain. In the example, a *minimax* strategy leads to the saddle point or optimal solution of A^*B or 5, -5 (the payoff that is a row minimum and a column maximum), in that this is the best that either player can do, given that each opponent is rational. In a zero-sum, two-person game there is always at least one pair of optimal strategies (if there is more than one set of optimal strategies, players are indifferent to any particular pair), hence, there is always a solution to the game.

Two-Person, Non-Zero-Sum Games

In these games, player interests are not diametrically opposed but rather have some shared interest in avoiding particular outcomes. An oft-used example of this game is the "Prisoner's Dilemma." As Example 2 illustrates, two prisoners charged with the same serious crime are separated and cannot communicate. The prosecutor can convict both of them of a minor crime but must get at least one of them to inform on the other in order to solve a more serious charge. During the interrogation, the prosecutor informs the separated prisoners that the one who informs will be set free, and

the other will spend 15 years in jail. If both cooperate and remain silent, they both spend 2 years in jail, while if they both inform on each other, they will each spend 7 years in jail. Which strategy should be pursued is the salient question, i.e., to maximize one's payoff or a strategy of trusting the other to remain silent. Prisoner 1's maximizing strategy would be such that: $B^*A > A^*A$ and $B^*B > A^*B$, hence, his rational strategy is to inform. Prisoner 2 rationally understands that $A^*B > A^*A$ and $B^*B > B^*A$ and also chooses to inform. Pursuit of individual rationality results in a 7-year prison sentence for each prisoner (B^*B). On the other hand, they would have served only 2 years each (A^*A), if they could trust each other to remain silent. The dilemma exists, because the rational choice of payoff maximization and the fear of the consequences of the other cheating results in a lower payoff than an alternative approach of trust, hence, the "Prisoner's Dilemma." This "game" is often used to describe why arms races occur even when cooperation would provide for a more satisfactory outcome for both parties.

Example 2

"Prisoners Dilemma"

Prisoner 2

		Quiet (A)	Informs (B)
Prisoner 1	Quiet (A^*)	$A^*; A$ 2; 2	$A^*; B$ 15; 0
	Informs (B^*)	$B^*; A$ 0; 15	$B^*; B$ 7; 7

N-Person, Zero-Sum Games

In these games, the zero-sum rules apply, but the distinction is that the winners are members of a coalition whose gain equals the losses suffered by those outside of the winning coalition, and where players can reach private agreements about the division of the spoils (side payments). The game's characteristic function (how much each possible coalition of actors can receive by acting in concert) will determine the game's outcome. Players taking into account the characteristic function will form coalitions that they believe are only large enough to win and which maximize their individual gains. This aspect of a game helps explain why it is so difficult to form and maintain "grand" legislative coalitions (see Example 3), because players can win more of the finite rewards if they form smaller coalitions. Indeed, empirical observation of grand alliance structures in domestic and international politics demonstrates that "grand" coalitions tend to form in times of crisis or discontinuity and then devolve into

Example 3*“Size Principle and Legislative Coalitions”*

In this simple game (where the characteristic function is either 1 or 0), the parties in a legislature want to control the government in order to appoint ministers but must form a coalition in order to win. Legislative strengths of the parties are as follows:

Party A = 45%
 Party B = 20%
 Party C = 25%
 Party D = 10%

The minimum winning coalitions (there is no majority if a member is subtracted) are AB, AC, AD, and BCD. It is possible to further refine the results by noting that A probably prefers AD to the other possibilities, because B and C will be more demanding, given their relative legislative strengths. D also prefers AD, because it will share the win with only one coalition partner or the smallest number of players. The AD coalition is the one likely to emerge, if there are no ideological or information problems that lead to larger than minimal winning coalitions.

competing parties or smaller coalitions when the crisis has passed.

N-Person, Nonzero-Sum Games

This game is most relevant to political and administrative decision making, the central aspect of which is coalition formation, where the benefits of cooperation outweigh those of maximizing individual utility. In these games, where constant communication occurs over many different decisions, cooperation can bring

positive payoffs, while noncooperation provides no increase in individual utility. In the $N = 4$ example (Example 4), the question is, when will an individual support a fee, if the levy will generate a desired public value twice as great as the total costs to the individual players. While each person would prefer to receive benefits at no cost, because there is communication, players are more likely to prefer to win something than pursue an individually rational strategy that would result in no individual benefit. After all, players prefer to win something than forego winning at all. A coalition will form if the players receive a benefit

Example 4*“Community Good”*

Agree	Individual Cost	Total Cost	Community Good	Individual Benefit	Individual Gain	Cell
Yes—4 No—0	\$40 \$0	\$160	\$320	\$80	\$40	A
Yes—3 No—1	\$40 \$0	\$120	\$240	\$60	\$20 \$60	B
Yes—2 No—2	\$40 \$0	\$80	\$160	\$40	\$0 \$40	C
Yes—1 No—3	\$40 \$0	\$40	\$80	\$20	-\$20 \$20	D
Yes—0	\$0				\$0	E

The most likely result is Cell C. In Cell E, no one gains anything; while in D, it is unlikely that a single player will solely finance the public good. On the other hand, there is a benefit to defect (compare individual gain in Cell B and Cell A) from the grand coalition. However, if a player can convince just one other person of the levy's value, there is no cost relative to the received and desired benefit (Cell C). A minimal coalition can be formed to acquire the desired good, provided it is profitable (or does not cost) the players.

or there is no cost associated with receiving the public good.

CONCLUSION

The idea that individuals are rational gives social scientists a powerful mechanism with which to understand various forms of political and social decision making. The theory of games assumes that decisions are not randomly derived but rather are arrived at through a process where each player seeks to maximize positive rewards relative to costs in situations when there are competing perspectives. Games, with their specified outcomes relative to particular decision problems, permit decision-making theorists to look at real decisions in a predictive or evaluative mode. The predictive mode allows for the delineation of a strategy relative to an expressed set of ordered goals, with the presumption that rationality compels particular procedures and results. On the other hand, the evaluative approach infers from actual decisions the goals which must have existed under the rationality assumption to lead to the

particular result. Games are not perfect analogies to real-world decision making, yet the use of games allows us to test to see if decision makers behaved in a purposeful and ordered fashion to maximize individual utilities.

Gaza Disengagement: Israel Government Forced Resettlement (2005)

Nitza Nachmias

School of Political Science, University of Haifa, Haifa, Israel

INTRODUCTION

Former Israel Prime Minister Ariel Sharon introduced the plan to “disengage” from the Gaza Strip to the Israeli government in early February 2004, at the peak of international criticism of Israel’s project of the separation wall and of Israel’s military operations in Gaza and the West Bank. The plan received the blessing of the Quartet, a political forum consisting of representative of the US, EU, UN, and Russia, that pledged generous funds for a rehabilitation program of Gaza. The Israeli government assumed responsibility for the proper resettlement of the Gaza evacuees. The termination of Israel’s 40-year occupation of Gaza was expected to greatly benefit both Israel and the Palestinian Authority.

On August 5, 2005, Israeli army and police units launched a three-day unilateral military campaign, relocating about 10,000 settlers (some 2000 households) to temporary homes inside Israel. The Palestinian authority was not a party to the project, but tacitly cooperated and planned to assume full control over the evacuated territory. During the operation, the settlements houses and infrastructure were razed to the ground.

However, the outcome of the Disengagement was very disappointing and disturbing to both Israel and the Palestinian Authority. In August 2007, two years after the pullout, most of the Israeli evacuees have been still living in temporary housing and many families have not found suitable employment. The children especially experienced a hard time and their school achievements have declined. In Gaza, economic and political conditions deteriorated drastically in the wake of the 2006 Hamas election victory that resulted in an international boycott. Clearly, the Disengagement operation that began with good intentions ended with doubtful results.

DISENGAGEMENT AND FORCED RESETTLEMENT DEFINED

This article defines “disengagement” as an act of departure, a release from an attachment and a separation

from people or places of friendliness. “Political Disengagement” implies a withdrawal, a pullback, and a pullout from a political conflict. “Strategic Disengagement” denotes a break off a military action with an enemy.^a The Gaza Disengagement included social, political, and strategic departures. The Israel military lost control over strategically sensitive border, while the settlers lost their homes and saw their social and economic infrastructures ruined. In legal terms the evacuees became “internally displaced persons” (Table 1).

International law distinguishes between people who are “refugees”, namely, people who fled their homes and sought refuge in a foreign country for fear for their lives, and “Internally Displaced Persons” (IDPs), who also fled their homes for fear for their lives but remained within their own borders^[1]. Unlike refugees, IDPs are not protected under the refugee’s convention of 1951 and are left at the mercy of their own government, often the government that caused their displacement. The Israel government appropriated \$2.2 billion for the resettlement of the Gaza IDPs,^b however, the results have been less than satisfactory.

The final definition of the Disengagement that was reached with the mediation of the Quartet was: 1) Israel would transfer to the Palestinian Authority (PA) the full control of the Gaza Strip and 2) would lift the closures of Gaza and the border with Egypt. In return, the PA would 1) stop all anti-Israeli violence from Gaza, and 2) would end the shelling from Gaza of cities in southern Israel. The compromise was perceived to benefit the security and well being of both sides.

STRATEGIC, ECONOMIC, AND POLITICAL DILEMMAS

Israel security concerns focused on the three main issues: 1) border crossings from Egypt to Gaza, 2) border

^aThe author’s interpretation of various sources.

^bOne-third of the aid would help defray expenses associated with the redeployment of Israeli military bases and troops following the pullout from Gaza. The remaining two-thirds would be used to develop Israel’s Galilee region in the north and the Nitzan region in the south, areas where the evacuated settlers will be resettled.^[2] The Israeli Disengagement Law passed on February 16, 2005.^[2]

Table 1 Gaza strip population

Total population	Gaza City (incl. Jews)	Population estimates +10%
1949	80,000	200,000
1967	118,000	356,000
1996		963,000
2005		1,400,000

[From UNRWA data; PA projections (1997); FAFO; www.jewishvirtuallibrary.org.]

crossings from Gaza into Israel, and 3) the smuggling of weapons and fighters from Egypt into Gaza. The U.S. Secretary of State, Condoleezza Rice, was actively and personally involved in finalizing an agreement that would alleviate Israel's security concerns. The compromise was that Egypt and the PA would control the crossing and Israel would review the traffic on video cameras in real time. Israel would also receive lists of individuals and goods using the crossing. Palestinian convoys to the West Bank would require Israeli military escorts. Finally, Israel would continue to control the Gaza coast and skies.

The most contentious issue was the control of the southern Gaza Strip–Egyptian border, a 14 km, 50–100 m width “Philadelphi Route” (an Israeli code name). Israel knew that a complex network of underground tunnels existed and used to smuggle illegal weapons, drugs, and fighters from Egypt into Gaza. Israel rightly questioned the Egyptian military capability to control the strategic Philadelphi Route, namely, its ability to prevent the illegal underground activity. Indeed, the 750 Egyptian troops who were deployed along the border, and the 70 unarmed European Union policemen and border experts who supported them, were unable to effectively fulfill their strategic and tactical missions.^c On September 12, 2005, the Israel Defense Forces (IDF) completed their military pullout and were redeployed behind the Philadelphi Route. Israel erected a heavy fortification system along the border and the movement of people and goods was monitored via video cameras in real time. Regrettably, the tunnel activities have never stopped, and the IDF has been constantly blowing up old and new tunnels along the Gaza border with Egypt. For example, on October 8, 2006, Ynet news quoted Israel intelligence estimates that 7500 terrorists with large quantities of advanced missile hardware have entered Gaza after the Disengagement.^d Israel also claimed that Al-Qaeda

members began to infiltrate Gaza through the underground tunnels.

The PA was equally disappointed from the results of the Disengagement. The Quartet's hopes for an economic revival of Gaza were dashed. The Quartet's special envoy, James D. Wolfenson, former Director of the World Bank, labored incessantly to ensure the peaceful transition of the economic and agricultural assets from the Jewish settlers to the PA. He planned mutual industrial zones, trade, transportation continuity between Gaza and the west Bank, and the peaceful transformation of the settlers' greenhouses, valued at \$U.S. 14 million to the PA. Wolfenson's initial optimism was soon replaced with deep frustration. The economic and political conditions in Gaza deteriorated while Israel did not relinquish its control of the Gaza air and the seaports. Israel argued that as long as the rocket attacks on its southern townships continued and terrorist groups were allowed to operate openly and freely in Gaza, it would not lift the air and sea closures. The victory of the terrorist organization Hamas in the 2006 Palestinian elections was perhaps the final nail in the peace process coffin.

THE UNREALISTIC GOALS OF THE DISENGAGEMENT

The Disengagement plan included an elaborate list of both realistic and unrealistic strategic, economic, and political goals.

1. *Strategic goals*: 1) relocate all the settlers to other areas, 2) remove all IDF outposts and installations from the Gaza Strip and Northern West Bank, 3) reduce the military force manning checkpoints throughout the West Bank, 4) encourage the PA to fight terrorism, 5) continue the building of the West Bank barrier, and 6) continue to control Gaza air and coastal waters.
2. *Political Goals*: 1) revive the 2003 Quartet's Road map for peace, 2) reduce friction between Jewish Israelis and Palestinian Israelis, 3) absolve Israel of legal responsibility for Gazan Arabs, and 4) gain international support of Israel foreign policy.
3. *Economic goals*: 1) renew and increase trade with Egypt and the PA, 2) improve the Gaza and the West Bank economies, e.g., the greenhouses were expected to yield over \$50 million

^cThe “EU Police Mission for the Palestinian Territories” (EUPOL-COPPS) is a group of about 70 advisors who were dispatched to Gaza on January 1, 2006 with a mandate of 3 years (EU13696/05). Major-General Pietro Pistolese of Italy heads the mission.

^dThere now appears to be substantial evidence that al-Qaeda has acquired a limited but growing presence in Gaza. This presence seems to have increased since disengagement.^[3]

per year, and 3) improve the movement of people and goods to and from Gaza.

ACTUAL RESULTS

The Disengagement hardly achieved its goals. First, while Israel did not freeze all settlement activity, the PA never stopped or even reduced the violence against Israel. Second, the economic conditions in Gaza greatly deteriorated, and the Quartet shelved all the plans for the economic reconstruction of Gaza. The 2005 World Bank report showed a 40% decline in the Palestinian GDP, while PCI declined by 26.4%.^c Third, Israel's security was not enhanced. In fact, attacks on Israeli southern townships from Gaza intensified, and underground smuggling activities increased. Israel retaliated by launching air strikes and military land attacks and imposing severe and frequent closure and travel restrictions on Gaza and the West Bank.

Additional unpredicted adverse results were:

1. The final cost of the Disengagement greatly exceeded all estimates. The original budget of 3 billion NIS was revised several times, to 4.3 billion NIS, or about \$1 billion,^[4] and later to about 8–10 billion NIS, or \$2 billion.
2. The resettled families have been experiencing severe social and psychological problems, unemployment, increased juvenile delinquency, high school dropouts, and severe shortages of permanent housings.^[5]

P3: POLITICS, PROCEDURES, PROCESSES

Politics

Prime Minister Ariel Sharon launched his surprising political and strategic initiative on December 18, 2003, in a speech at an academic conference. "The purpose of the Disengagement Plan is to reduce terrorism as much as possible, and grant Israeli citizens the maximum level of security. The process of disengagement will lead to an improvement in the quality of life, and will strengthen the Israeli economy. The unilateral steps will be fully coordinated with the United States."^f The essence of the pullout was 1) to shift wasted resources from Gush Katif to the West Bank settlements, 2) to reduce friction and hostilities in

Gaza, 3) to negotiate a settlement on the West Bank on more favorable terms, and 4) to provide the IDF with a free hand to operate against terrorists in Gaza. Sharon needed the support of the United States to his unilateral plan, and in early April 2004 he traveled to Washington. He returned with four major promises: 1) a letter from President Bush supporting the unilateral Disengagement,^g 2) a tacit promise to back Israel policy on major issues to be negotiated in any future peace agreement, 3) the Palestinian refugees would be settled in the future Palestinian state and Israel would not be responsible for their "right of return", and 4) the United States recognizes Israel security need for a temporary security fence. The Bush letter caused a fury in the Arab world, especially the "right of return" clause and the tacit recognition of the settlements in the West Bank.

Procedures and Processes

The Disengagement plan encountered strong opposition among the leadership of Sharon's own Likud party, who even called for his removal from office. Sharon underestimated the opposition and called for a referendum, on May 2, 2004, of all registered Likud voters. To Sharon's dismay 65% of the 193,000 Likud members voted against the Disengagement. The opponents' arguments were twofold: 1) Gush Katif was necessary to protect Israel's border with Egypt and to prevent terrorist infiltration into Israel, and 2) Israel has a historical/biblical claim to the land. Sharon prevailed, and the Israel Cabinet approved, on June 6, 2004, (14–7) the Disengagement plan with the "yes" vote of the Labor opposition and other smaller parties. The second hurdle was the vote in the Legislature. On October 11, 2004, at the opening of the Knesset winter session, Sharon introduced the Disengagement Law that would appropriate large compensations to settlers' families, businesses, and public institutions. On October 26, the Knesset gave a preliminary approval for the plan with: 67 "yes", 45 "no", 7 abstentions, and 1 member absent. Sharon labored over 6 months to build a coalition of "enemies" namely, Likud; Labor; and the center party Shinui. Using the "carrot and stick" tactics Sharon approved the allocation of \$67 million to the United Torah Judaism party for its religious schools in exchange for five votes; the Labor party received about \$140 million for 19 of its 21 votes; and the secular Shinui party received \$163 million to secure the "yes" vote of its 14 Knesset members. Sharon overcame the final legislative hurdle and on February 16, 2005, the Knesset finalized

^cThe 2005 World Bank report showed a 40% decline in the Palestinian GDP during the first 3 years of the Intifada, while the PCI declined by 26.4%.

^fSharon speech before the Fourth Hertzeliya Conference, organized by the Center for Interdisciplinary Studies, 12.18.2003.

^gPresident letter to Sharon dated April 14, 2004.

Table 2 Cost of disengagement compensations

Payments to settlers	Original estimate	Revised/2005	Total
Homes/loss of livelihood	1.6 billion NIS	2.4 billion NIS	
Business compensations	1.0 billion NIS	1.4 billion NIS	
Public institutions	0.3 billion NIS	0.5 billion NIS	
Average family compensation	1.25 million NIS	1.7 million NIS	4.3 billion NIS

Source: Ha'aretz daily, February 16, 2005.

Note: On September 20, 2005, compensations were increased by 15% to about 2025 million NIS per family. The total cost of the compensations reached almost 9 billion NIS. Additional 135,000 NIS was offered as an incentive for resettlement either in the Galilee or in the Negev.

and approved the Disengagement Law with 59 in favor, 40 opposed, and 5 abstained.^[6] An opposition proposal to submit the plan to a national referendum was rejected (29–72). The Disengagement was scheduled for July 20, 2005 by a vote of 72–39. However, on June 9, 2005, the date for the evacuation was postponed to August 15, so as to not coincide with the Jewish commemoration of Tisha B'Av, traditionally a grief period for the destruction of the two Temples.

The opposition to the Disengagement organized massive anti-Disengagement campaigns, which included massive demonstrations by men, women, and children, who demonstrated along major highways and public places. The most confrontational action occurred on May 16, 2005, when protestors, carrying orange flags, symbol of the opposition to the Disengagement, blocked major intersections and highways. Notwithstanding the strong resistance to the Disengagement, the swift evacuation resulted in very few violent incidents. In total, 20 Jewish settlements: 16 in the Gaza Strip and 4 in Northern West Bank were dismantled and demolished. At the end of the day, 44 day-care centers, 36 kindergartens, 6 elementary schools, 3 high schools, 13 rabbinical Yeshivas, 38 synagogues, and a cemetery were evacuated and demolished. Undoubtedly, the Israeli society sustained an enormous emotional and economic cost.

It should be mentioned that about 66% of settlers, most of them secular, have accepted the compensation deals offered by the government^h and evacuated their homes prior to the deadline of August 15. The remaining hard-core, unrelenting, mostly orthodox families had to be forcefully evacuated. Complicating the evacuation was a group of about 5000 activists who illegally infiltrated the Gaza settlements over the weeks prior to the eviction date, violating the military order of March 17, 2005, prohibiting non-Gaza residents from relocating to that area. Only in a few cases of violent resistance the police had to carry out detentions and arrests.

Throughout the evacuation operation the Palestinians and Israel maintained an undeclared truce. Hamas and the other militant groups withheld their rocket attacks, while Israel refrained from air strikes and targeted assassinations. The joy of the Gazan people was clearly expressed by one resident: "The sun seemed brighter when it rose on the morning of Monday, September 12, minutes after the last Israeli soldiers left Gaza."^[7]

Ironically, Sharon, who had long been one of the architects of Israel's settlement expansion, had doggedly pursued and completed the forced resettlement of the most extreme group of settlers (Table 2).

GOOD INTENTIONS BUT POOR RESULTS

In February 2006, the Israeli Comptroller issued the most comprehensive review of the Disengagement. The review showed that while the intentions were right the results were poor:

1. The Sela bureaucracy was inadequate and lacked proper training.
2. Necessary coordination mechanisms with the security and the military forces were lacking.
3. Needed professional advisors in the field of agricultural relocation were not hired.
4. Social services were inadequate. Social workers were hired on a temporary basis.
5. The initial relocation of the 1750 families to their temporary housing was chaotic. The time needed for the construction of permanent housing was inaccurate. Consequently, hundreds of families were lodged for months in trailer-parks, hotels, and red-roofed mobile ("Car-a-villa") homes.
6. No adequate storage space was prepared for the goods and furniture of the evacuees.
7. The infrastructure of civil services necessary to accommodate the influx of the new settlers, i.e., education, health, etc. was not set up.
8. The appropriations for the resettlement were inadequate.

^hCompensation ranged from \$150,000–\$400,000 per family. Source: The Comptroller's report, February 2006.

9. Unemployment was hardly addressed. "Most of the residents (66%) worked where they lived...all are unemployed today. The rest 33% started their own private businesses."^[8] Additional 5365 billion NIS unemployment benefits were distributed in 2006, but the basic unemployment problem was not resolved.
10. The traumatic effects of the resettlement on children were not addressed. "Violence among the youth is high and rising. Drug abuse, which was negligible in Gaza, is on the rise... Children and youth have an almost psychotic fear of policemen and soldiers."^[8] The government approved \$1 billion additional funds for special assistance.^[9] However, the damage was done.
11. The report concluded that the poor management of the Disengagement traumatized the families and made it all but impossible for them to properly reconstruct their lives.

CONCLUSION

The Disengagement hardly answered the parties' expectations since it missed most of its political and strategic goals. First, the peace process suffered major adverse consequences. Mutual hostilities increased and both Egypt and the PA were either incapable, or unwilling to stop the underground traffic of weapons and fighters into Gaza. Second, Israel's assumption that the pullout would enhance its security was a wishful thinking. The electronically smart surveillance system that Israel had installed along the border to replace its military posts, proved useless. In fact, terrorist activities continued unabashed while the rocket attacks on Israel's Southern cities did not stop either. Third, the Palestinians resented Israel's intermittent military operations in Gaza and its continued control of the Gaza sea and airports. Fourth, the success of the Hamas in the 2006 Palestinian elections and their subsequent declarations denouncing all peace possibilities with Israel created dire economic conditions in Gaza. The United States and the European Commission

withheld economic assistance to the Hamas government, while Israel maintained the closures of the Gaza borders. Tougher restrictions were imposed on the movement of goods and people from and to the West Bank, and prospective income from the greenhouses did not materialized. Fifth, the humanitarian crisis in Gaza accelerated. All the Gaza reconstruction projects planned by the World Bank were shelved. Among them: rehabilitation of 100 km of Gaza roads; building of 2000 new housing units; installing 85 km of new water pipelines; reconstruction of sewerage network to 15,000 households; construction of up to 560 new classrooms; and construction of 45 new health clinics.^[10]

Finally, the physical and emotional cost of the Disengagement to the Israeli society was grossly underestimated. In fact, the entire Israeli population experienced the traumatic effects of the forced resettlement. The Disengagement was not a success story for the Palestinian community either. Perhaps the sole achievement of the Disengagement was the termination of the Israeli occupation of Gaza.

Gender and Public Administration

DeLysa Burnier

Department of Political Science, Ohio University, Athens, Ohio, U.S.A.

INTRODUCTION

Gender writing and research in American public administration typically begins with a description of the organizational reality facing women in the public sector. Among the facts regularly cited in such a description are that women lack parity with men in the workforce at all government levels. Women are concentrated in the lower levels of the civil service and in occupations designated historically as female; and they are underrepresented in state and federal governments' upper management ranks. Women remain underpaid relative to men, and "glass ceilings" continue to block progress up the professional ladder, despite years of public policies aimed at creating workplace equality.

Explicating the political, economic, and cultural elements of this reality with the aim of changing it has been one task of gender scholars. A second task has been to establish gender as an analytic category within public administration. The gender scholarship produced thus far is an evolving body of methodologically and theoretically diverse work that rests on two seminal texts: Kathy Ferguson's *The Feminist Critique of Bureaucracy* and Camilla Stivers' *Gender Images in Public Administration*.^[1,2]

For many reasons, gender scholarship has been slow to make it into public administration textbooks, journals, and classrooms. This entry's purpose is to bring the gender perspective into focus for public administration scholars unfamiliar with it. First, it will describe briefly feminist/gender theory. Second, it will highlight the contributions public administration gender scholars have made in the areas of history, theory, and practice. Third, it will propose a care-centered conception of public administration.

FEMINIST/GENDER THEORY

Feminist theory can be described variously, but three approaches generally have been used to address the issue of gender difference and inequality. The first approach is liberal feminism, which denies or dismisses the importance of sex-based differences. Perceived sex differences, whether biological or social in origin, provide no valid ground for denying women the rights and privileges accorded to men. This approach relies on the

liberal concepts of procedural justice, rights, and equality. It seeks to expose gender biases, challenge traditional sex roles, and implement institutional and legal reforms until women become fully equal to men.

The second approach, difference feminism, recognizes the importance of equality while embracing the differences that exist between men and women. The issue is not that gender differences exist, but that those qualities and experiences typically associated with women have been devalued. Because of their experiences as childbearers, mothers, and caregivers, and their knowledge of what it means to be powerless, women have developed important capacities to connect, nurture, and empathize with others. Out of these experiences, women have developed alternative "ways of knowing" based on emotion, empathy, and intuition.

The third approach, drawing on postmodernism, centers on the gender differences between women. The dualisms (e.g., male/female) central to the previous two approaches either overlook or downplay both the diversity of women's experiences and the fragmentation of their identities along the lines of age, race, class, ethnicity, and sexual orientation. No single theory, framework, set of values, or public policy solution captures the diverse contexts in which women live their multiple lives. Postmodern feminist scholars prefer accounts that are partial, sensitive to context, analytically diverse, and comparative rather than universal in their claims.

Feminist scholars increasingly have turned toward gender, not women, as the key analytic category in feminist scholarship. The term gender was embraced because it is inclusive of both sexes and highlights how the two sexes exist relationally. Gender is a "constitutive element of social relationships based on perceived differences between the sexes and it is a primary way of signifying relationships of power."^[3] Gender and gender relations are never neutral, but embedded in and shaped by such larger systems of power as culture, economics, and politics. Different historical moments and contexts produce and reproduce a vast array of gender power arrangements that affect how men and women come to understand themselves, each other, and the world around them. Gender power arrangements are embedded in organizations and institutions, and in the language, practices, and values that constitute them.

GENDERING PUBLIC ADMINISTRATION'S HISTORY

Until recently, it was understood that women played little to no role in the discipline's founding. The lone exception was Mary Parker Follett, whose writings were "lost" because they were categorized as part of the scientific principles approach to administration. She has been rediscovered currently as a pioneer organizational theorist whose work on power (power with, not over, subordinates) anticipated the humanistic approach to management. She is now credited for her pathbreaking ideas, that leading and administering are situational and relational practices; that administrative situations should be viewed from multiple perspectives; and that problems should be solved cooperatively.

Stivers' analysis of the "bureau men and settlement women," along with Guy's account of the "amazing Miss Burchfield," reveal how municipal reform organizations and disciplinary institutions were structured in ways that systematically excluded women, and both highlight the gendered nature of the discipline's founding narrative.^[4,5] Women were present, not absent, from the field's founding, but they and their professional contributions were "forgotten" when the narrative was constructed.

Not only did women play key roles in the discipline's founding, but also they along with the men involved in the settlement movement actually developed an alternative construction of administrative reality organized around care for others, improving people's actual living conditions, and "collaborating with those closest to problems to develop and implement solutions."^[4] For these reformers, the guiding metaphor was the home, not business, and they saw their reform work as "municipal housekeeping." Their values, practices, and reform goals formed a clear "feminine" alternative to the "masculine" values, practices, and reform goals that came to shape the discipline today.

GENDERING PUBLIC ADMINISTRATION THEORY

Because feminist theory is a complex, multifaceted body of work, there is no single overarching feminist theoretical framework in public administration. Gender scholars have drawn variously on feminist theory both as a means of critique and as a way to frame feminist alternatives to the bureaucratic and market methods of organizing. Feminist theory has been especially useful in exposing the long-standing belief that public administration's mainstream theories and concepts are gender neutral. In *Gender Images*, Stivers' analysis shows that mainstream theories and concepts (e.g.,

management, expertise, leadership, and virtue) contain "dilemmas of gender," and more specifically documents how they reflect values and practices culturally coded as masculine.^[2] McSwite, in *Legitimacy in Public Administration*, maintains that public administration's gender problem runs deeper than just the reflection of masculine values and practices. Drawing on psychoanalytic theory, McSwite argues that public administration as a discipline has suppressed the feminine since its founding by actively denying any role for emotion, feeling, intuition, collaboration, and process in mainstream administrative theory and practice.^[6]

One of the earliest gender scholars to envision public administration transformed by feminist theory was Ferguson, who proposed that "women's submerged discourse" could be used to build a nonbureaucratic collective life centered on human development and community needs.^[1] In the early 1990s, Hendricks argued for a "woman-centered" administrative reality that "empowers and affirms diversity," values the "caring encounter," privileges contextual accounts, and nurtures the development of individuals.^[7] In the early 2000s, Hutchinson proposed a "multigendered" public administration that reflects, not restricts, the different ways individuals perform their identities.^[8] Most recently, McSwite urged public administration to embrace the "model of administration" found in *Bureau Men, Settlement Women*, which "is based on the dynamic of consciousness in which the male and female functions perform in complementary balance."^[9]

GENDERING PUBLIC ADMINISTRATION PRACTICE

Acknowledging that public administration is an applied field, gender scholars purposely have focused on the need to change administrative practice if administration is to become gender inclusive. Changes would include improving women's numerical representation in bureaucracies; correcting women's underrepresentation in specific government professions and agencies; addressing sexual harassment in the public workplace; creating family friendly public workplaces; and removing barriers to women's promotion through the ranks of public executives. Public personnel practices also would need to change so that the performance of emotional labor, generally done by women, might become fully recognized and rewarded.^[10] Other changes would entail making bureaucracies less hierarchical, more participatory, and democratic; and they would be led by administrators whose models of leadership drew from feminist organizing and women's actual experiences as leaders and managers.

The most significant shifts in practice would come if public administration were to become explicitly care centered. A care-centered public administration would draw on the historical legacy of the settlement women and be grounded in an ethics of care. It would promote a situational, contextual approach to administration and place relational leadership at its center, which calls on leaders to build caring relationships inside and outside the organization. Among its governing values would be empathy, compassion, connection, and commitment.^[11]

If the care perspective is to become an alternative framework for public administration, then the assumptive base for theory and practice in the field would have to change. The traditional assumptive base for public administration is bureaucracy, with its focus on the efficient and neutral delivery of public goods and services. This assumptive base was challenged during the 1990s by those arguing for an alternative one borrowed from the marketplace, which emphasized the private and non-profit sectors as deliverers of public goods and services. The care perspective's assumptive base is relationships, and the obligation to create caring, democratic relationships in the public sector is presumed to be as vital as achieving market or bureaucratic efficiencies in the delivery of public goods and services. Relationships of all kinds would become part of the discipline's scholarly and practical focus, including those involving administrators and clients, administrators and citizens, administrators and elected officials, and administrators and coworkers.

Moving public administration toward care is important in part because it would make the discipline much more gender inclusive, but also because it is very likely that in this century how we care for each other as a society will be the next great domestic policy challenge. Public administration's role in meeting that challenge will depend on whether it takes care as seriously as it has taken bureaucracy, business, and markets.

CONCLUSION

This entry provided an overview of the evolving gender perspective within public administration.

Gender scholars have worked to make women, feminist theory, and gender itself visible within a discipline where the invisibility of gender long has been the norm. Their efforts have produced deeper, more complex readings of public administration's history, theory, and practice, and they have made a strong case for installing the concept of care as the assumptive base for theory and practice within public administration. A next step gender scholars would recommend is to establish a fresh discourse within public administration that legitimizes care narratively by telling the many stories of how care is valued and practiced by people at all levels of government.

Gender Bias, Ethical Analysis of and in Public Policy

J. J. Hendricks

April Hejka-Ekins

Department of Politics and Public Administration, California State University, Stanislaus, Turlock, California, U.S.A.

INTRODUCTION

The content of this entry defines and discusses gender bias, the theories that have been central in its exposure and analysis, ethical implications, and the effect of gender bias in public policy. The theories discussed are elaborated upon as they affect the public service and its mission. Gender bias is an increasingly recognized topic with significant ramifications for citizens and public-sector employees. There are enormous ethical implications issuing from the way in which the legitimate needs of citizens are disproportionately recognized in policies and disproportionately served programmatically as a result of gender. In this entry, the ethics of care and the postmodern structural critique are presented. Both critiques are highly relevant to public administration. Finally, thoughts on attempts to present alternative feminist policy delivery systems are discussed.

GENDER DEFINED

Although often treated synonymously, gender is to be distinguished from the biological category sex, which is used to denote femaleness and maleness. Both sex and gender have come under increasing scrutiny as categories. They have been subjected to criticism as essential, therefore natural, categories. Gender is a dichotomous typology, which is socially constructed through the many processes that pervade a culture. Through the creation of the social types, female and male, humans are divided into categories, and traits and roles deemed appropriate for males and females are assigned to each. Traditionally, in patriarchal societies, males are assigned traits such as strength and competitiveness, while females are assigned traits such as docility and the capacity to nurture. These traits are assigned differently in various cultures, an example being the hijras of India, men who adopt female dress and behavior.^[1]

GENDER ROLES AND BEHAVIORAL NORMS

Gender roles are the behavioral sets that accompany the assignment of gender to the categories of male or

female. Members of society are socialized to display the appropriate behaviors assigned their gender roles. Although these learned roles may vary somewhat in different contexts, for example, in the workplace or in the home, expectations for both genders are remarkably durable and affect interactions in all contexts—the family, the educational setting, and the workplace—to one degree or another. Given the establishment of contexts as the domains of males, for example, combat and business, or females, for example, the home and professions such as social work and nursing, these contexts take on the behavioral norms associated with an assigned gender. In addition, much work is segregated by gender, which means that structural as well as behavioral norms are gendered.

THEORETICAL CRITIQUE

Gender and sex have been subjected to heavy criticism. Sex as a biological phenomenon is a great deal more plastic than popular culture allows.^[2] This is important to a discussion of gender, as biological determinism is often used to support the essential nature of males and females and the established gender categorizations. Biological determinism is the claim that sex determines behavioral outcomes.

Gender as a construct has been heavily criticized by all schools of feminist thought. One of the most recent and influential schools of thought, postmodern feminist critique, originates in a number of sources, but the work of Jacques Derrida is often utilized in constructing an argument. In Derrida's critique of modernism, reality is first divided into oppositional categories (either/or, black/white, male/female, public/private). One opposition is subsequently elevated and privileged, and one is devalued by comparison.^[3] Using Derrida's method of deconstruction, feminist theorists deconstruct the binary opposition of male/female and the subsequent assignment of these categories to either the public or private arena. Thus, bias enters the picture.

Gender bias can be defined as the privileging of males over females and things masculine over things feminine. Black feminist scholars have revised feminist

criticism to include the unequal positions of women of color. Patricia Hill Collins, for example, has developed a matrix of domination, in which a more complex hierarchical positioning that includes the intersection of gender and race is presented. This intersection would incorporate an analysis of the devaluing women of color experience doubly, due to both white privilege and male privilege.^[4]

STREAMS OF ETHICAL ANALYSIS

As a reaction to gender bias, two streams of ethical theory and analysis have emerged. One stems from the feminine school of thought, which advocates that an ethic of care needs to be valued by society and incorporated into organizational norms and institutional processes. A second stems from postmodern feminist theorists who critique the structure and arrangement of male-dominated organizations. Both schools attempt to eliminate gender bias through different approaches.^[5]

THE FEMININE ETHIC OF CARE

As compiled by Scranton and Rainney, the literature indicates that the feminine ethic of care was first articulated by Carol Gilligan in 1982 as a reaction against what she considered to be the gender-biased theory of Lawrence Kohlberg, who advocated that justice is the primary ethic in decision making. Kohlberg constructed a six-stage model of moral development, based on notions of universality, abstract reasoning, and individual rights, while relegating the value of caring to stage three in his schema. In response, Gilligan criticized Kohlberg for discounting the importance and complexity of the value of caring, asserted that the moral development of women is based on a different voice—an orientation of caring—and proposed a morality of care and responsibility. Other feminine theorists, such as Noddings, Tonto, and Chodorow, critiqued the exclusion of care as an essential aspect of gender bias and advocated for its acknowledgement and primary inclusion in all aspects of social and organizational life.^[5]

THE POSTMODERN CRITIQUE

However, research studies by Kanter, Derry, and Stewart and Sprintall have shown that the ethic of care is not expressed by women in male-dominated organizations. Indeed, because no value differences could be found among men and women, it appears that in order to succeed, women are forced to adapt to the demands

of the gendered organizational structure and culture in which they work. As a result, postmodern feminist ethicists critique male-dominated organizations by showing how the structure of hierarchy and the cultural values of aggression and competitiveness suppress the expression of care by women who strive to be successful in organizations.^[5] Kathy Ferguson maintained that the subordinate position of women in public life rests upon the increasingly bureaucratic nature of modern society. In this description, large-scale bureaucracy as a masculinist form of organization with a propensity toward conformity, control, and anonymity, systematically renders the voices of women as workers and clients silent, as well as any alternative vision of collective life.^[6] The recent work of Camilla Stivers discussed the materially different organizational reality and dissonant professional roles of women relative to men as civil servants.^[7] At the same time, Ferguson and Stivers exposed the contradiction that while bureaucracies in structure, culture, and practice are discriminatory toward women and hamper their full expression, the ethos of serving the public good renders the public workforce and its clientele “feminized” and devalued in the thinking of society.

PRESCRIPTIONS FOR CHANGE ISSUING FROM ETHICAL ANALYSIS

It is not difficult to see how devalued notions of the feminine in society affect the ethic of care within the fabric of organization and society. It is also not difficult to find ways in which to demonstrate alternative approaches to organizational life. Two responses to ameliorate gender bias have emerged from the feminine ethic of care within organizational life to transform male-dominated organizational structure and culture. Feminine theorists advocate for the inclusion of the ethic of care within organizational life to transform male-dominated institutions. For example, Helgeson described how women who reach the top levels of management are more willing to express the care ethic and implement feminine values, while Rosner suggested that women’s management style tends to be more inclusive, more flexible, and more supportive than men.^[5] By legitimizing the feminine care ethic, these theorists are trying to persuade the male-dominated power elite that inclusion of the care ethos in organizational structure and culture will improve work life and organizational effectiveness, while simultaneously uplifting the status of women. The second response by feminist theorists and activists is to reject gender-biased institutions and create feminist organizations that reflect a more organic, decentralized form and culture of values that include respect,

equality, diversity, open communication, collaboration, creativity, and consensus. Ferree and Martin documented a wide range of organizations that have been effective on a global level. Women envision these organizations as embodying a transformative process that provides a moral framework for expressing such values as nurturance, democracy, and empowerment.^[8]

POLICY IMPLICATIONS

One question that arises from these two women's movements to counter gender bias is the extent to which the feminine ethic of care and the creation of feminist organizations affect public policy and the public sector. In actuality, the devaluing of the position of women in the public sector interacts with the inequitable implementation of public policies to continue the concrete effects of gender bias. This actuality rests on a gendered philosophical and structural foundation, which initially excluded women.

GENDER BIAS IN THE FOUNDING DOCUMENT

The United States Constitution as the founding social contract on which public policy in the United States rests has been incisively criticized by MacKinnon for its exclusion of the standpoint of women citizens in the deliberation, articulation, and implementation of policy.^[8] This absence of the voices of women's issues from the binary construction of the socially constructed public spaces of men and the domestic spaces of women, was termed "the doctrine of separate spheres."

THE GENDERED NORMATIVE ORDER

Gendered institutions and constructed realities result in a view of public policy in which the feminine as a devalued category affects the "taken-for-granted" nature of the lived experience of citizens. Many of the gendered ways in which resources are allocated are viewed as normal and not questioned. Assertions of inequitable relations and policy distribution must do battle with the normative views of the established order. These views are legitimized by the institutional belief systems of, for example, religious and economic theories extant in society.

IMPACT OF GENDER BIAS REVEALED

The numerous arenas in which policy analyses detail inequitable distribution of resources by gender as well

as by gender intersecting with race, preclude elaborate or substantial documentation, given the scope of this entry. A broad overview presents a grim and inequitable picture. Occupational and wage distribution exhibits gross inequity. Poverty and welfare are increasingly manifest among women, spawning the term "the feminization of poverty." Sociologist Margaret Anderson indicated that in 1997, 31.6% of all female-headed households lived below the official poverty line.^[9] The callousness of the "taken-for-granted reality" of the American public is illustrated by the common term, "welfare queen." Such terms are not harmless, but affect political realities and the policies consistent with such views, i.e., "workfare." Work that is traditionally performed by women is excluded from that which produces a wage. Women in the workforce continue to earn around 74% the income of men. Workplace environments have been addressed above but must be included when addressing violence against women. The incidence of women's sexual harassment has remained at just below 50% since the policy guidelines were articulated in 1980. Costs to individuals, women as a group, and employers are many, serious, and economically very high.^[10] Domestic violence and incest seem impervious to policies and criminal statutes directed toward them. Women's health and reproduction issues continue to be defined largely by men who dominate science, medicine, and policy-making institutions. In issues such as war and peace, women's concerns are largely missing. While 14% of the officers in the military are women, gender segregation persists.^[9] As a gendered institution characterized by violence, aggression, and force, military values legitimize violence and sexual aggression in war. From the incidence of gender bias, one can only conclude that gendered institutions are to date impervious to efforts to ameliorate them or their effects. To overcome this tendency toward the status quo will take great and enduring effort.

CONCLUSION

One insight seems particularly important to note. Feminist organizations that resist cultural norms of gender bias have proliferated both inside and external to the public service over the past 30 years. They serve the purpose of providing alternative structural arrangements, as examples of what might be desirable to achieve. Though valuable in this way, they do not significantly impact the power inequities in public policy that act to structure and control women's lives. Their successes are striking but in no way create the change that the public is led to believe exists in the average women's daily lived existence. In fact, they often function to address and remediate the most

blatant violent examples of gender discrimination, masking the common realities. This conclusion is not meant to devalue or downplay the heroic and enduring efforts of feminists to act over time on behalf of women. However, until changes in consciousness and power occur, the ill effects of gender bias will remain unabated.

Generally Accepted Accounting Principles (GAAP)

Catherine L. Staples

Department of Economics and Business, Randolph-Macon College,
Ashland, Virginia, U.S.A.

INTRODUCTION

Generally accepted accounting principles (GAAP) are the minimum standards or rules organizations must follow in determining what financial information should be included in the general-purpose financial statements and how the information should be presented. These basic guidelines form the basis around which financial statements are created.

WHO ESTABLISHES GAAP?

The primary organizations responsible for setting accounting standards are the Governmental Accounting Standards Board (GASB), the Financial Accounting Standards Board (FASB), and the Federal Accounting Standards Advisory Board (FASAB). For state and local governments, GAAP is established primarily by the GASB, while the FASAB serves as the main standard-setting body for the federal government. All other entities, including non-governmental not-for-profits, follow guidance established by the FASB.

Of the three, FASB and GASB are considered parallel organizations. That is, they perform the same function, standard setting, but for different types of entities. In addition, oversight responsibility for both boards lies with the same private-sector organization, the Financial Accounting Foundation, whose primary responsibilities include appointing the seven members of each of the two boards and providing considerable financial support for the operating expenses of both.

Federal governmental agencies apply accounting and reporting standards recommended by the FASAB. This relatively new organization was created in 1990 and consists of 10 members, four of whom must come from the Board's sponsors which include the Department of the Treasury, the Office of Management and Budget, the Office of the Comptroller General, and the Congressional Budget Office. The remaining six members are chosen from the public or non-federal sector of accounting. After careful deliberation by the Board, and final approval by the Director of the Office of Management and Budget and the Comptroller General, a standard is issued by the FASAB.

Although the GASB, FASB, and the FASAB are the main standard-setting bodies, other organizations,

such as the American Institute of Certified Public Accountants (AICPA) and the Securities and Exchange Commission (SEC), also provide guidance on accounting and financial issues. This guidance may be considered GAAP if no formal statements have been issued on the topic. Widely recognized industry practices and accounting textbooks are also considered potential sources of GAAP.

OBJECTIVES OF ACCOUNTING AND FINANCIAL REPORTING

The development of GAAP is based upon a foundation of financial accounting objectives or goals. This foundation guides standard setters in their formation of the specific details for a statement and is based upon the primary purpose for the creation of an entity's financial statements. For instance, federal, state, and local governments are concerned with accountability to citizens, while for-profit organizations need to provide information to creditors and investors.

Accountability is the focal point of the accounting objectives for state and local governments. In particular, GASB's Concepts Statement No. 1, *Objectives of Financial Reporting*, purported that the basic function of a set of financial statements is to "justify the raising of public resources and the purposes for which they are used."^[1] Consequently, state and local government financial reports should be used primarily to compare actual financial outcomes with the legally adopted budget, appraise the financial condition and results of operations, and ensure compliance with applicable legal or contractual requirements. Governments must be accountable to several groups of stakeholders, including citizens, legislative bodies, oversight officials, investors, and creditors.

The FASB established accounting objectives with the focal point being the provision of useful information to users. FASB's Statement of Financial Accounting Concepts No. 1, *Objectives of Financial Reporting by Business Enterprises*, described the three main objectives as follows: 1) provide information about economic resources, claims to resources, and changes in resources and claims; 2) provide information useful in assessing the amount, timing, and uncertainty

of future cash flows; and 3) provide information useful in making investment and credit decisions.^[2]

The FASAB issued Statement of Federal Financial Accounting Concepts No. 1, *Objectives of Federal Financial Reporting*, detailing four objectives, which focused on accountability. Financial statements prepared by federal government agencies should be based upon the objectives of budgetary integrity, operating performance, stewardship, and systems and controls.^[3] A federal government agency’s compliance with applicable budgets, laws, and regulations is the focus of the objective budgetary integrity in reporting, while the objective of operating performance suggests the importance of evaluating and reporting an entity’s service efforts, costs, and accomplishments. The remaining objectives also reflect a need for accountability over a government’s operations and its financial systems and controls.

THE HIERARCHY OF GAAP

As shown, a variety of reference sources are available to finance officers, including official pronouncements of the FASB, GASB, and the FASAB, pronouncements and practice guides from other organizations, such as the SEC and the AICPA, and even accounting textbooks. Given this variety, how does a finance officer decide which rule, practice, or pronouncement should predominate? The AICPA, in Statement on Auditing Standards No. 69, “*The Meaning of Present*

Fairly in Conformity with Generally Accepted Accounting Principles in the Independent Auditor’s Report,” provided finance officers with guidelines to use in determining when a set of rules takes precedence over all the others.^[4] The hierarchy that should be followed in the selection process for state and local governments and for non-government organizations is shown in Table 1. An amendment to SAS No. 69, SAS No. 91, *Federal GAAP Hierarchy*, provides a hierarchy for federal governmental entities as illustrated in Table 2.^[5] In all three cases, Level 1 sources, which primarily include official pronouncements of the governing board, take precedence over all other possible GAAP sources. If no Level 1 source is available, Level 2 sources are consulted, then Level 3, Level 4, and, finally, Level 5.

In each case, official pronouncements from the governing organizations take precedence over those issued by other organizations. For instance, state and local governments must follow relevant GASB pronouncements, unless specifically approved by GASB. If no pronouncements exist on the subject, other sources, including FASB pronouncements, can be utilized.

EXAMPLES OF GAAP FOR STATE AND LOCAL GOVERNMENTS

The following sections describe a few of the accounting rules and regulations considered GAAP for state and local governments.

Table 1 GAAP hierarchy summary

State and local governments	Non-governmental entities
1. GASB Statements and Interpretations; AICPA and FASB pronouncements if made applicable to state and local governments by the GASB	1. FASB Statements and Interpretations, APB Opinions, and AICPA Accounting Research Bulletins
2. GASB Technical Bulletins; AICPA Industry Audit and Accounting Guides and Statements of Position if made applicable to state and local governments by the GASB	2. FASB Technical Bulletins, AICPA Industry Audit and Accounting Guides, and AICPA Statements of Position
3. Consensus positions of the GASB Emerging Issues Task Force (when created); AICPA Practice Bulletins if made applicable to state and local governments by the AICPA	3. AICPA Practice Bulletins and consensus positions of the FASB Emerging Issues Task Force
4. Implementation guides published by the GASB staff; widely recognized and prevalent industry practices of state and local governments	4. AICPA accounting interpretations, “Qs and As” published by the FASB staff, as well as industry practices widely recognized and prevalent
5. Other accounting literature, including GASB Concepts Statements; FASB Concept Statements; AICPA Issues Papers; International Accounting Standards Committee Statements; pronouncements of other professional associations or regulatory agencies; AICPA Technical Practice Aids, and accounting textbooks, handbooks, and articles	5. Other accounting literature, including FASB Concepts Statements; APB Statements; AICPA Issues Paper; International Accounting Standards Committee Statements; GASB Statements, Interpretations, and Technical Bulletins; pronouncements of other professional associations or regulatory agencies; AICPA <i>Technical Practice Aids</i> ; and accounting textbooks, handbooks, and articles

(From SAS No. 69, *The Meaning of Present Fairly in Conformity with Generally Accepted Accounting Principles in the Independent Auditor’s Report*.)

Table 2 Federal GAAP hierarchy

1. FASAB Statements and Interpretations plus AICPA and FASB pronouncements if made applicable to federal governmental entities by a FASAB Statement or Interpretation
2. FASAB Technical Bulletins and the following pronouncements if specifically made applicable to federal governmental entities by the AICPA and cleared by the FASAB: AICPA Industry Audit and Accounting Guides and AICPA Statements of Position
3. AICPA Accounting Standards Executive Committee (AcSEC) Practice Bulletins if specifically made applicable to federal governmental entities and cleared by the FASAB and Technical Releases of the Accounting and Auditing Policy Committee of the FASAB
4. Implementation guides published by the FASAB staff and practices that are widely recognized and prevalent in the federal government
5. Other accounting literature, including FASAB Concepts Statements; FASB Concepts Statements; GASB Statements, Interpretations, Technical Bulletins, and Concepts Statements; AICPA Issues Papers; International Accounting Standards of the International Accounting Standards Committee; pronouncements of other associations or regulatory agencies; AICPA *Technical Practice Aids*; and accounting textbooks, handbooks, and articles

(From SAS No. 91, Federal GAAP Hierarchy.)

Fund Accounting

Because accountability is a key component in government financial reporting, state and local governments are strongly encouraged to use funds in the accounting for resources. Used to demonstrate compliance with legal and contractual requirements, a fund is a separate accounting and fiscal entity with a self-balancing set of accounts from which financial statements can be prepared. Because the use of funds provides for more control over resources, most state and local governments utilize more than one fund, depending on the source and use of those resources. Essentially, each fund maintains its own set of accounting records, interacting with other funds whenever appropriate. Further, because each fund maintains a separate set of accounts, each fund also generates its own set of financial statements.

Three main categories of funds exist: governmental, proprietary, and fiduciary. Which fund a government uses is determined by the source and use of the resources involved. Governmental funds are utilized for basic government activities financed primarily from taxes and intergovernmental grants. Proprietary funds are for business-type activities that generate most resources through the collection of user fees. Fiduciary funds account for resources held by the government, or its agent, in trust for a third party.

Resource flows for the basic operations of state and local governments are accounted for in a governmental fund. In particular, the majority of the resources are accounted for in the general fund, a subfund of the governmental funds. Typically, the general fund is the largest and most active of all funds. For some small governments, it could be the only fund utilized. General fund resources that have been legally restricted for specific purposes typically are accounted for as a special revenue fund, another subfund of the

governmental funds. A government that provides services to the public at large and charges a fee for the services could account for the resources in an enterprise fund, a subfund of the proprietary funds. A separate enterprise fund would be used for each “business,” maintaining increased control and responsibility over the fund’s resources. An agency fund, a subfund of the fiduciary funds, may be used to account for sales tax monies collected by a city for the state government. Soon after the monies go into the fund, they are transferred out to the state government.

Modified Accrual Accounting

Because governments are concerned with how resources are consumed, and not the bottom line, the basis for accounting for those resources differs from that of for-profit organizations. For-profit organizations utilize full accrual accounting that requires an entity to recognize revenue when it has been earned, that is, when the related goods and services have been provided. The revenues also must be measurable, i.e., the amount of the revenue is known. In addition, full accrual accounting requires the recognition, or recording, of an expense, whenever a cost is incurred that helps to generate revenue. This provides for an appropriate matching of revenues and expenses in the financial statements and results in a measurement of income for a specified period.

Under modified accrual accounting, revenue recognition follows that of full accrual accounting, with one major caveat. In addition to being earned and measurable, revenue must be available to finance expenditures of the current fiscal period. The GASB Statement No. 33, *Accounting and Reporting for Nonexchange Transactions*, stated “available means collectible within the current period or soon enough

thereafter to be used to pay liabilities of the current period.”^[6] Full accrual accounting only requires a reasonable assurance that the cash will be collected, while modified accrual accounting provides greater assurance that the cash will be available to pay liabilities when they come due. So how does a government interpret “available”? GASB only provided a specific definition of “available” for property tax revenues. Existing standards, in particular, GASB Interpretation No. 5, *Property Tax Revenue Recognition in Governmental Funds*, provided that if property taxes are collected more than 60 days after the end of the fiscal year, they may not be recognized in that fiscal year, because they cannot be used to pay the current liabilities.^[7] They must be recognized in the year of the collection. Because no specific guidelines exist for other types of revenues, some governments have established time periods such as 30 days, 60 days, or longer for their recognition.

The recognition of expenses also differs under modified accrual accounting. For instance, governmental funds following modified accrual accounting recognize expenditures, not expenses. Expenditures are defined as decreases in net current financial resources, such as cash, while expenses are a reduction in overall net assets, such as the depreciation of a building or the use of supplies. Existing standards require the recognition of an expenditure when cash is paid out or when a liability has been incurred for goods or services received. For instance, if a local government buys a new fire truck, whether with cash or on credit, an expenditure is recognized immediately. An asset may be recorded but in a separate fund from the expenditure. A for-profit organization would recognize an asset and then expense a portion of the cost each year for the remainder of the truck’s economic useful life.

The Governmental Reporting Entity

Many state and local governments are affiliated with independent legal entities that provide them with essential services the governments do not provide for themselves. For instance, a local government may determine a need for a wastewater treatment plant. Once it is established, the governing board could choose to operate the plant as an integral part of the government and account for it as an enterprise fund. Recall that an enterprise fund is a government business that charges a fee for its services. Under this approach, any debt entered into by the plant would affect the debt levels of the whole government—not just the treatment plant. If the wastewater treatment plant was established as an independent legal entity, however, and incurred its own debt, the direct financial effect on the primary government may be minimal.

Obviously, a plant treated as an enterprise fund would be included in a government’s financial statements. But what about the independent legal entity? If the entity was established by the government, should the plant be included as part of the government’s financial statements? GASB Statement No. 14, *The Financial Reporting Entity*, was issued to help resolve potential problems of this type, and it specified criteria for determining what economic entities should be included in a reporting entity.^[8]

Specifically, a financial reporting entity consists of a primary government and any component units associated with that primary government. GASB No. 14 defines a primary government as “any state government or general-purpose local government (municipality or county).”^[8] A component unit is a legally separate government for which the primary government is financially accountable or an organization whose relationship with the primary government is such that if it were excluded from the primary government’s financial statements, they would be misleading and incomplete.

Once a component unit has been determined to be part of the reporting entity, GASB No. 14 also provides criteria as to how it should be included in the financial statements. Depending on the relationship between the two entities, a component unit is blended into or discretely presented on the financial statements of the primary government. A very close relationship between the two entities results in a set of blended financial statements. A superficial evaluation of the blended statements would not suggest the existence of a component unit, because the financial information of the component unit is fully integrated into the data of the primary government. The financial data for a discretely presented component unit, however, is reported on the face of the financial statements in a separate column from the primary government’s information with a total column used to indicate the overall effect of the two consolidated entities.^[8]

The Financial Reporting Model

In June 1999, GASB issued what many consider to be one of the most important statements in the history of governmental accounting. GASB Statement No. 34, *Basic Financial Statements—and Management’s Discussion and Analysis—for State and Local Governments*, radically changed the way financial statements for state and local governments are presented.^[9] Previously, governments prepared individual financial statements for each fund category. With the implementation of GASB No. 34, governments still prepare fund financial statements, but government-wide statements also must be generated. Government-wide statements

are designed to give users an overview of the financial position of the government by consolidating the governmental and business-type activities into a statement of net assets and a statement of activities. In addition, these statements must be presented using full accrual accounting, while fund-based financial statements follow full or modified accrual accounting, depending on the fund. Because the governmental financial information is presented using both the full accrual and the modified accrual bases of accounting, a reconciliation between the two is required to be presented.^[9]

GASB No. 34 also dramatically changed how a government reports its infrastructure, which is defined as long-lived capital assets such as bridges, roads, and tunnels that have economic useful lives significantly longer than most other capital assets. Previously, governments were not required to report this information in their financial statements. The adoption of GASB No. 34, however, results in the inclusion of infrastructure on a government's financial statements. Because many governments may not have maintained accurate records of the cost of their infrastructure, GASB No. 34 allows the use of estimates for retroactive reporting of infrastructure. New assets must be reported at actual cost.^[9]

In addition, governments must record depreciation for their infrastructure on the government-wide financial statements. Two options for depreciation exist. First, a government may record depreciation in a manner similar to other capital assets—over a fixed period of time using a method such as straight-line depreciation. Each year, depreciation expense and accumulated depreciation would be recorded for the infrastructure. Or, a government may choose to use the modified approach to infrastructure reporting. Essentially, if a government chooses the modified approach, it chooses not to depreciate. However, the government is committed to the maintenance of accurate, up-to-date inventory records of its infrastructure and is committed to preserving the assets at a prescribed condition level. Any expenditures made to extend the life of the infrastructure would be charged to expense and recognized in the period incurred.^[9]

CONCLUSION

In simple terms, GAAP is a set of rules for reporting financial information. Whether for a governmental, non-profit, or a for-profit entity, financial statements prepared following GAAP provide users with assurances as to the reliability of the information and give preparers some guidelines to follow in the creation of those reports.

Geographic Information Systems and Public Policy

Akhlaque Haque

*Department of Government, University of Alabama at Birmingham,
Birmingham, Alabama, U.S.A.*

INTRODUCTION

Geographic information systems (GIS) are computer-based information management applications for collecting, storing, managing, retrieving, mapping, and analyzing spatially referenced data. They are powerful tool in facilitating quick and interactive visualization of objects or geographical phenomenon over a computer screen and are useful in solving many planning and management problems. By incorporating space or location into decision-making models and displaying the attributes or characteristics of the space, GIS provide policy analysts with new tools of communicating data through maps.

Although GIS's primary purpose has been to understand the spatial distribution of data in question, it finds its most use in decision making, especially for solving complex problems with nondeterministic outcomes. Because public policy problems are often multidimensional and semistructured, GIS can be a valuable tool in exploring and explaining policy outcomes for a given space. Whereas, quantitative statistical data may reveal nuances between and within variables in a model, a map of the data, on the other hand, concisely communicates spatial distribution, enabling the viewer to better understand patterns and relationships through scenarios (of maps). For example, GIS can be used to explore the crime pattern in a given location by investigating the type of criminal activity and explore the socioeconomic characteristics that attract and/or lead to criminal behavior in that location. Furthermore, the same GIS model for the area can be extended to address policy questions related to race relations, substance abuse, education, or health. As an enabler of sorts, "GIS is both a tool box for advanced analysis and capabilities and a sandbox to express our creativity."^[1] Today GIS is also being viewed as an important group-decision-support tool allowing differing views about a project to be portrayed in a set of maps discussed among stake holders.^[2] The GIS support both exploratory and confirmatory analysis, provide tools for both inductive and deductive approaches, and support both scientific research and the implementation of public policy based on GIS models.

The purpose of this entry is to provide an overview of GIS as it relates to public policy decision making.

The first section describes how GIS works followed by particular examples of GIS in public policy. A section describes why GIS is an important tool for public policy analysis with the follow-up section describing where GIS finds its most use. The final sections describe the implications of GIS in a representative democracy.

HOW GIS WORKS

Conceptually, GIS can be regarded as a decision-support tool that combines the art and science of decision making to represent the real world over a computer screen. The process involves transforming the paper maps into digital format and, using one of the geographical models, mathematically manipulating the three-dimensional earth phenomenon on to a computer screen. The GIS applications boasts in transforming each and every point on earth into an interactively manageable database that allows any location or object on earth on a computer screen that can be digitally manipulated to bring about any possible scenario related to that space. For end users, the most expensive and difficult part of GIS has been obtaining the digitized maps. In recent years the Internet has become the primary resource for such maps. Some of the most commonly used maps are available free of charge from the Bureau of Census and GIS software developers.

The operation of GIS in a nutshell can be described using a schematic diagram. A typical GIS operation as it relates to a data model that is obtained from the real world and expressed in digital format on a computer screen is shown in [Fig. 1](#). For computer processing, the digital information is transformed to machine language (M1, M2).

For example, to represent a geographic phenomenon such as tornado touch-downs, GIS software combines the spatial data (location of tornado touch-downs—latitude and longitude) with the attributes of the spatial location (residential area, forest, highway, river banks, or flood zones) within maps. The final outcome of this mapping scheme, for example, could be the location of tornado touch-downs in low populated residential areas ([Fig. 2](#)). The figure shows tornado

Fig. 1 Schematic diagram of a digital data model of GIS. (From Haque, A. Geographic information systems and decision making. In *Handbook of Decision Making*; Goktug, M., Ed.; CRC Press, 2006.)

touch-downs recorded from May to June 2005 in Eastern Colorado. The base-map shows number of households (darker color showing more households) by census tract along the interstate. Using other census data the map could also be used to reveal information about the people in the affected area, including income level, number of school-going children, age distribution and so on. Such analysis helps disaster management team prepare for recovery and mitigate future catastrophes expected along rural tornado paths. The critical factor is having the right data to show the data model as expressed through the maps.

Once the information is displayed on the screen, decision makers can assess the patterns to further understand the phenomenon and accordingly prioritize areas for future resource allocation and target-based planning. Although GIS technology greatly enhances our decision-making capabilities, it does not replace them. As with any research method tool and more so for GIS understanding the data and the field becomes a necessary condition for the effective use of GIS in policy implementation and planning.

Visual displays generated by GIS software augment decision making by giving added information to data.

Fig. 2 Tracking Tornado path: touch-down locations and number of households by census tract. Tornado point data. (From <http://www.tornadochaser.net/2005.html>; Map produced using ArcGIS 9.0 by Environmental Systems Research Institute (ESRI).)

The quality of decision making is expected to be better not because GIS software generate more information, but because people can relate to the situation or problem in the real world through visual inspection. For example, data for school children by age and their nutrition level for each city in a county can be mapped to reveal the neighborhoods where the problem of nutritional deficiency among children is prominent. The same analysis can be done for any neighborhood, and the decision maker can relate to his/her own neighborhood. The value of cartographic visualization may indeed add knowledge to traditional approach to decision making.

GIS AND PUBLIC POLICY

According to Bolstad GIS is a computer-based system designed to aid the collection, maintenance, storage, analysis, output, and distribution of spatial data and information.^[3] The foundation of GIS involves both the creation and the maintenance of a relational database. Relational databases are characterized by their ability to combine information from different areas and relate them to each other. The GIS is not viewed as a stand-alone application but as an integrated system that is based on geographic information science and supported by technological innovations made in different disciplines including geography, cartography, photogrammetry, remote sensing, surveying, geodesy, civil engineering, statistics, computer science, operations research, artificial intelligence, demography, and many other branches of the social sciences, natural sciences, and engineering. In fact, the power of GIS lies in its interdisciplinary character and appeal. It provides unprecedented opportunities for collaboration among various governmental, nongovernmental, and private agencies. In addition through interactive visualization and web-enabled GIS, citizens now have the chance to participate in decision making and, at least, visually comprehend how various public policy decisions are affecting them. It is not surprising, whereas in 1992, 40% of the local governments used GIS, in 2003, according to a survey sponsored by the U.S. Department of Interior and conducted by the Public Technology Inc., 97% of the local governments with populations 100 thousand and 88% of those between populations 50 and 100 thousand use GIS technology.^[4] Today, GIS appears as a given tool for emergency dispatch operations, land use planning including zoning, health-care planning, infrastructure planning and tax revenue assessment, political campaigns, reapportionment of congressional districts, and other mandated rezoning operations. A sample list of GIS use by different industries is highlighted in Table 1.

Table 1 GIS by industry type

Industry	Use of GIS
Forestry	Inventory and management of resources
Police	Crime mapping to target resources
Epidemiology	To link clusters of disease to sources
Transport	Monitoring routes
Utilities	Managing pipe networks
Oil	Monitoring ships and managing pipelines
Central and local government	Evidence for funding and policy, e.g., deprivation
Health	Planning services and health impact assessments
Environment agencies	Identifying areas of risk from, e.g., flood
Emergency departments, e.g., ambulance	Planning quickest routes
Retail	Store location
Marketing	Locating target customers
Military	Troop movement
Mobile phone companies	Locating masts
Land registry	Recording and managing land and property
Estate agents	Locating properties that match certain criteria
Insurance	Identifying risk, e.g., properties at risk of flooding
Agriculture	Analyzing crop yields

[From Getting Started with GIS. (n.d.). Who uses GIS and Why. <http://www.gis.rgs.org/10.html> (accessed April 2006).]

Policy Analysis Using GIS

Public policy problems are semistructured—they require thorough exploration before they can be understood and viable solutions can be proposed. Decision makers who have different expertise and goals in finding solutions to the problem can take advantage of GIS tools to interactively communicate and better understand the competing choices available to them. The effectiveness of GIS as a decision-making tool relies heavily on collaboration. Especially, for public policy making, such efforts are greatly enhanced by the capabilities GIS provide for collective decision making. It commonly involves three categories of participants in the decision-making process: 1) stakeholders, 2) decision makers, and 3) technical specialists. The stakeholders or the participants who directly or indirectly will be affected by the decision, make up, what can be called, the *GIS User Group*. The user group

plays a critical role in *formulating* the plan using set of maps showing the decision outcomes. People who are primarily involved in creating the maps, i.e., technical experts who manage and manipulate the data to accurately represent the real world on a computer screen, form the *GIS Support Group*.

The value of GIS in a democracy may not be in its technological supremacy rather in its effectiveness as an intermediary (as a tool) that resolve conflicts and seek for compromising options among competing powers. It can be designed to allow different participants to specify and apply their criteria using the relative weights associated with each model displayed in maps. The solution from each model then can be summarized through a GIS-based data management report that highlights the characteristics of each solution. The collaborative nature of GIS tools has attracted a new group of GIS practitioners who envision GIS as a participatory tool for decision making. Their approach is commonly known as the Public Participation GIS (PPGIS). The PPGIS seek a method within broader GIS scheme to use GIS as an empowering tool by making it accessible to general public and enabling communities to participate in critical decisions in housing, zoning, health, racism, environmental equity, and sustainable developmental projects.^[2] As computers become more widespread and economical, average people is expected to employ GIS technology to amplify their voices as it relates to their own governance. The optimism is clearly due to the communicating capability of GIS through “What You See is What You Get” (WYSWYG) approach.

Although maps are traditionally used for communication (generally understood by a lay person), for policy analysis, visualization techniques will have to take precedence over communication to reveal subtleties in data. In other words, scientific visualization approach must be followed in order to understand the spatial relations that common eye may not reveal. Scientific visualization allows users to interpret, validate, and explore their data in much greater detail. The visualization technique can be described as intuitive science—extracting information for hypothesis generation and policy evaluation. According to Dorling and Fairbairn the science of visualization is “process of learning through the creation and observation of abstract images, providing a method for seeing the unseen.”^[5]

Consistent with Simon’s^[6] view of three stages of decision making, namely 1) gathering intelligence on decision criteria, 2) designing options to choose from, and 3) the choice; decision makers can utilize GIS maps to: a) formulate the question or problem; b) explore and evaluate alternative plan of action (for solving the problem), and c) evaluate a reduced set of competing alternatives. In the absence of a rigorous methodological

“approach to policy analysis, when using GIS, visualization of maps can be used along with the policy cycle.” A policy cycle can be described in four stages: selecting a policy, implementing the policy, understanding the issues, and evaluating the options. In all of the four stages of the policy cycle GIS can be used. “Solutions from each stage can further improve each stages of the policy cycle. The outcomes from each stage can be investigated through a continuous cycle of policy selection and evaluation.

Although the analysis of maps may differ among investigators, a formal process of map generation is in order. The leading GIS software developer Environmental Systems Research Institute (ESRI) recommends simple five steps for mapping:^[7]

1. Frame the question.
2. Select your data.
3. Choose the analysis method.
4. Process the data.
5. Look at the results.

The third step of choosing the map analysis method will differ depending on the level of spatial and cartographic technical knowledge of the user. Some of the more complex policy analysis may require advanced spatial statistical knowledge. However, today most GIS applications have been incorporating spatial statistical techniques for scientific visualization of maps.

IMPLICATIONS OF GIS IN PUBLIC POLICY

The GIS is explicitly employed in the development and implementation and evaluation of public policy, in redistribution of funds, and for identifying communities for target-based intervention. The use of GIS in political reapportionment and redistricting provides powerful evidence of its value as the most efficient tool for that purpose. At the same time, the subsequent abuse of this tool reminds us the dangers and responsibilities of using GIS in a representative democracy (see Refs.^[8,9]). Especially, since September 11, 2001, GIS has taken a new role in providing high-tech GIS surveillance capabilities to the Department of Homeland Security that raises concern about violation of citizen’s rights and civil liberties (see Refs.^[10,11]). Indeed, GIS promises abound so are the challenges. In a more positive side, however, as GIS becomes a common place in the academia including high schools, people will become more aware of the known abuses of GIS and subsequently make GIS users more responsible. In order to reap the benefit of this state-of-the-art technology, it would be foolish to think otherwise. For the next generation of policy analyst in the 21st century this will be

another positive step toward making better policy decisions.

CONCLUSION

Public policy analysis requires a multidimensional approach. No single methodological approach can be best suited for public policy analysis nor can any tool claim to have the magic wand. GIS provides another methodological approach that may have bearing for the future generation of public policy makers and their decision outcomes. Given the built-in communicative power of GIS and proliferation of the Internet, it can have far reaching implications for influencing public policy. One major barrier, however, is the lack of interoperability among GIS and geographic information technologies themselves, and between GIS and other information technology. Moreover, once a GIS project is completed by a governmental agency, it imposes contractual or licensing conditions restricting the use of the data. The reluctance to share the information is in part due to the fear of violating data privacy laws but more for the fear of losing control of the information.^[12] To make best use of this tool, open data sharing policies have to be adopted and GIS should be widely accessible beyond technical experts. In this regard the efforts made by the National Spatial Data Infrastructure (NSDI) through the Federal Geographic Data Committee (FGDC) can have important ramifications for the future of GIS as a public policy-making tool.

Global Ethics and Corruption

Leo W.J.C. Huberts

Department of Public Administration and Communication Science, Vrije Universiteit,
Amsterdam, The Netherlands

INTRODUCTION

Corruption, ethics, and integrity have become important issues in the practice and theory of politics and public administration. This has led to more awareness and knowledge of the ethical or moral dimension of politics and the causes of and solutions for corruption in politics and administration at the national as well as the international levels. Elements of that knowledge and awareness to be discussed include the meaning of concepts, such as corruption, ethics, and integrity; the content of the moral dimension (the values at stake); the causes of (the level of) corruption in different nations; the solutions proposed to curb corruption and to safeguard integrity; and the initiatives by international actors that aim to contribute to that purpose.

CORRUPTION, ETHICS, AND INTEGRITY

Clarity about concepts like corruption, ethics, and integrity is important, certainly when it concerns public debate, policy making, and theory development on an international level.^[1-3]

Public corruption is often defined as involving behavior on the part of officials in the public sector, whether politicians or civil servants, in which they improperly and unlawfully enrich themselves, or those associated with them, by misusing the public power entrusted to them. A brief definition is the abuse of public office for private gain. Corruption, then, is a specific type of violation against the moral norms and values for political and administrative behavior. *Ethics* refer to the collection of values and norms, functioning as standards or yardsticks for assessing the integrity of one's conduct. The moral nature of these principles refers to what is judged as right, just, or good (conduct). Values are principles or standards of behavior that should have a certain weight in choice of action (what is good to do or bad to omit doing). Norms state what is morally correct behavior in a certain situation. Values and norms guide the choice of action and provide a moral basis for justifying or evaluating what we do.

Public integrity denotes the quality of acting in accordance with the moral values, norms, and rules accepted by the body politic and the public. A number

of integrity violations or forms of public misconduct can be distinguished: corruption including bribing, nepotism, cronyism, and patronage; fraud and theft; conflict of interest through assets, jobs, or gifts; manipulation of information; discrimination and sexual harassment; improper methods for noble causes (using immoral means to achieve moral ends); the waste and abuse of resources; and private time misconduct.

In this framework, corruption is a type of integrity violation; however, "corruption" is often also used as the umbrella concept, covering all or most types of integrity violation or unethical behavior.

VALUES AND NORMS TO BE PROTECTED

There are numerous attempts to sum up the basic values that might be seen as constituting public-sector ethics.^[4,5] A well-known ethical framework for public officials was developed in the United Kingdom by the Committee on Standards in Public Life chaired by Lord Nolan.^[4] The Nolan Committee sketched "Seven Principles of Public Life." Holders of public office should decide because of the public interest; private interests or obligations to outside individuals and organizations should have no influence (selflessness and integrity). They should make choices on the basis of merit (objectivity); they are accountable for their decisions and actions (accountability); and they should be as open as possible (openness and transparency). Holders of public office have a duty to declare any private interests and resolve possible conflicts of interest (honesty). They should promote and support these principles by leadership and example (leadership). The Nolan values have been discussed and used in many contexts, for example by the Committee of Independent Experts that reported on fraud, mismanagement, and nepotism in the European Commission of the European Union in 1999 (leading to the resignation of the whole commission in March 1999). Many of the values mentioned can also be found in the codes of conduct of governmental organizations as well as in the United Nations International Code of Conduct for Public Officials. The latter contains a set of basic standards of integrity and performance expected from public officials, with "wide acceptance on the basis of

experience acquired in various countries.” The code includes general principles: public officials shall act in the public interests, function efficiently and effectively, in accordance with the law and with integrity, and shall be attentive, fair, and impartial. The code also contains rules concerning conflicts of interest and disqualification, disclosure of assets, acceptance of gifts and other favors, confidential information, and political activity.

Discussion

An important question is always how important the values actually are for the people working in the organizations with often impressive mission statements and codes of conduct. When politicians tell researchers that honesty and openness are among the values that are most important for their work, this, of course, does not mean these indeed are the central values in actual political decision making.

In the code of the United Nations, values such as efficiency and effectiveness are added to the values more often associated with “moral” values and norms like honesty, selflessness, openness, and accountability. The relationship between these two sets of values has long been a topic in the international political as well as scientific debate. The dominant view in the global discussion nowadays is that state corruption undermines state efficiency and that good governance is a precondition for financial support and developmental aid. On the national level, a comparable view is dominant, although research shows that anticorruption policies and regulation can also harm efficient and credible government.

Another subject to be mentioned is the relationship between the core values of the public and the private realm. How do public- and private-sector values relate to one another? The answer is not an easy one. In the literature, contradictory visions exist. On the one hand, there is the thesis that public and business sector ethics share basic values and norms (as integrity, honesty, and efficiency).^[6] On the other hand, there is the opposite view that stresses that there is a fundamental conflict between the moral foundations of politics and commerce and that organizations will sink in “functional and moral quagmires . . . when they confuse their own appropriate moral system with the other.”^[7] Warnings against the confusion of morals often lead to doubts about practices from the commercial world when these practices are to be applied in the public sector.

EXTENT OF THE PROBLEM IN A GLOBAL CONTEXT

Empirical research by social scientists on the extent of public corruption and fraud is, by definition,

complicated. Corruption is crime without a (recognizable) victim, and the corruptor and the corrupted benefit from secrecy. Most empirical data, therefore, concern criminal cases involving corruption: what has been discovered, investigated, prosecuted, and convicted can most easily be counted. Additionally, information has been collected on opinions on the extent and seriousness of the corruption problem. The most famous research has been done by Göttingen University and Transparency International. Since 1995, a corruption perception index (CPI) is published, based on the perceptions of the degree of corruption as seen by businesspeople, risk analysts, and the general public. Some countries have the reputation of being very corrupt, and as might be expected, most of these are developing countries like Nigeria and Indonesia or transitional (Eastern European) states like the Ukraine. Northern European countries are perceived as being among the less corrupt (Table 1).

The image of countries appears to be rather stable. Once a reputation for corruptness is established, it takes time and efforts to change (Table 2).

Corruption in Business and Government

Corruption research often is research on public-sector corruption. This suggests that the problem is more prominent in government than in business. However, this idea needs to be questioned.

First, it is clear that corruption involves a corruptor and a corrupted. Many bribe givers are business organizations. In business, the possibility of profit is often more important than integrity and ethics, which until recently, was supported by governments of industrialized countries (the costs of bribes have long been tax deductible).

The Transparency International Bribe Payers Survey concerns the willingness of companies from leading exporting states to pay bribes to public officials to win or retain business. It shows that companies from countries like China, South Korea, Taiwan, Italy, and Malaysia are most likely to pay bribes. Additionally, the survey shows that the scores for countries like the United Kingdom, the United States, and Japan are lower than the corruption scores for the countries. Bribing a foreign official seems more acceptable than bribing at home.

Second, survey research shows that corruption experts in higher-income countries differ from their colleagues in poorer countries concerning the prominence of corruption in the public and private sectors. Respondents from the lower-income countries think corruption is much more prominent in the public sector, while experts from higher-income countries find the opposite to be the case.

CAUSES OF CORRUPTION

Research shows that a conglomerate of social, economic, political, organizational, and individual causal factors are important to explain cases of public corruption and fraud in a country.^[2,8,9]

Among the more important political causes are the values and norms of politicians and civil servants and their commitment to public integrity, the organizational quality of the public sector (working conditions,

Table 2 Corruption perceptions index, 1988–2000 (10 highly clean—1 highly corrupt)

control, and auditing), the relationship between the state and the business sector, and a number of social factors (e.g., the presence of organized crime and the content of social norms and values).

These factors are important to explain the corruption in higher- and lower-income countries, but an ample explanation also has to take into account the differences between these countries. A number of factors related to developmental problems are of crucial importance to lower-income countries.^[10] Economic failure and poverty, poor conditions for human development (schooling, health), and corruption are inter-related. For example, it is clear that low salaries and bad working conditions in the public sector can be disastrous for the possibility and the willingness to behave ethically.

For countries going through a process of privatization, liberalization, and democratization, the period of transition offers extra possibilities for corruption.^[8,10] It takes time to establish a more stable political and economic system that is able to curb corruption.

SOLUTIONS AND THEIR EFFECTIVENESS

It is always necessary to relate anticorruption strategies to characteristics of the actors involved (and the environments in which they operate). There is not one concept and program of good governance for all countries and organizations, there is no “one right way.”^[10,11] There are many initiatives, and most are tailored to specific contexts; societies and organizations will have to seek their own solutions.

Yet, they can learn from the experiences of others and the international search for practices based on serious and well-evaluated programs. There are

examples of organizations and societies that succeeded in radically curbing corruption. Hong Kong's Independent Commission Against Corruption is often presented as an example for other countries. This city managed to curb the corruption that was prevalent in the 1960s.^[11]

Concepts and programs like National Integrity Systems (Transparency International), The Ethics Infrastructure (OECD), and A Framework for Integrity (World Bank) offer numerous methods and institutions to curb corruption and promote integrity.^[1,12–15] The main elements are summarized.

The overall *goals* should include development strategies that yield benefits to the nation as a whole, including its poorest and most vulnerable members, and not just to well-placed elites. Additionally, it is important that public services be efficient and effective and that government function under law, with citizens protected from arbitrariness (including abuses of human rights).

Many institutions and activities are important in the struggle against corruption. Leadership counts—the research is unanimous on this. Embodying the political will to fight corruption, leaders set the tone through their policies and the examples they present. In the political system, parliament as representative of the people and watchdog of political power is at the center of the struggle to attain and sustain good governance and to fight corruption. An independent, impartial, and informed judiciary holds a central place in the realization of just, honest, open, and accountable government. The public service is important for its services as well as for the protection of the public decision-making process (including the system of public procurement, often vulnerable because of its opportunities for corruption). Integrity is a crucial element of professionalism. People should be given a feeling of pride in their work and that deviance undermines the core of the profession.

A powerful anticorruption device also is the simple establishment of sound financial management practices, including a timely and efficient accounting system combined with punctual, professional review by internal and independent auditors. Important institutions are also an effective Auditor-General as a watchdog over financial integrity and the credibility of reported information, an ombudsman who can recommend improvements to procedures and practices and act as an incentive for public officials to keep their files in order, and Independent Anticorruption Agencies to raise awareness among the public, to stimulate prevention, and to detect and investigate corruption cases. The availability of resources, their independence from management, and the availability of mechanisms of transparency and accountability are important factors for the success of these institutions. Of importance

is a judicious balance between positive and negative social control. An extreme accent on control can be extremely counterproductive. An anticorruption campaign in New York City fostered its own pathology of excessive rules and procedures, paralysis of decision making, and the undermining of quality.^[16] To safeguard integrity presupposes that attention is being paid to group and organizational culture (norms, values, and perceptions), including training and education in ethical dilemmas and the development of codes of conduct.

Additionally, it is important that the media and civil society play a role. Information and public awareness (the “right to know”), are linked inextricably to accountability, the central goal of any democratic system of government. The principal vehicle for taking information to the public is an independent and free media. The role for civil society must be to claim and defend its own values and not leave this integral function to those in power.

INTERNATIONAL AND SUPRANATIONAL INITIATIVES

Nowadays, a lot of attention is being paid to corruption and ethics in international fora. Anticorruption congresses and conferences with thousands of participants are no exception. Conventions and treaties have been prepared, signed, and implemented, in international relations, conditions of good governance have become an important topic. Governments are more aware of the importance of their national integrity system. Many global and international initiatives are worth mentioning.

The United Nations' General Assembly Resolution on Corruption in 1997 reaffirmed its concern at the seriousness of the corruption problem and adopted the International Code of Conduct for Public Officials. The resolution recommended that member states use the code as a tool to guide their efforts against corruption.^[10] In 2001, the foundations for a United Nations Convention Against Corruption were discussed in The Hague at the Second Global Forum on Fighting Corruption and Safeguarding Integrity. Within the United Nations, the Development Program approaches the issue of corruption as a governance problem, and it has made the minimization of corruption central to achieving the organization's overall purpose of alleviating poverty and attaining social and people-centered sustainable development.^[10]

In line with political developments, major international financial and economic institutions like the World Bank and the International Monetary Fund have made corruption their topic. The World

Bank changed its policies in 1996, and the cancer of corruption is seen as a crucial problem for economic development. Its “Pillars of National Integrity” are interdependent and include the rule of law, sustainable development, and quality of life. Corruption and fraud have become important topics within bank-financed projects as well as in the country assistance strategies and country lending considerations.^[10,15]

The Organization for Economic Co-Operation and Development, with 29 member states, representing the industrialized world, has made anticorruption initiatives and ethics and integrity policies an important aspect of its work.^[13,14] The concepts of an “Ethics Infrastructure” summarizes OECD’s view with core elements of political commitment, workable codes of conduct, professional socialization mechanisms, an ethics coordinating body, supportive public service conditions (decent working conditions), an effective legal framework, efficient accountability mechanisms, and an active civil society. The OECD supports its pleas with research and analysis on the ethics measures of its member countries. In the international arena, the OECD’s main contribution has been the 1997 OECD Convention on Combating Bribery of Foreign Public Officials in International Business Transactions. The Convention was signed by all member countries and came into force in 1999. Its main achievement is that it made bribing a foreign public official a criminal offense in many countries (while in the past, this bribe was even tax deductible in several of the OECD countries).

Transparency International, based in Berlin, is a non-governmental international organization against corruption with branches in roughly 70 countries. It favors a holistic approach to a national integrity system.^[1,12] Although each country or region is unique in its own history and culture, its political system, and its stage of economic and social development, similarities exist, and experience and lessons are often transferable. Transparency International proposes a National Integrity System as a comprehensive method of fighting corruption. It comprises eight pillars (public awareness, public anticorruption strategies, public participation, watchdog agencies, the judiciary, the media, the private sector, and international cooperation) which are interdependent. Every 2 years, Transparency International organizes the International Anti-Corruption Conference (IACC).

The mentioned initiatives are part of a more general trend toward anticorruption policies, as, for example, is also shown by the Organization of American States (Inter-American Convention Against Corruption), the European Union, the Council of Europe (and its Group of States Against Corruption *GRECO*), the Global Coalition for Africa, and the International Chamber of Commerce.^[10,14,15]

Criticism

Corruption, ethics, and integrity have become more important topics in international and national political, economic, and social forums, but this does not mean there exists an overall consensus on concepts, causes, and policies. Criticism can still be heard on a number of subjects.

First, there is the question of which interests are best served by the anticorruption initiatives.^[2,10] Optimists see it as a win-win situation: the interests of multinational corporations are served as well as the interests of the peoples of developing countries. Others argue that initiatives of institutions like the World Bank and the International Monetary Fund contribute to the development in the direction of a global free market capitalism and that globalization of that type harms the poor and powerless.

Second, there is the contradiction between the general policy frameworks of, for example, the World Bank, and the notion that there is no “one right way.” Countries are confronted with demands coming from the frameworks, and the room to adapt to national circumstances is limited.

This is related to a third comment. How much consensus is possible and desirable on the ethics of politics and administration? Many frameworks suggest that ethics is universal and based on global consensus. Others argue, however, that the frameworks reflect the values and norms of only a small part of the world.^[3,15] More knowledge of the values and norms reflected in non-Western political and social thought and practice would be useful to come to a more precise picture.

CONCLUSION

A last remark concerns our knowledge of the extent of corruption in countries and the effectiveness of anti-corruption methods and strategies. Most proposals and frameworks are based on experiences and knowledge of anticorruption practitioners and not on scientific evaluation. Although scientific knowledge has increased (as journals such as *Public Integrity* and *Crime, Law and Social Change* show), more comparative research will be necessary to come to more reliable conclusions on the effectiveness of strategies and methods. The same applies to our knowledge of the extent and mechanisms of bribery and corruption in countries.

Governance Networks

Robert Agranoff

School of Public and Environmental Affairs, Indiana University, Bloomington, Indiana, U.S.A.

Michael McGuire

Department of Public Administration, University of North Texas, Denton, Texas, U.S.A.

INTRODUCTION

Governance networks refer to formal and informal structures comprised of representatives from governmental and non-governmental agencies working interdependently to jointly formulate and implement policies and programs, usually through their respective organizations. These networks are a function of “differentiated polities,” characterized by institutional and functional specialization. They bring the non-profit and for-profit sectors together with government in a number of policy arenas, including economic development, health care, criminal justice, human services, information systems, rural development, environmental protection, biotechnology, transportation, and education. The activities of governance are purposeful efforts to guide, steer, control, or manage, in which public and private actors do not act separately but in conjunction, operating as a network. Governance refers to the patterns that emerge from the governing activities of the actors, e.g., coregulation, costeering, coproduction, cooperative management and public-private partnerships.^[1,2]

EXAMPLES OF A GOVERNANCE NETWORK

Three different types of governance networks demonstrate the range of collaborative activities undertaken. First, Sematech, an acronym for semiconductor manufacturing technology, is a public-private development partnership involving the Defense Advanced Research Projects Agency of the U.S. Department of Defense and 14 information technology manufacturers, who jointly invest equal amounts of money in basic research and development designed to restore U.S. leadership in the computer chip industry. Sematech has focused its efforts on a prototype chip fabrication plant that leads to the high-tech equipment that serve as a testing venue for new American precompetitive technologies. The research and development effort improves the competitive stance of all partners. This approach has allowed all of the potentially competing partners to remain involved and invested, and it indirectly serves

the Defense Department’s needs for research and development.

Second, a less formal set of governance networks operate in Michigan in order to create the “Gold Collar” jobs needed to emphasize strategic priorities in advanced manufacturing, information technology, and life sciences. Implemented by its state agency, the Michigan Economic Development Corporation, a number of strategic alliances have been created with the automotive industry, information technology companies, pharmaceutical research centers, medical centers, university research centers, engineering schools, and others. In addition, the state agency staff promotes eight industry cluster roundtables (e.g., automotive, food products, forest products) designed to identify common problems and opportunities, recommend policy and regulatory changes, share and develop technology, promote technical assistance, and forge other new working relationships.

Third, the Applegate Partnership of southern Oregon and northern California is a locally organized watershed governance network that promotes ecologically and financially responsible resource management. The partnership involves industry, conservation organizations, public natural resource agencies, and residents working together on land management efforts through community involvement and education. Applegate’s “signature” project involved the development of a GIS system that integrated BLM, U.S. Forest Service, and county tax lot information.

BACKGROUND AND CONCEPTS

There are many forces that have led to the emergence of governance networks. One important factor is the changing nature of work from labor-based production and services to the integration of knowledge-based symbolic-analytic work, which places greater value on human capital. The basic challenge is that knowledge is specialized and must be integrated collaboratively to solve many problems, a core issue in change management. As a result, government agencies, once thought to be the monopolistic holders of key

information and expertise relating to public issues, now only possess some of the information needed to solve problems.

A second factor is the changing nature of government. The twentieth century was a time of growth of welfare states and, consequently, government agencies and programs at national and subnational levels. The government took on more and more problems and created many new policy arenas. As public efforts grew, however, it became apparent that the government could not garner the resources, investments, expertise, or commitments needed to solve all public problems. Networks involving several organizations became one of a number of collaborative efforts to try to approach some of society's "wicked problems," or challenges that could not be handled by dividing them in simple pieces, in isolation from one another.^[3] A related factor is the idea that government should not only collaborate or partner but also should take on more of a developmental or steering role, promoting, regulating, and encouraging various types of non-governmental activity and operations. This philosophy has, in many fields, unfolded in the 1980s and 1990s, and it has led to greater variety in government–non-governmental organizational interaction.

A number of academic research streams have also confirmed the importance of governance networks. The urban politics work of Clarence Stone on regime theory is perhaps most seminal. In his study of urban power, he concludes that in a fragmented, world where power, resources, knowledge, and the other means to solve problems are dispersed among many individuals and organizations, "the issue is how to bring about enough cooperation among disparate community elements to get things done—and to do so in the absence of an overarching command structure or a unifying system of thought." Governance is the power to combine the necessary elements toward a result, that is, the capacity to assemble and use needed resources for a policy initiative.^[4]

Intergovernmental researchers have also recognized the importance of public and non-public networks, often operating in complex and overlapping fashions,^[5,6] and in many ways, changing the traditional role of governments and their links with non-governmental organizations^[7] and with the various tools and strategies that lead to different public–private configurations.^[8] A study by Radin and associates demonstrates how federal–state–private councils in rural development have recommended many program changes and demonstration approaches in governance.^[9] In the same vein, research on economic development at the state and local levels has demonstrated how these governments enhance their economies by stimulating private sector action, engaging in partnerships with such organizations as chambers of commerce and industry groups, and

working together on developmental policies in human resource development, technology advancement, and global marketing.^[10–12] Finally, research in the environmental policy area also demonstrates that new solutions to such problems as non-point source pollution (e.g., agricultural chemicals), estuary restoration, and forest management can be approached by formally and informally convening government agencies, conservation advocacy groups, industry representatives, land developers, and the scientific community into joint decision bodies.^[13,14]

HOW GOVERNANCE NETWORKS OPERATE

How do governance networks function? [Table 1](#) provides a live example of a formal effort to enhance rural development policy in Iowa. It was called a Rural Policy Academy, because it was part of a program of that name sponsored by the National Governor's Association. A small team guided the effort, led by two state officials, but it also involved several statewide non-governmental organizations involved in agriculture, health, and economic development. Early in the process, the Academy added four state legislators as a means of enhancing its political support. The network brought in dozens of other stakeholders through its work groups in each of the five areas it chose to emphasize strategically. The Academy built upon some 14 existing state rural development programs, using a strategic planning approach that was designed from the start to influence policy and be implementable through state government and several non-governmental stakeholders.

Through a series of retreat-workshops, the Iowa Academy identified the five core areas of emphasis: business development, agriculture and agribusiness, health care, community leadership, and government services and infrastructure. After the key issues were identified, subsequent retreats by the core team reviewed programs, set priorities, and drafted a strategic document. From there, the network was expanded in each of the five strategic areas to include the technical work groups comprised of a broadened group of stakeholders. Those groups ultimately developed a set of policy statements. These draft policy statements were discussed by sets of 25- to 30-person focus groups, who represented even more rural development stakeholders. Finally, the refined proposals were introduced into the state budget and into legislative proposals.

The results of the Academy effort were mixed, because the State of Iowa was facing a budget shortfall during the year of completion. Nevertheless, over a dozen program expansions and new programs were

Table 1 Iowa's rural policy academy: a governance network in action

Network actors	Antecedent programs	Academy aims	Key strategic areas	Sequence of activities	Highlights of results
1. Academy team.	• Rural Enterprise Fund	• Bottom-up rural development	• Business development: agricultural and electrical, non-electrical machinery; 14 industry sectors identified	• Formation of team	• Increases in Agriculture Enterprise Fund to foster linkages with commodity groups, support livestock production policy network
• Iowa Department of Economic Development (DED) Rural Coordinator	• Infrastructure Planning	• Foster interagency and interorganizational cooperation with existing programs—partnerships are key	• Agriculture: new production and marketing technology while addressing food safety and environmental protection; value-adding businesses	• Identification of key strategic issues	• Extension Service project on livestock facility retrofitting
• Director Iowa Department of Management and Budget Representative, Regional Councils	• Tourism Welcome Centers	• Focus on existing problems and future demands	• Health care: maintaining a viable rural health care system through partnerships between the state, private sector, and local leaders	• Workshop retreat: review public and private programs; analyze existing needs and program gaps; set priorities; explore alternative strategies; examine potential coordination efforts	• Increased technology transfer funding
• Director, Iowa Agricultural Development Authority	• Rural Main Street	• State government's role is increasingly that of a facilitator and catalyst for action, rather than that of a direct and sole provider of a service	• Community leadership: assisting rural communities to develop local leaders and organizations designed to improve their growth and services	• Subsequent team meetings to sift issue areas and draft strategic documents	• Enhanced Rural Enterprise Fund
• Iowa Hospital Association Director	• Rural business incubators	• Comprehensive strategy with stakeholder involvement and support	• Government services/ infrastructure: maintain services that are sufficient to promote growth; local governments taking innovative actions to better serve residents and control their own destinies	• Five issue areas are identified and stakeholder workgroups are identified and developed for each area	• Rural leadership program shift to county community leadership clusters and linkages
• Area Development Group	• Rural leadership development	• Creation of an implementation plan		-Second retreat to refine the five issue areas	• Funding for major rural infrastructure assessment

• Iowa Cooperatives Bankers' Association	• Agricultural diversification	• Legislative submission, incorporation in the governors budget, enactment	• Work groups meet to conduct environmental scan and to draft policy statements	• Task Force on "Government of the Future" with the focus on collaborative services and regional institutions authorized
• Federal-State Cooperative Extension Service	• Marketing efforts	• Program development by DED, Department of Public Health, Extension Service, regional centers, and many non-governmental organizations	• Two days of focus group sessions held on each issue area, involving 25 to 30 persons per group	• Funding of plastics technology and graphic arts centers to promote small business networks
• Four legislators, two from each house, each party • Consultant/facilitator (former legislator)	• Office of Rural Health • Regional trade and business centers (16)		• Drafting of final strategy • Introduction of strategic elements into state budget and legislative proposals	• Internet marketing consortium launched • Training program for rural bankers on non-agriculture lending
2. Work group representatives	• Technology transfer foundation			• Entrepreneurship development materials for Iowa schools
• State agency program heads	• Lottery funds for environmental projects			• Establishment of pilot community health system in one rural county
• Federal agency (USDA, SBA, EDA) staff located in Iowa • General farm organizations (FarmBureau, Prairie Fire) • State agricultural commodity organizations • Iowa State University, School of Planning and Design, School of Agriculture, Extension Service	• Quality and productivity enhancement coalition • Road funds to support economic development • Fiber optic telecommunication system			• Public-private task force on retention of health professionals

Source: From Iowa Rural Policy Academy.

ultimately adopted, including enhancing various forms of venture capital, creating several new production networks and consortia, and redirecting other programs. Most important, many of these programs were implemented outside of state government, for example, the pilot rural health system, the Internet marketing consortium, the bankers training, and the rural leadership program. The Iowa Rural Policy Academy demonstrates the concrete actions involved in solving public problems by governance networks.

GOVERNANCE NETWORK MANAGEMENT

Despite the prevalence of governance networks, less is known about how they are managed, because so much of the focus in public administration has been on the hierarchical governmental organization. A few important approaches can nevertheless be advanced. The overriding concern is that networks are not hierarchical and, thus, are not bound by legal authority or by the normal rules and procedures that bind single organizations. Moreover, the importance of knowledge or possession of some other resource, like financing or implementation ability, makes the administrative playing field different than that of a public bureaucracy.

It appears that network actors follow a sequence of activities that is different from the usual planning, organizing, staffing, directing, and so on. The process usually begins with *activation*, or identifying participants and stakeholders and tapping the disparate skills, knowledge, and resources. Then, *framing* follows, which is the process establishing and influencing the operating rules of the network, influencing the governance structures prevailing values and norms, and altering the perceptions of the participants. Next comes the *mobilizing* actions, involving getting the various governance stakeholders to sense a strategic purpose and to establish a common set of objectives. Finally, there are the *synthesizing* activities, that is, the acts of creating the environment and enhancing the conditions for favorable decisions related to the strategic purpose of the network.

Working in a network is behaviorally different than working in an organization. Instead of “motivation,” various forms of shared learning processes are key, which come from interagency task group development and lead to jointly arrived at solutions. Under normal circumstances, decisions are deliberative, creative, and group derived, as organization representatives shed some of their ideologies and personal “baggage” in order to forge redefined problems, a mutual course of action, a multiorganization implementation technology, and diversified methods of resource acquisition. Some argue that these processes are held together by a generally held belief in the overall

purpose of the network, whereas others point to the importance of social capital, which is the stock or built-up reservoir of good will that flows from different interests and organizations working together for mutual productive gain. It is also widely recognized that trust, the obligation to be concerned with others’ interests, is an important ingredient in network behavior.

The presence of collective decision making and shared learning does not mean that issues of power are absent in governance networks. Coequality is a principle that is often professed in networks but is hard to maintain. Beyond the facade of trust and collaboration, stronger partners may be able to take advantage of weaker partners. Some actors sit in positions where their knowledge, financial resources, organization position, or legal authority alters the balance of power. On the other hand, a governance network working together and making reasonable proposals can accrue a great deal of power to create new strategies and policies that carry the support of a wide range of organizations.^[15]

“METAGOVERNMENT”

Operating in governance networks is obviously changing the nature of government organizations, at least in regard to that portion of its activities that relate to policies and programs that are shared with other organizations. Foremost, public agencies, or their representatives, become partners with other organization representatives in examining problems, establishing strategies, and formulating policy responses. Often, the public organization actor serves as the convener, but once the process begins, this person becomes one among many participants. Second, the public agency representative does not have nearly the monopoly or the corner on technical expertise that previous public administrators possessed. Many stakeholders, e.g., scientists, organizational researchers, interest groups, and advocacy groups, bring needed knowledge and information to the governance table. Third, resources are more dispersed. In the past, the government agency possessed the major allocation or appropriation needed to launch a program, and money (and indirectly control) was dispensed through a chain of agencies, public and non-public. Today, the resources are more dispersed throughout the network, as government increasingly tries to use its role in governance to leverage investments by a host of non-governmental organizations.

Fourth, program implementation occurs through many of the same organizations that were involved in formulating strategies and policies. As government has taken on more of a guidance role, and has encouraged non-governmental investments, the carrying out

function is no longer exclusively through an intergovernmental chain of public organizations but involves a variety of grantees, contractees, and collaborating partners. Finally, some analysts have argued that this renders the government agency unimportant, powerless, and a bystander to a series of private actions. Governance networks change the role of government in democratic systems. Government agencies are not, however, marginal players in the multiple organization process. They remain important actors, because they continue to possess a legitimacy to approach public problems and policy solutions, retain important legal authority to set rules and norms, continue to contribute financial resources to programs, and retain some of the needed subject matter and scientific knowledge needed to approach problems. Government agencies are almost always key partners in governance networks.

It is important to note that the notion of democratic accountability may need to be reconceptualized in the light of multiorganizational decision making that lies largely outside of the formal organs of representative government.^[16] There is no obvious principal or agent in network governance and no exigent authority to steer the activities of the network in harmony with elected officials. Interaction between civil servants and representatives of private interest groups, other governmental layers, and implementing organizations makes it hard for representative bodies to influence policy. Network governance may force a shift from concerns with hierarchical accountability to notions of responsibility, responsiveness, and the fostering of democratic ideals. Because an hierarchical control orientation is problematic for collaborative structures, some steps can be taken to maintain the flexibility of collaboration while ensuring accountability.^[17] For example, collaborative processes can be developed as supplemental to, not exclusive of, normal decision-making processes. The activities of networked arrangements could be reviewed by independent, ostensibly objective, sources. Additionally, collaborative decision making can strive toward achieving agreed-upon performance measures that capture the intent of policy objectives, and the home agencies of collaborative decision makers can monitor and evaluate the network's progress toward achieving the desired objectives.

FUTURE OF GOVERNANCE NETWORKS

The future will put these collaborative decision structures at the core of organized efforts. Knowledge is an increasingly important resource, a new capital that resides in human resources or knowledge workers, who will continue to need some form of collective that will

bring them together. Knowledge is non-hierarchical, in that if it is required for a situation, professional performance needs to be applied, regardless of organizational position, social status, or possession of wealth. As a result, portable knowledge application plus rapid access to information can and has led to the disintegration of large-scale organizations into more flexible structures, such as the identified partnerships, joint ventures, alliances, and other governance structures. In the future, several different types of organizations are expected to interlock along these lines. These trends will also accelerate the need for greater study of the new forms of organizing and operating. As Peter Drucker maintains, "Despite all the present talk of 'knowledge management,' no one yet really knows how to do it."^[18] Finally, these structures will increasingly be used to deal with social problems. David Korten concludes that knowledge and reformation have provided powerful new collective intelligence that can be used to master social and institutional discovery and innovation through problem solving.^[19]

Government Failure: Theory

Thomas S. Nesselin

Urban and Regional Studies, Department of Economics, University of Wisconsin-Green Bay,
Green Bay, Wisconsin, U.S.A.

INTRODUCTION

In *The Wealth of Nations* (1776), Adam Smith presented the basic case for the comparative efficiency of a capitalist market economy. According to Smith, within a competitive economy, an *invisible hand* turns self-interest toward the common good. The modern counterpart of Adam Smith's invisible hand conjecture is the so-called *Fundamental Theorem of Normative Economics*. Using highly sophisticated mathematics, economists such as Kenneth Arrow and Gerald Debreau were able to prove that under certain conditions—albeit highly restrictive—a perfectly competitive economy will result in an efficient allocation of resources.^a

In the twentieth century, however, economists began to investigate seriously under what specific conditions a market economy might fail to achieve efficient resource allocation. Modern textbooks present a fairly standard list of market failures. Markets are argued to fail in the following key ways: 1) monopoly; 2) collective goods (e.g., national defense, the legal system, etc.); and 3) externalities or external effects (e.g., pollution). More recently, the theory of market failure has been extended to include the ubiquitous problem of costly information and incomplete markets.^[2] This broader more refined analysis of market failure suggests a potential role for government to improve the efficiency of, for example, major insurance markets and capital markets. To date, most undergraduate textbooks, however, have yet to incorporate this broader analysis of market failure.

Theories of market failure are without doubt an important analytic framework for helping policy analysts discern potential government policies that may improve the efficiency of the economy. However, the application of market failure theory is an incomplete, and sometimes invalid, guide to efficient public policy making. In brief, for much of the twentieth century, there was a strong tendency by policy analysts to

simply assume away the possibility of government failure. In essence, policy interventions were implicitly assumed to be perfectly implemented by a benevolent, all-knowing, and all-powerful entity called “Government.” This point was stressed initially by members of the Chicago School of Political Economy, such as Coase,^[3] George Stigler, Milton Friedman, and Harold Demetz. Demetz presented a concise but particularly cogent argument in this respect:^[4]

The view that now pervades much public policy economics implicitly presents the relevant choice as between an ideal norm and an existing “imperfect” institutional arrangement. This *nirvana* approach differs considerably from a *comparative institution* approach in which the relevant choice is between alternative real institutional arrangements. In practice, those who adopt the nirvana viewpoint seek to discover discrepancies between the ideal and the real and if discrepancies are found, they deduce that the real is inefficient. Users of the comparative institution approach attempt to assess which alternative real institutional arrangement seems best able to cope with the economic problem; practitioners of this approach may use an ideal norm to provide standards from divergences are assessed for all practical alternatives of interest and select as efficient that alternative which seems most likely to minimize the divergence.

INEFFICIENCIES OF POLITICAL INSTITUTIONS: A FEW ILLUSTRATIONS

Criticism of the market failure paradigm as the sole guide to policy interventions stimulated many scholars, in particular, members of the so-called *public choice* school, to examine the question of government failure. Rather than assuming that political actors generally pursue the public interest or common good, public choice analysts posit that political actors have their own agendas and generally seek their self-interests. They then employ the analytic tools of economics to explain the outcomes of the political process and governmental institutions. The public choice literature has many books and articles on the causes and consequences of a large range of government failures.^[5–11] Often, analysts, in particular textbook authors, simply

^aThe Fundamental Theorem of Normative Economics establishes that a competitive economy will result in a Pareto-efficient allocation of resources. That is, the competitive price mechanism will lead to adjustments such that it is not possible to reallocate resources in any way that will increase the satisfaction of one party without decreasing the satisfaction of some other party.^[1]

present an unorganized listing of what they believe to be important reasons for government failure. A modest improvement in this respect, perhaps, is to relate key government failures to deficiencies in one of the three fundamental structures of all social choice mechanisms, whether market or non-market, namely, the *decision-making* structure, the *information* structure, and the *incentive* structure.

To begin, in a competitive market economy, consumers are able to channel their preferences to producers and make them effective, via their dollar votes in the marketplace. Each consumer, within the limits of their budget, can purchase exactly the quantity and quality of goods and services they desire. Absent market failures, the decentralized decision-making structure of a market economy results in efficiency, i.e., resources are allocated to those lines of production that maximize society's net benefit.

In contrast, the use of a more centralized social decision-making mechanism, namely, collective or political choice mechanisms, often presents major problems in efficiently channeling the preferences of voters and making these choices effective. One method for making social choices is via direct democratic referendum, where the preferences of 50 plus 1 of the voters decide the issue. Clearly, a key problem of a majority decision-rule is that the preferences of a lukewarm and small majority may dominate the preferences of an intense minority. For example, perhaps a majority of voters in a school expenditure referendum are willing to pay a small increase in taxes per year, whereas a large minority may actually desire a significant decrease in taxes. Such a situation may easily lead to an inefficient level of school spending and taxation because of the inability of a majority voting rule to account for the intensity of voter preferences.

Of course, in modern democracies, the bulk of collective decisions are not made by referenda but by elected representatives. Perhaps the central problem of representative government is that the outcomes of the political process often fail to reflect society's general interest, and instead, they reflect the interests of organized groups (i.e., so-called *special interests*). Often, these organized interest groups seek legislation that makes wealth transfers to them at the expense of society in general, the classic example being tariff and other trade barriers protecting favored industries from more efficient foreign competitors.

The basic reasons for inefficient special interest legislation are straightforward. First, for most voters, the cost in time, effort, and money of being well-informed on a large number of public policy issues are large relative to the benefits to them. Consequently, it is rational for most voters to remain uninformed on most policy questions. Obviously, voter ignorance greatly impedes the monitoring of their political

representatives. Second, self-interested political representatives generally place a high priority on getting re-elected in order to continue to enjoy the perquisites of political office. Finally, the influence of special interest groups is greatly increased, because organized interest groups have the means and incentive to be the primary providers of political funding. It is not difficult to see that in political systems where the political funding is paramount to elector success and where the perquisites of political office are exceedingly large, special interest legislation will be especially pervasive.

A second major cause of government failure relates to information deficiencies on the part of voters. Two basic sources of information deficiencies are the following. Again, a fundamental problem is that it is rational for the bulk of voters to be uninformed on most political issues. Greatly compounding this inherent problem is the fact that self-interested politicians have strong incentive to structure policies and programs so as to systematically exaggerate potential benefits while concealing the true social costs. For example, in the United States, the Social Security pension system is financed by a payroll tax on workers and a mandated matching employer contribution. Yet, economists generally agree that workers actually bear the full burden of financing social security, as the employer contribution results in a corresponding reduction in wages in the long run.

A final major source of government failure relates to the large range of incentive problems. Much of government activity is accomplished via government agencies and enterprises. Analysts have long noted that public-sector managers confront a set of incentives that generally undermines efficient performance. In particular, government agencies and firms fail to be disciplined by the threat of bankruptcy or outside takeover, while at the same time soft budget constraints provide incentive for increased expenditure and a lack of cost consciousness. Compounding basic incentive problems is another, often overlooked, cause of public-sector inefficiency noted by Shleifer:^[12] "In other words, state firms are inefficient not just because their managers have weak incentives to reduce costs, but because inefficiency is the result of the government's deliberate policy to transfer resources to supporters."

TOWARD A THEORY OF GOVERNMENT FAILURE

While numerous, rather narrow, articles have been produced examining various aspects of government failure, "few writers have tried to synthesize this literature to construct a theory of government failure that parallels that of the market."^[13] The major exceptions are studies by Wolf, Le Grand, and Vining and

Weimer.^[5–11,13,14] While each of these studies provide valuable insights toward the development of a theory of government failure, to date, no complete and fully adequate theory of government failure exists. Dollery and Worthington provided an excellent concise critique of the government failure literature.^[15] Three key general criticisms made by them are as follows:^[15]

[I]n at least two respects extant public choice theory does not provide policymakers with a conceptual analogue of the market failure paradigm to inform public policy decisions. Firstly, the public choice approach is positive, and not a normative, theory of government processes, and thus cannot provide an idealised or optimal vision of policy intervention against which actual government behaviour can be compared, in the same way as welfare economics furnishes the theory of market failure with a yardstick to evaluate real-world markets. And secondly, public choice theory is premised on the behavioural posulate of *homo economicus* and follows methodological individualism, which may not always capture the full intricacies of politicised policy environments ... [Finally,] effective policy analysis requires a general theory of organisational failure, rather than conceptually distinct theories of market failure and nonmarket failure. This has been recognised by Williamson (1989) who has argued that "... all forms of organization, not just markets, need to be assessed comparatively"

CONCLUSION

What is to be done, then, to aid the policy analyst in making policy choices in a world of imperfect markets and imperfect government? Le Grand's approach appears to be one potentially useful path to follow.^[13] In brief, Le Grand attempted to provide a more general policy analysis by focusing on the three basic ways that governments intervene in a market economy and then assessed these three interventions in terms of efficiency and equity criteria. Le Grand provided a concise and basic analytical discussion of direct government *provision, taxation and subsidy, and regulation*. To be of much use for policy making, however, a more extensive theoretical development is needed. For example, a more precise and refined theoretical analysis of the optimal scope of government and private provision is now available to be incorporated into Le Grand's analytic framework.^[2,16]

Perhaps even more important is the increased production of high-quality empirical research that carefully assesses real-world market outcomes relative to real-world outcomes of various forms of political allocation. As several writers on government failure have noted: The choice between markets and political

allocation is ultimately an empirical question. One prominent example is the rapidly growing, improved empirical research concerning the privatization of state-owned enterprises.^[17,18] Another good example is the improved comparative research of alternative housing systems, where major differences in performance can now be discerned between market-oriented housing systems and various *planning* systems.^[19,20]

Government Performance and Results Act of 1993: A Retrospective

G.L.A. Harris

Mark O. Hatfield School of Government, Portland State University,
Portland, Oregon, U.S.A.

INTRODUCTION

The quest for government performance and accountability took its most recent form as the Government Performance and Results Act (GPRA) of 1993. There have been similar, numerous attempts to make the federal government in the United States accountable since the 1940s. This selection will explore the metamorphosis of government performance and accountability at the federal level; assess whether or not the federal government has achieved its targeted objectives; and achievement or not, whether the federal government can incorporate lessons learned to improve performance and accountability.

WHAT IS THE GPRA OF 1993?

The GPRA of 1993 (PL-90-481) sets four basic goals to improve: 1) the public's confidence in the federal government; 2) the effectiveness, efficiency, and accountability of federal programs by focusing on results; 3) "... congressional decision-making by providing more objective information on achieving statutory objectives" (p. 4); and 4) the internal management of the federal government.^[1] Thus, the goal of GPRA, according to Committee Chairman Tom Davis (R-Virginia), is to refocus the federal government's attention on performing and accomplishing results rather than on the process.

GPRA mandates that each federal administrative agency develop three plans for submission to Congress. The first is a five-year strategic plan to be updated either every three years or as suggested or required. The second, an annual performance plan, details the shorter term goals and measurements of the five-year strategic plan. Additionally, the necessary resources, including budget and human capital, are delineated in how goals will be achieved. Third, an annual performance report, states whether and how the intended goals were actually achieved.

GPRA strives to increase transparency by aligning government accountability and performance with the budgetary process. According to former President Bill

Clinton, "The law simply requires that we chart a course for every endeavor that we take the people's money for, see how well we are progressing, tell the public how well we are doing, stop the things that don't work, and never stop improving the things that we think are worth investing in."^[2]

GPRA IN THE MAKING

Federal government leaders have given the highest level of government its historic role as a model organization for lower levels of government and even the private sector. As a result, and more actively since the late 1940s, federal policymakers have engaged in a series of administrative reforms to deliver services more efficiently and cost effectively. Previous reforms have come in the forms of the Lodge-Brown Act of 1947 under President Truman's Hoover Commission; the Johnson Administration's Planning Program Budgeting System (PPBS); Management By Objectives (MBO) during the Nixon era; President Carter's zero-based budgeting; and the Reagan Administration's Grace Commission.^[3-6] To that end, GPRA represents one of the largest and latest in a long line of statutes directed at government reform.

President Clinton's National Performance Review (NPR), later in the 1990s, was an ambitious reform in the federal government declaring that "the era of big government is over."^[7] Based largely on principles touted in Osborne and Gaebler's^[8] *Reinventing Government*, the National Performance Review (NPR) embodied goals to improve performance within the federal government. These goals included evaluating the efficiency of agencies; identifying and eliminating waste within those agencies; streamlining the federal civil service system; changing the culture within the federal government; and empowering federal government employees.^[9] Reinventing government springs from the argument that the federal government should be decentralized to unleash the "entrepreneurial spirit" of employees who would, in turn, change the culture of their work environments.^[9] However, government cannot be run like a business because it

is a “fundamentally different” structured sector.^[8] What is needed is better government or one that promotes better governance.

Finally, in a bold attempt to revolutionize how we conduct the business of government, President Clinton signed into law the GPRA on August 3, 1993. The new initiative, under the leadership of the then Vice President Al Gore as the NPR, sought to improve the way that the citizenry received services by instructing federal agencies to solicit feedback from customers to find out what they want, establish standards for the delivery of services, and benchmark “best in class organizations” in the public and private sectors providing a wide variety of services.^[11]

But, unlike previous reforms, GPRA emphasized the output and outcomes of government programs and activities, not processes.^[12] Focus must, therefore, be on what the private sector calls the “the bottom-line.”^[15] NPR served as a major, and probably the most prominent, arm of GPRA by calling for federal agencies to accomplish the following:

- Establish customer standards to improve products and services.
- Establish performance agreements between the President and each federal agency Cabinet Secretary. Agencies must establish contractual agreements and cascade them to subordinate units in the form of performance goals and objectives that are strategically aligned with each organization’s mission.
- Create “reinvention labs” (p. 75) in federal agencies to experiment with ways to streamline processes and reduce or eliminate the amount of controls exercised by agency heads over their organizations.
- Forge performance partnerships between the state and local governments with the federal government by granting greater flexibility to states and local governments in administering federally funded and/or mandated programs, in exchange for more accountability and results.

The Clinton Administration believed that “citizens deserve to receive the highest quality services for their tax dollars.”^[10] GPRA did not call for cost-cutting measures per se, but its simultaneous enactment with NPR occurred with the push for a balanced budget.^[13] It was, therefore, perceived that GPRA served as a continuation of NPR’s goal to do more with less.

The intent was that accountability at the federal level would trickle down to state and local governments as citizens became intolerant of the practice of business as usual. This kind of accountability, it was believed, would be best achieved by benchmarking the best practices of “best in class organizations” within the public and private sectors.^[11]

Reinventing government changed the way that the federal government chose to conduct business. First, a reduction of the federal workforce by 240,000 reduced the size of 13 of 14 federal agencies and rendered more than 2000 field offices obsolete and eliminated some 200 programs.^[7] Second, \$118 billion in savings were derived from changing the manner in which the federal government operates by reducing the costs of purchasing items to reduce the costs of processes for the most frequently used products and services.^[7] Further, four consecutive years of deficits resulted in an accumulated reduction of \$476 billion for the federal government.

Third, service to the public became more customer oriented, rivaling that of organizations within the private sector.^[7] For instance, a survey revealed the superior performance of the Social Security Administration’s 1–800 telephone service. Fourth, the federal government eliminated unnecessary regulations and forged partnerships with other federal agencies.^[7] This move resulted in the elimination of some 16,000 regulations while simplifying another 3,000.

Lastly, states are asked to experiment with reform in such areas as healthcare and welfare.^[7] In essence, government is attempting to improve working with and in the communities that it serves.

EVALUATION OF GPRA TO DATE

The GPRA of 1993 forced accountability for program, policy and agency results by systematically holding federal agencies accountable for achieving program results; federal agencies must focus on results, not the process to increase efficiency, effectiveness and accountability; federal agencies must provide more objective information based upon statutory objectives to improve decision-making by Congress; and federal agencies must improve their internal management.

GPRA, sometimes known as the “stealth law,” came with great expectations given its anticipated accomplishments.^[14] During the hearing, John Koskinen of the Office of Management and Budget (OMB) said, “If GPRA carries through on its promise, I am confident it will ultimately be viewed as one of the most important pieces of legislation enacted in this decade and will change the dialogue between the public, the Congress, and the Executive Branch about government programs and their goals, performance, and funding” (p. 13).

However, Congress acknowledged that one of the difficulties accompanying any major legislation is its implementation and lack of resources in ensuring successful implementation. From the start, problems emerged. Koskinen conceded that approximately seven of the 77 federal agencies originally part of the pilot on

GPRA, dropped out citing overestimation of their capacity to meet GPRA's performance measurement goals. The OMB asked that these agencies justify why managers experienced such difficulties. Nevertheless, Koskinen added, that the OMB and other agencies could learn more from these failures than from successes.

At the same hearing, Johnny Finch of the General Accounting Office (GAO), envisioned five challenges in implementing GPRA.

- Getting the buy-in and ongoing commitment from agency heads. Part of the problem was due to high turnover as many of the agency principals are political appointees. Further, the average tenure of these appointees is two years. GPRA's goal is to sustain commitment throughout the tenure (s) of multiple political appointments.
- Ensuring that participating agencies have the capacity to meet the performance measurement requirements of GPRA.
- Installing change incentives to facilitate a move from process orientation to outcome orientation. GPRA prescribed that a change in behavior required securing and sustaining the commitment of agency heads.
- Incorporating GPRA into the daily operations of agencies. It is believed that many federal agencies are far from identifying and using outcome measures as intended by GPRA.
- Congressional oversight. Effective Congressional oversight is crucial in ensuring agency accountability for outcomes using performance measurement. Further, Congress is a major stakeholder in ensuring that GPRA is correctly implemented.^[15] Therefore, lack of oversight could prove fatal.

Given these challenges, Congress employed a phase-in approach to GPRA. Implementation would be incremental and it is crucial that agencies identify factors that pose the greatest threat to implementation. Some agencies cited environmental factors that were unique to them. Two such environmental factors were the economic expansion and contraction experienced during business cycles and the delivery and provision of certain services through third parties.^[16]

Congress mandated that agencies develop strategic plans by September 1997; submit annual performance plans following the President's budget in the beginning of 1998; and in the fiscal year 1999, begin to report to the President and Congress on their progress towards agency performance in accordance with goals for that period. Strategic plans were first developed for each five-year period in alignment with agency mission, strategic goals and how these goals were to be achieved. Strategic plans were then to be incorporated into the

daily activities of each agency by identifying performance indicators, performance goals and the level of resources needed to meet them. Given the regulatory nature of many agencies such that results would not be apparent for long periods, Congress endorsed the use of intermediate goals. Finally, annual performance reports served as a way to determine whether intermediate goals were being achieved.

A GAO (1997) study of five federal agencies: Occupational Safety and Health Administration (OSHA), the Federal Aviation Administration (FAA), the Food and Drug Administration (FDA), the Internal Revenue Service (IRS) and the Environmental Protection Agency on what enabled yet impeded attempts to focus on results rather than inputs, found the following.^[16]

- GPRA forced agencies to move from a culture of process-orientation to one of results-orientation.
- GPRA enabled agencies to receive training for developing performance measures. Training helped to secure feedback from stakeholders, to include Congress, the public, private industry, other agencies at the federal, state and local levels of government, and various interest groups.
- Some agencies cited a conflict of interest given their diverse clientele compounded by what the agencies deemed as "inconsistent statutory requirements" (p. 13). This made it more cumbersome in determining what the agencies' goals should be.
- As is the case with the IRS, given enforcement responsibilities, federal law prohibits the evaluation of employees on the basis of these results.
- Data collection was challenging in determining what data was needed to improve results. Some agencies, like the FAA, found itself trying to identify negative data to justify the degree of improvements that have been made to avert accidents through the improvement of, say, airport runways. Another difficulty was, given the complexity of factors that may potentially influence an agency's decision, and due to the lack of control over these factors, performance measures were difficult to establish. The long incubation period for achieving results was another frustration for some agencies.
- Some agencies experienced inconsistencies in priorities including some Presidential initiatives vying with new and old agency initiatives and strategic plans between the process-orientation of those priorities and the results-orientation called for by GPRA.
- Limited resources constrained some agencies' capacity to fulfill many requirements of GPRA. For example, OSHA was limited to conducting no more than two studies per year to determine the impact of certain regulations on workplace safety. The FDA, too, found it difficult to transfer

resources from “high priority risks” (p. 17) to develop a statistically credible baseline for measuring industry compliance.

While the 1997 study represented an undertaking that was early in the GPRA process, the initial drop-outs from the pilot of 77 federal agencies and the current five agencies experiences, indicated that GPRA’s implementation was disappointing.

According to a Congressional Research Service (CRS) report,^[17] federal agencies have a long way to go in meeting the requirements of GPRA.^[18] First, analyses by the CRS identified problems from data systems that were too incomplete to evaluate outputs and outcomes; limited resources and strategies to achieve goals; and insufficient coordination with fellow agencies. The CRS recommended that committees oversee and determine whether agency goals align with policy objectives, that performance measurements be specified in GPRA and that committees monitor agencies to ensure that they are measuring and meeting performance goals.

Second, the GAO argued with the CRS that “... progress is needed in how agencies ... set ... a strategic direction, coordinat(e) ... crosscutting programs, and ensur(e) ... the capacity to gather and use performance and cost data.”^[19] Several heads of House Committees also requested that the OMB ask that the federal agencies align their fiscal year 1999 budgets to the goals in their strategic plans. Congress mandated that these performance goals be measured in quantifiable and objective terms with information as to how the results, based on these goals, could be verified and validated. Further, the findings were that a “culture change” (p. 4) was needed together with the Congressional oversight and leadership of the OMB.

Third, the GAO’s evaluation of agency performance plans for fiscal years 2000 and 2001 found that approximately 60 percent of 35 of the fiscal year 1999 annual performance reports did not align funding requests with explicit methods for reaching performance goals.^[20]

The OMB later called for agencies to link budgetary requests and estimates with performance goals.

Christopher Mihm, also of the GAO, stated that while the importance of GPRA is widely known, it has not necessarily been accepted and is far from inculcated into the federal government.^[19]

The move from process-orientation to results-orientation has been difficult to cultivate given the lack of leadership. Many federal agency middle managers perceived that there is no commitment by top management to such goals. This, they say, would require a “cultural transformation” (p. 12).

Senator Fred Thompson (R-Tennessee) complained that after two rounds of performance reports for fiscal

years 1999 and 2000, the results had revealed that there is much left to do in carrying out a cultural shift. Thompson observed that state and local governments had been more successful. He noted that the federal government had not lived up to the goals that continue to burden the system and stifle its ability to change. The senator admitted that federal agencies had progressed in the right direction, but at a very slow pace.

Fourth, the GAO (2001) confirmed some previous findings and ongoing difficulties with implementing GPRA.^[21] These findings concluded that less than half of the managers in at least 11 federal agencies sensed little to no commitment from agency leadership. Less than half of the managers at 25 agencies felt that employees received systematic recognition for helping to develop performance measures that related to agency strategic goals. Less than half of the managers in at least 22 agencies were asked to be accountable for programmatic results with only one agency showing that more than half of its managers felt that they had the decision-making authority to achieve strategic goals. However, 84 percent of agency managers surveyed felt more involved in performance measures. This represents a 12 percent increase over the 1997 GAO study.

According to the GAO (2001), the federal government has failed to realize the importance of human capital in implementing GPRA. Specifically, the government failed to recognize that succession planning could identify talented and qualified personnel for continuity in leadership. Agencies had not made a significant effort to align leadership performance expectations to agency mission. Problems were compounded by the absence of competitive compensation schemes to recruit, reward, motivate, and retain quality personnel. Managers failed to assess agency staffing needs and strategically deploy personnel to meet these needs. Few linked performance expectations with core competencies to achieve results. And, most agencies failed to collaborate through collective bargaining to achieve results.

Fifth, and on the positive side, GPRA is considered to be an excellent tool for helping to identify management capabilities and problems that may adversely impact an agency’s mission.^[21] Additionally, the GAO notes that it is equally important for agencies to identify their capacity to meet performance goals and link budgetary requests to meet results. Further, where there is the potential for overlap or crosscutting of functions, effort should be made to coordinate or engage in partnerships with other agencies to eliminate duplication and fraud, waste, and abuse. The GAO argued that managers must use credible performance data that is verifiable and valid.

The Bush Administration has attempted to bolster accountability and thus GPRA, through the Program Assessment Rating Tool (PART) to link funding

resources to performance.^[22] PART, which employs data from GPRA to help the Executive branch make budgeting decisions, uses a programmatic approach requiring a five-year phase-in implementation period by federal agencies. PART has forced federal agencies to generate performance measures that justify funding. PART assists agencies in focusing on where their most scarce or most important resources are needed to meet strategic mission goals. GPRA and PART are, therefore, viewed as complementary although PART primarily serves as a budgeting tool for OMB and the President. PART represents an exercise that integrates budget decisions with performance results; GPRA focuses on how performance goals are achieved. PART signals a new wave in accountability and performance and helps decision-makers focus on pressing policy issues while considering the costs and risks of doing so. Finally, despite the deficiencies, GPRA has shown some promise.

Maurice McTigue, of George Mason University, said that the impact of GPRA appears to be taking hold.^[22] He cautioned, however, that his optimism is based on only four years of data and the experience of various federal agencies. Further, this information is inconclusive.

- More agencies have become familiar with GPRA and received the attention of senior leadership.
- The most recent round of annual performance reports reflecting the strategic goals for the fiscal year 2002 have shown marked improvement over fiscal year 1997.
- Agencies have become experienced in managing performance measures to produce desired results. Agencies now do a better job of quantifying their services but still have problems translating these measures to determine the benefits to clients.
- As agencies become more competent in implementing GPRA, they improve the performance indicators that measure outcomes.

McTigue recommends that, in concert with GPRA, PART can be used as an evaluation tool to gauge budgetary decisions based on outcomes. However, he cautions that PART should not replace but be used in concert with GPRA to achieve strategic goals. He also views the President's Management Agenda (PMA) as the most recent technique to augment PART in helping federal agency managers recognize that their budgets are at stake and any allocation is directly tied to agency and/or program performance. McTigue believes that full disclosure of this information will help to determine which stakeholders are being best served and use the information to make better resource allocation decisions in the future.

More recently, the GAO (2004) found some evidence of improvement under GPRA.^[23] Interviews

with focus groups and political appointees as well as OMB officials credit GPRA with helping them through the planning and reporting process toward developing results-oriented performance measures and making use of such measures. Although the reviews are still mixed, more federal agency managers, particularly those at the Senior Executive Service (SES) level, believe that the OMB is acknowledging their efforts. By requiring that agencies develop five-year strategic plans from which annual plans and annual performance reports are based, agencies are forced to align goals and objectives to the mission through performance indicators to achieve results. Failure to do so would result in an agency falling short of its annual plan that is reflected in its annual performance report. This, in turn, could result in Congress' decision to decrease funding to that agency.

However, while the agencies have made remarkable strides in acceding to the spirit as well as the letter of GPRA, they still have a long way to go.

Great expectations were associated with the enactment of GPRA. However, as with any major legislation, significant and unexpected growing pains became evident in its implementation.

- Difficulties in securing the commitment of agency principals was only one of the many challenges encountered.
- The goal that federal agencies must focus on results rather than on process has been an ongoing struggle. This required a culture change for those at the helm as well as those directly charged with GPRA's implementation.
- Many agencies were ill equipped to determine their performance measures much less develop five-year strategic plans. Further, agencies failed to align performance expectations with agency missions.
- Federal agencies were to improve their internal management but lacked the resources to ensure successful implementation.
- Yet, many federal agencies have found GPRA to be instrumental.
- The GPRA helps to identify what they can and cannot do as well as the potential impact on agency mission.
- The Bush Administration has recognized the importance of GPRA by aligning agency performance with budgetary decisions through PART.
- There has been evidence that since GPRA, agencies' familiarity and experience is beginning to improve performance measures that agencies develop.

CONCLUSIONS

This article has attempted to unearth the many gallant trials at reforming government by holding it

accountable for performance. From the 1940s through the 1990s, such reforms have attempted to move the federal government ever closer to efficiency and effectiveness. GPRA represents one of these attempts.

Benchmarking, when used appropriately, has proven to be effective. Moreover, when goals are presented in a clear manner and systematically measured and tracked against best practices, government works.^[24] But unless the leadership from which such benchmarks emanate embraces change by preparing the organization for a cultural shift in thinking as well as in doing, implementation will be feigned and doomed to fail. Additionally, if implementation occurs and organizations are ill-prepared, public managers will continue to use outdated and familiar modes of thinking and doing in responding to new challenges. Such is the case with GPRA. When public managers are equipped with the right tools and environment in which to succeed, they prosper. The key is finding these tools.

Government–Business Relations in East Asia

Sung Gul Hong

Department of Public Administration, Kookmin University, Seoul, Korea

INTRODUCTION

Government–business relations refer to the enduring institutional relationship between government and business in the economy and society. There can be a variety of forms in shaping the relationship depending on the particular historical and industrial development experiences. Culture and institutional legacies are certainly important in shaping the relationship as well.

East Asian countries, mainly refer to Japan, South Korea, Taiwan, and China in this paper, have some important commonalities in their government–business relations. In addition to the cultural affinities and geographical proximity, they are typical late developers, meaning that the government intervenes the market intentionally to achieve rapid economic and industrial development. Because the economic performance is a direct outcome of business activities that are closely related to government policies, government–business relations are critical in understanding East Asian economic development. Despite the debate on whether the state or market has been the primary engine of development, it is apparent that the government has been very active in promoting particular industries and economic development in general. Yet, there are also important differences in government–business relations mainly due to the diversities in political regimes, ideologies, economic institutions, and political experiences as will be discussed later in this paper.

At the center of the rapid economic development in East Asian countries, there were very strong authoritarian governments. The authoritarian government has been insulated from society, according to which it could effectively control interest group activities, especially repressing the labor union activities while maintaining close ties with the business. By doing so, East Asian developmental states could secure the labor peace, one of many preconditions for late development. As such, the government–business relationship in East Asian countries was something like “corporatism without labor” as Pempel and Tsunekawa once pointed out.^[1] But the close government–business ties could be maintained only when the business continued to cooperate with the government to achieve the preset and widely shared developmental goals. Otherwise, the government might severely punish the business with a variety of policy tools and institutional mechanisms inherent in the authoritarian regime.

Government–business relations, however, has not been constant over time and across industrial sectors. In fact, the very economic success of East Asian countries has been a fundamental source of the changing government–business relationship. As development proceeds, the business becomes more powerful and influential in the capitalist economy. State autonomy has waned over time, and the government became increasingly dependent on the performance of the business. Industry associations, once played the role of close partners to implement government policies, began to make stronger voices to reflect their particular interests in policy formation. In addition, economic affluence provided more opportunities for the mass education. The more the people got educated, they began to resist the political dictatorship that was common in Taiwan and Korea. As such, political democratization was in due course, according to which the demand for redistribution grew rapidly.

Recently, wide application of Information and Communications Technology (ICT) in everyday lives makes political participation much easier than before by reducing transaction cost of political participation dramatically. The development of ICT infrastructure and the electronic government stimulate active political participation, and active interest group representation both through online and offline become prevalent as in the western democracies.

In the following sections, I will begin with the explanation of typical government–business relations in East Asian countries under the broad context of the developmental state. Overall policy environment and institutional mechanisms that allow a dominant position to the government over the business will be analyzed in detail. The impacts of information technologies upon society will be discussed in order to forecast the future of government–business relations in East Asia.

GOVERNMENT DOMINANCE OVER BUSINESS: AN OVERVIEW OF GOVERNMENT–BUSINESS RELATIONS IN EAST ASIAN COUNTRIES

Government and Business in Preindustrial Stage

Before modernization, a strict status system was maintained in all East Asian countries, in which the aristocratic class monopolized political and military power.
